The entrepreneur's goal is to "create or capitalize on new economic opportunities through innovation—by finding new solutions to existing problems, or by connecting existing solutions to unmet needs or new opportunities" (Lichtenstein and Lyons, 1996). We highlight here six methods that can be used to foster an entrepreneurship local economic development strategy; these are elaborated on to some extent in other sections of this chapter.[1]

1. *Develop diverse sources of capital.* This can be local venture capital firms, organized networks of angel investors, and public or private seed capital funds.
2. *Create an enabling community culture.* This should be founded on the entrepreneurs' common vision for the community's future, their commitment to giving time and money back to the community, and their willingness to share ideas and information.
3. *Foster networking.* "Consummate entrepreneurs are networkers who thrive in communities. Networks are essential because they link entrepreneurs to potential sources of capital, new employees, strategic alliances, and service providers such as lawyers, accountants, and consultants" (Edward Lowe Foundation, 2002).
4. *Provide supportive infrastructure.* Perhaps most significant is the presence of a local college or university because of its role in education, R&D, and fostering an open-minded, risk-taking local culture. However, more traditional infrastructure, such as transportation and high-speed Internet access, is also important.
5. *Make government entrepreneur friendly.* Local governments that streamline processes work in a spirit of entrepreneurship instead of bureaucracy, so it is easier for local entrepreneurs to do business.
6. *Foster entrepreneurship education.* This education should be targeted to primary and secondary schools as well as adult education. Linking entrepreneurship with education develops human capital and makes this method of economic development more sustainable (Dabson et al., 2003).

Cities can facilitate the identification of people with entrepreneurial talent and interests and develop them via the creation of social and professional networks as well as through secondary and postsecondary education programs.

Social and professional networks connect business owners with service providers as well as grant access to resources, materials, labor, financing, and new markets. Mentoring, another critical aspect of fostering entrepreneurship, occurs on a voluntary basis. The cost for both networks and mentoring programs is typically small and supports logistical and organizational activities.

Youth business programs can be established in high schools, while entrepreneurial training programs can be established in the junior or community colleges. Some big-city newspapers such as the *Oakland Tribune* in California have sponsored business start-up fairs and training sessions to release local entrepreneurial talents in the resident population.

While it is difficult to compare the budget of an entrepreneurial strategy with those of traditional business recruitment incentive packages, it is clear that the costs of this strategy can be significantly lower than the latter category of economic development expenditures. For example, the incentive packages that seven states offered in 1996 for just a single manufacturing plant ranged from $2.35 million to $12.475 million (Spicer, 1996). In contrast, the 2005 total budget for a Littleton, Colorado, economic gardening strategy (described next) was $600,000, or one quarter of that of the lowest amount spent on a single manufacturing plant by any of the seven states in the mid-1990s.

Entrepreneurial Community Program: Growing an Economic Garden

In 1987, the City Council of Littleton, Colorado, decided it wanted to grow jobs by fostering entrepreneurship within the community rather than by recruiting companies to relocate to or expand in the area.[2] It developed an economic gardening program based on the idea that business success comes from three places: (1) an ability to adapt to changes while retaining an identity, (2) a sense of self-organization that encourages action at the individual level versus top-heavy organizational structures, and (3) a local culture that favors risk taking, innovation, and diversity (Gibbons, 2005).

Littleton's economic gardening program has three core activities. First, it provides tactical and strategic information to existing or potential local businesses. This is called "competitive intelligence" (Society of Competitive Intelligence Professionals, n.d.)[3] and involves providing information to local Littleton businesses that is usually available only to large companies. The intelligence provided can include marketability studies, the tracking of new products, legal research, and answers to specific business questions.

Second, Littleton has ensured that necessary infrastructure improvements were made for supporting business. This includes not only physical improvements but also ways to enhance quality of life, such as providing enjoyable open space, sponsoring community events, and creating an intellectual framework through offering courses and training to promote competitive business practices.

Third, the entrepreneurial strategy focused on creating connections between Littleton's business community and outside organizations, including trade associations, R&D firms, think tanks, and academic institutions such as the University of Colorado and Denver University.

Littleton's Department of Business and Industry Affairs, which created the economic gardening concept, annually assists 200 to 300 businesses with the competitive intelligence aspect of its program (Gibbons, 2005; Hamilton-Pennell, 2004). In the 14 years prior to Littleton's adoption of economic gardening in 1989, business recruitment strategies attracted a total of 4,000 jobs to the city. From 1989 to 2004, employment grew from 15,000 to 29,000, for a total increase of 14,000 jobs. During this period, *no* money was spent on attracting outside industries (Hamilton-Pennell, 2004). Thus, the number of employees grew by 93%; however, Littleton's population increased by only 30% from 1989 to 2004. Using business retention strategies, an annual average of 278 jobs was created. With economic gardening, employment grew by an annual average of 1,000 jobs. There are now more than 2,000 companies located in Littleton, the majority of which are small businesses.

One-Stop Business Assistance Centers

One-stop business centers are relatively common components of local government today. In many cases, the one-stop center has a small business mediation function located in the office of the mayor, the city manager, or economic development.

The traditional role for a one-stop center is an information center designed to serve as a key contact point between businesses of all kinds and local government. To be a one-stop advice service for businesses, the center must contain information on all planning and development matters of interest and concern to businesses—local economic indicators and labor market statistics, local development plans, land availability, building regulations and permits, all aspects of finance, and other useful business information. It must also be able to make this information available promptly. Clearly, the center's size will be a function of the size and complexity of the economic

zone it serves. In large cities and towns, for example, a one-stop center for businesses might employ several people. In neighborhoods or community-level and rural places, in contrast, it might employ one person on a full-time or even a part-time basis.

A one-stop center is a valuable business development tool. It benefits businesses by eliminating frustrating referrals from one department to another and by saving time that would have been spent—perhaps without result—trying to procure information on local regulations on their own. In addition to assisting businesses, a one-stop center provides valuable services to local government. Statistics from the center can be used as the basis for reports that describe the number, nature, and geographical breakdown of all business requests. The center's data can also indicate short-term business trends or identify potential business development problems. Moreover, the establishment of an organized professional approach to information dissemination for enterprises strengthens business confidence as well as local governments or neighborhoods.

Start-Up and Venture Financing Companies and Development Banks

Small firms constitute the vast majority of all business enterprises. The formation of new small businesses has effectively utilized both capital and human resources, resulting in employment growth. However, few financial institutions specialize in meeting the needs of small enterprises.

A small business is usually formed using venture capital from the entrepreneur and his or her relatives and friends. If the business is successful, growth is rapid, and the available funds are quickly consumed in buying equipment and/or stock. At this stage, growing small firms need venture capital, which will both improve their profitability and lower their risk of failure. The small business owner then usually approaches a bank for finance. However, the existing financial system is not equipped to provide adequate venture capital to stimulate the growth of innovative small-size enterprises. Reasons for this shortcoming include constraints on different classes of institutions, an inability of existing financial institutions to evaluate the asset value of highly technical or market-driven innovation, and a general insistence on physical assets as collateral for loans. Banks are primarily lenders to rather than investors in small business. Their emphasis on financial security requires some small firms with an inadequate security or equity base but sound profit expectations either to seek higher-cost sources of finance or to defer or cancel development plans if such alternative sources

are unavailable. Venture capital is available primarily from private investors or stock issues. However, many projects and business start-ups in the retail or community service sectors cannot raise funds via the stock exchange, and there are seldom sufficient active local private investors.

The establishment of a mechanism that allows local people to invest in local businesses is therefore an important business development initiative. This can be done through the formation of a start-up and venture financing company—specifically, a community development finance institution (CDFI). CDFIs are a new class of institution with a variety of roots. Some CDFIs are traditional community development corporations (CDCs) that now, with federal government support, offer venture and equity capital. This business development tool can provide venture capital to selected eligible small firms unable to obtain finances from traditional lending institutions and thereby contribute to local economic and employment development. CDFIs, according to Avis Vidal (1995), are not a substitute for ensuring that conventional finance institutions provide equal access to credit and other services in poor inner-city neighborhoods and rural communities of color—places where that access is now clearly deficient. CDFIs appear to be playing a useful role both in pressing conventional institutions to do this and in demonstrating how to do it (p. 194).

The Northern California Community Loan Fund (NCCLF) is an illustration of this form of investment organization. Headquartered in San Francisco, the NCCLF provides small start-up loans to emerging enterprises in disadvantaged and rural communities. The NCCLF obtains its loan funds from private investors who agree to invest in the fund and forgo the interest return on their funds and from foundations and private corporations interested in socially responsible investments.

Development banks are a larger and more established mechanism to provide capital for low-income and female- and minority-owned enterprises. A development bank is a regular lending institution that devotes its resources to fostering economic development (Parzen and Kieschnick, 1992). A development bank might take the form of a savings and loan, a bank, or a community credit union. There is now an association of 40 institutions forming the National Association of Community Development Loan Funds (now known as Opportunity Finance Network). Massachusetts, New York, and Wisconsin have statewide programs with very similar orientations, and the Ford Foundation's Local Initiatives Support Corporation (LISC) provides loan funds or capital support for community development or community enterprise funds on a regional basis for some CDCs. By providing venture capital, local development groups become shareholders in the companies in which they invest. A community shares with other stockholders in the

success (or failure) of investments; it is therefore vitally concerned with their long-term development. Groups like the NCCLF provide the opportunity for residents within a community to invest in small business and share in its success without the risk of investing in just a single enterprise.

To be successful, a CDFI or other community venture group must invest only in those small businesses, existing or new, that are commercially viable and have the greatest potential. LISCs or similar groups should not invest in businesses that are not commercially viable, even for social reasons. The community investment program must be run by a board of directors made up of commercially aware and experienced businesspeople with relevant business expertise.

In sum, community-based (CDFI) groups should prefer to invest in small businesses that do the following:

- Have an innovation in product, process, or marketing
- Have potential for rapid growth
- Have potential for future sales outside the region
- Can demonstrate sound management skills or, if those are absent, is willing to put them in place
- Are willing, if selected, to establish, with the help of the community, an experienced board of directors to assist in planning the future growth of the business (the composition of this board should complement the skills of the small business owner in financial, marketing, and management)

By using these criteria, a good community venture group can embrace a wide range of innovations or technologies in traditional business areas or in the newer high-tech enterprises. A CDFI, in particular, should seek to support a business, not run it, by holding a share of up to 50%. Moreover, because an investment is worthwhile only if at some stage the investor can get his or her money back, a CDFI must have a method of exit via one of the following:

- Selling its share back to the entrepreneur
- Selling its share to another private investor
- Selling its share through the stock market

Finance—particularly local finance that can stimulate new creative enterprises—is the core of small business development. Therefore, every city or neighborhood that wants to pursue this avenue of business development must be prepared at some level to put its money on the line. Timothy Bates (2000), one of the leading scholars on small business in general and minority small business in particular, warned that we must examine all the euphoria

about small business as a good investment. In fact, he pointed out that few minority small businesses are good investments for anyone, including government. Most successful enterprises of this type that pay back loans and investors are Asian small restaurants and similar services employing captive linguistically challenged populations who work in poor conditions and are paid low wages. Even so, many of these enterprises barely provide a living for their owners. Bates (2000) warned that "students of economic development should take note: Honest reporting of small business loan losses is rare in the world of local economic development institutions. . . . Absent of subsidies, the insistence of government sponsored CDFIs to actively fund high-risk, high-cost loans is a recipe for disaster" (p. 240). Bates is correct in his observations. The concept that small business is the cornerstone of neighborhood recovery in inner-city communities has been somewhat oversold. Bates and others admit that there is room for businesses, both large and small, in the inner city; however, to consider local ownership via small enterprises as the best or only solution is not warranted and is bad advice.

Small Business Development Centers

Despite the importance of small businesses as employers and sources of entrepreneurial drive, research evidence suggests that the failure (as distinct from discontinuance) rate among new and small firms is substantial. Poor management is the most frequently cited reason for this. An obvious and arguably cost-effective means of improving the economic performance of the small business sector is to establish SBDCs.

These centers provide management training, counseling or consulting, and research services to small firms, with training as the dominant activity. An SBDC should support the training function in various ways. The center that provides these activities could effectively achieve five interrelated objectives:

- Encourage a higher rate of new business starts with the potential to succeed.
- Reduce the level of business failures.
- Improve the general financial performance and growth rate of the small-firm sector.
- Raise the potential of small firms to create new jobs and improve employment levels.
- Raise the general level of technological innovation and productivity.

Although small business training, research, or counseling activities may be provided through any of several alternative organizations, the best form

is a specialist institution organized in close association with rather than within appropriate educational institutions (e.g., university business schools, advanced education, and technical colleges).

Another approach is to turn unemployed workers into business owners and operators through a business resource center. The purpose of these centers is to tap the entrepreneurial talents of laid off workers and find niches in the local market in which they might start their own enterprises. Business resource centers are usually started by local service clubs, the chamber of commerce, local employment and training institutes, or even a separate nonprofit development and training company. This type of nonprofit organization is designed to use the skills of the underemployed as a basis for generating new employment using business resource centers. These centers provide the following:

- Practical training in business start-ups
- Low-cost, small premises
- Centralized services, such as photocopying, telephone answering, and accounting
- A big brother or sister for the new business

Microenterprise

In 2006, Muhammad Yunus won the Nobel Peace Prize for pioneering the concept of microenterprise supported by the Grameen Bank. The spread of the microenterprise and associated microlending concept is a rare example of the transference of an economic development tool that originated in the developing world to the developed world. In the United States, in particular, both rural areas and inner cities are adopting this tool.

The basic microenterprise concept is to loan funds to a group of borrowers who plan to go into very small labor-intensive businesses in the same community. Microenterprises are usually operated from the home or on the street. They include such enterprises as homemade jewelry or garments, handmade shoes, or specialty foods for restaurants.

Microenterprise programs usually make very small loans to a group of 5 to 10 borrowers, each borrowing under $1,000. The group is responsible for each member making his or her loan payments on time. There is usually some form of prebusiness training and group building before loans are made to potential entrepreneurs. These programs are now in place in many parts of the country, although it is too early to assess their efforts. The programs include the Micro Industry Credit Rural Organization in Tucson, Arizona, and the Lakota Funds on the Pine Ridge Reservation in Kyle, South Dakota. Microenterprise development is not a panacea for the poor, according to

Lisa Servon (1999). However, she maintains that the locally initiated nature of microenterprise programs makes them particularly responsive to their constituencies. This local orientation has allowed them to stay flexible, boosting training capacity, broadening or narrowing the target population, increasing loan-size ceilings, and so forth.

Women's Enterprises

One of the most underutilized resources in the nation is the entrepreneurial talent of millions of women. In the mid-1980s, a pioneering organization was established in Minneapolis–St. Paul to assist women of low income and on welfare to start their own businesses. The mission of this organization, called WEDCO (Women's Economic Development Corporation) and now known as WomenVenture, was to assist women developing small enterprises through an intensive self-help program.

Women Venture has more than 10 affiliate operations around the country. Each is based on a very similar model. Low- and moderate-income women are put through a 7-week intensive training program. The program focuses on assisting them to identify their talents and interests and on building the self-confidence to start a competitive enterprise. The program is rigorous, with few dropouts. Although not all women start their own business, many complete the training with enough confidence to seek work in challenging and rewarding fields.

Servon (1999) has provided an insightful analysis of women's microenterprises in that they offer a means of changing attitudes more than incomes. At the conclusion of her book of case studies, she remarked, "Perhaps one of the most important things that micro-enterprise programs accomplish is that they help change people's attitudes by creating forward motion, giving them the hope they need to believe they can take charge of their own lives."

Promotion and Tourism Programs

The tourism industry has grown rapidly over recent years. Communities have favored and continue to promote tourism in the belief that it is a significant economic and employment development tool. However, surprisingly little is known about the economic and employment implications of the tourism industry. Empirical economic studies of the tourism industry remain few in number. Such studies have been hampered by a lack of consistent data, particularly at the regional level. Objective studies of tourism that measure the economic impacts indicate that tourism at a national and state level is

not a major industry in terms of its contribution to the gross domestic product or employment.

However, these results obscure the vital fact that tourism is spatially selective. Tourism is not ubiquitously but regionally located. Three types of regions can be recognized with respect to the role of tourism:

Regions lacking tourism significance. These are predominantly rural inland regions with no particular or unique attraction for the public traveling for recreational purposes and towns off the main business travel routes. They include most of the nation's small towns, particularly those in the Midwest and Southwest. However, even a community without observable tourism significance can alter its destiny by offering an unusual opportunity, such as "weekend on the farm," or capitalizing on a specific historical event such as the birthplace of a famous or infamous personality.

Regions of high tourist significance. These are areas with substantial scenic wonders and/or excellent climate. They have national and international appeal without increased promotion. They are generally in or near large metropolitan areas. Among those that come to mind immediately are such places as Yosemite National Park in California; San Francisco, California; or Miami, Florida.

Centers of some tourist interest. These are places that have tourism as a component of some other major economic activity. Southern California's film and television industry provides this form of tourism or recreation opportunity.

Although tourism can be an asset, it does not provide the solution for most of the regional or urban areas currently in a state of low growth or decline and should not be promoted as an economic recovery solution. Indeed, research on regional economics indicates that local demand for goods and services is more important than visitor demand. Even in those instances in which the tourist industry has been a major source of growth or decline, there is some doubt that it has ever reached a level of economic importance equal to that of the local permanent population growth. If this is the case, it follows that local planning authorities might focus more on attracting permanent residents—retirees, business managers, and the like—than on seeking to boost tourism from distant places as a source of economic and employment development. Of course, the need for social and physical infrastructure development to keep pace with the rate of population growth must be borne in mind. In sum, for the majority of American communities, tourism is best seen as one component of an economic development strategy rather than as the entire strategy itself.

To be successful, a tourism program of any kind must be well planned and managed. It must have explicit objectives, such as business development, as well as the active support of all local parties with an interest in and effect upon tourism. It should be planned around specific themes, such as business conventions for the industries identified in the region's industrial development strategy. It should also be targeted toward specific populations, such as nonlocal businesspeople, and be promoted and marketed in the places of residence of these populations.

Research and Development

A dominant feature of today's economies is the knowledge-intensive high-tech enterprise. World market competition requires nations to develop value-added and research-intensive products to remain competitive. As a result, technological developments require an increased knowledge base for industry cultivation. The microcomputer industry, which both receives and supplies information, is a prime example of the use of intelligence as a product. But many other new information and telecommunication-related technologies exert profound influences on traditional production technologies. Indeed, it can be said that all tomorrow's industries will be knowledge intensive or they just will not exist at all.

An economy is emerging based on new environmental industries, biotechnology, and information technology (IT). Since the first edition of this book in 1989, for example, the cellular telephone business has emerged and now dominates telecommunications marketing. Many other start-up industries need a place to begin. They require a community interested in mixing uses, such as housing and retail. Communities that provide the right atmosphere for start-up firms will attract them. If they nurture these firms by providing the right kind of atmosphere, they can become the headquarters for new companies or the centers of revitalization of older ones.

Local communities are well placed to identify their target technology sectors and activities. Moreover, those investments should be directed toward developing infrastructure to suit new firms. Improved links between universities and other research organizations, as well as industrial and business companies, should be encouraged and more joint funds established by companies and universities for common research and new product commercialization.

Inventors need a supporting environment during the crucial period between the conception of a new idea and its development to the point at which it can be taken to the venture capitalist. The lack of a supporting

environment during that critical period can result in many fine ideas never taking off. Incubation centers (also known as "incubators" or "technology development centers") are intended to provide this supporting environment. They provide low-rent workplaces and are usually located adjacent to educational institutions, which provide small inventors with equipment, facilities, and advice on business management and work support from student assistance to put together business plans and approach venture capitalists. Other centers can be found within some technology and business parks.

Technology and business parks, in this context, refer to parks that house commercial activities rather than R&D activities. They usually cover several acres and have the following general features:

- A campus-style physical environment
- A mixture of ownership and management, ranging from government to the private sector
- A frequent association with some form of university- or science-oriented establishment
- Low-density development with high-quality buildings
- Specific criteria for the eligibility of prospective occupants to ensure that all the activities within the park are compatible with each other

The technology and business park development is still a relatively recent strategy, so it is difficult to draw any significant conclusions about its likely success. However, ingredients for success apparently include the following:

- Adherence to a carefully thought-out and very specific development objective, including type of desired activities
- Availability of good management and entrepreneurial skills
- Access to venture capital and the accompanying advice on how to use it
- Involvement of the private sector in planning the development
- Presence of meaningful community support

Other locational elements that appear to be influential include transport access, the availability of skilled labor, an attractive living environment, proximity to appropriate research facilities, and the presence of a suitable major manufacturing enterprise that acts as a catalyst. These findings are derived from a range of empirical studies on technology parks. It is important to note that these studies commonly suggest that the development times for technology and business parks are varied—generally 10 to 20 years.

Enterprise Zones

An enterprise zone is a defined area in which planning controls are kept to a minimum and attractive financial incentives are offered to prospective developers and occupants.

The concept of enterprise zones was introduced in the United Kingdom in the late 1970s based on the Hong Kong record of increased job attraction through reduced regulation. They were designed as a last, desperate measure to be tried only on a small scale in depressed areas where conventional economic and employment development policies and tools had failed to arrest decline. An underlying assumption is that the removal or streamlining of certain statutory and administrative controls will encourage entrepreneurs to create or expand businesses, providing the jobs and taxes that distressed areas so badly need.

To achieve this objective, policymakers need to emphasize labor-intensive industries that match the skill levels of potential workers. This can be achieved by offering strong wage subsidies in addition to tax relief packages and land.

Thirty-seven states have created enterprise zone legislation. Louisiana has 750 enterprise zones, and in Ohio, virtually all of Toledo and Cleveland have been declared enterprise zones under state legislation. Federal legislation provided for between 50 and 100 enterprise zones during the Clinton administration. Although enterprise zones have many advocates, the jury is still out on their real benefits. Recent studies indicate that enterprise zones do generate jobs only because of the concentrated attention of policymakers and not entirely because of the incentives provided by localities or states (Green, 1991; Rubin and Wilder, 1989). However, the few assessments of the latest wave of enterprise zones in Harlem and Detroit indicate renewed retail and commercial activity. In Harlem, Magic Johnson, Old Navy, and Starbucks are now part of the retail base. In Detroit, General Motors is headquartered in the city center, along with two new professional sports parks and a gambling casino—all of which were lured by packages of tax and enterprise zone incentives.

Nevertheless, policymakers need to avoid thinking that tax giveaways are the only or best tool to generate new economic activity. Policymakers also need to be careful about the temptation to view enterprise zones as potential for high-tech parks, ignoring any relation between the employment structures of high-tech firms and the skill levels of the local workforces. Other disadvantages of zones of any kind are that large developers and well-established corporations are likely to be the major beneficiaries.

Such areas also place an unfair burden on existing commercial taxpayers outside the zones.

Incentivizing or Subsidizing Local Economic Development?

> *Many people call subsidies "incentives," but that's not really accurate. An incentive motivates someone to do something they would not have done otherwise. A mountain of evidence suggests that development subsidies are often abused by companies that would have done exactly what they did anyway. "Subsidy" is also a more accurate description of what an aid program does when designed and used well: taxpayers subsidize companies to cover the additional cost of building where they serve a public purpose but could not afford to locate without public assistance. Subsidies of this type have what's called a "but for" clause that companies must meet, proving that but for help from the subsidy, the project would not happen at the site.*
>
> —Good Jobs First, n.d.

As this quote implies, *economic development incentives* is the predominant terminology used when describing public efforts to attract firms to specific state and local economies. However, *subsidy* is the more accurate descriptor for the majority of attraction efforts because it is not standard practice to prove that the firm requires public assistance in order to be able to locate on the site. Further, what cannot be proved until after the firm chooses its location is whether the subsidy actually did influence the location or whether it was provided because it was designated as an entitlement that all relocating or expanding firms receive. Concern about the potentially unnecessary use or overuse of subsidies has long been raised, accompanied by increasing calls for transparency and accountability for their use. A major advancement on this front occurred in the United States in the second half of 2015 and will be discussed subsequently.

Subsidies provided to firms can take the form of direct or indirect expenditures, and they come in many forms. Examples of direct expenditures can be purchasing land or making infrastructure improvements for the specific benefit of the firm. Indirect expenditures are typically tax expenditures—that is, tax revenue the government does not collect from the firm. A description of the key categories of subsidies is provided in Table 9.2.

Table 9.2 Types of State and Local Benefits

Direct Subsidies

- *Grant/low-cost loan*. Money award or loan when meeting job performance or other goals. May be "forgivable" if certain goals are met.
- *Training reimbursement*. Programs that pay for or reimburse companies for the cost of training new or existing employees.
- *Cost reimbursement*. Programs, usually involving film production, that reimburse companies for specific expenditures (other than worker training) in the state.
- *Infrastructure assistance*. Programs that cover costs such as installation of utilities or building of private roads at a company facility.
- *Industrial revenue bond*. Low-cost financing based on tax-exempt bonds.
- *Tax credit/rebate and grant*. Programs that combine tax credits or rebates with grants.
- *Tax credit/rebate; property tax abatement*. Programs that combine income or sales tax credits or rebates with property tax abatements.

Indirect Subsidies

- *Tax credit/rebate*. Corporate income tax credits, sales tax exemptions, and other programs reducing or rebating a firm's tax obligation.
- *Property tax abatement*. Reduction of real property (land, structures, rights, and interests) or business personal property taxes.
- *Enterprise zone or Empowerment Zone (EZ)*. For investment or location in specific geographic areas, bundled state and/or local tax breaks and other subsidies.
- *Tax increment financing (TIF)*. The firm receives various subsidies paid by government-issued bond revenue that, in turn, is repaid by the increment of property taxes attributable to the higher assessed value brought about by redevelopment.

Restrictions on Subsidies

- *Clawbacks*. The firm agrees to reimburse subsidies received if it fails to deliver in a specified time period the guaranteed benefits such as number of jobs, level of wages, or sales tax revenue.
- *Performance-based subsidies*. The firm receives incentive only if certain conditions (e.g., number of jobs) are met; thus, subsidy is provided after the company locates.
- *Community benefits agreements (CBAs)*. Legally enforceable contracts between developer or firm and the community in which it is locating. The agreement identifies specific benefits or amenities, as well as mitigations to the community, from hosting the new economic activity. Examples of mitigations are actions to address increased traffic congestion, noise, and pollution. Of the many examples of benefits, establishing local hiring goals, job training, and living wages, as well as contracting with local small, minority, or women-owned businesses appear to be the most prevalent.

In the United States, it has been estimated that state and local incentives to businesses cost taxpayers over $70 billion each year (Dolan, 2015). Opportunity costs can be incurred when subsidies (either direct or indirect expenditures) are provided to firms. For example, when a firm is offered a reduction in property taxes as an enticement to locate, this can lower the amount of funds a local school system receives since property taxes are the primary funding source for schools (at least in the United States).

A recent analysis of 4,200 economic development incentive awards made in 14 states found 70% of the incentive packages and 90% of incentive dollars went to large companies. These were defined based on meeting one of three criteria: having more than 100 employees, not being independently and locally owned, or having 10 or more establishments. The study authors recommend excluding large recipients from receiving incentives and instead investing in what small and large businesses alike could benefit from: job training, education, and transportation. Further, small businesses would benefit most from having better access to capital and higher paid local jobs that increase consumer purchasing power (LeRoy et al., 2015):

> Governors and state legislators routinely praise small businesses for their contributions to economic growth and job creation, but states actually give big businesses the dominant share of their economic development incentive awards.

The quote just given is from the founder of Good Jobs First, Greg LeRoy. Good Jobs First is a national policy resource center focused on accountability in economic development. Its work in tracking subsidies has been nationally and internationally recognized.

In Table 9.2, the third category, "Restrictions on Subsidies," summarizes efforts to ensure that communities and local businesses are protected when subsidies to firms do not provide the expected economic development benefits.

U.S. Versus International Perspectives

In the United States, incentives are provided by state and local governments and development authorities. States and localities make the choice to participate in the business of providing incentives, but if they decide they don't want to engage in a bidding war with another location, then they risk losing out on a new firm that could have substantial economic benefit.

Such bidding wars are frequent. They are typically managed by site consultants under contractual obligation not to reveal the industry client

they are assisting in finding a new location. As a consequence, states and localities frequently don't know the actual firm they are trying to attract, who their competitors are, nor what level of incentives they must out-compete.

Further, obscuring the subsidization of firm location is the state and locality practice of maintaining secrecy during—and even after—the negotiation process for incentives to the prospective firm. This may be an actual requirement of the firm evaluating the location. But other factors may motivate this secrecy, such as to reduce the possibility landowners might seek higher-than-market rates for properties needed for land assembly to accommodate a potential firm's site needs. Even when the negotiations are concluded, the amounts of subsidies that were offered or implemented if the negotiated deal was successful may not be revealed or tracked to determine if they met the conditions of the deal.

The practice of secrecy and failure to monitor outcomes is going to change significantly as a result of the recent action of the Governmental Accounting Standards Board (GASB; 2015). The GASB has issued a formal statement (Statement 77) that establishes financial reporting standards for tax abatements offered by state and local agreements. From the definition that follows, it can be seen that economic development incentives and subsidies are what the GASB (2015) labels as tax abatements:

> A reduction in tax revenues that results from an agreement between one or more governments and an individual or entity in which (a) one or more governments promise to forgo tax revenues to which they are otherwise entitled and (b) the individual or entity promises to take a specific action after the agreement has been entered into that contributes to economic development or otherwise benefits the governments or the citizens of those governments. (p. 2)

To meet the GASB (2015) new standards, state and local governments will be required to disclose the following:

- Brief descriptive information, such as the tax being abated, the authority under which tax abatements are provided, eligibility criteria, the mechanism by which taxes are abated, provisions for recapturing abated taxes, and the types of commitments made by tax abatement recipients.
- The gross dollar amount of taxes abated during the period.
- Commitments made by a government, other than to abate taxes, as part of a tax abatement agreement. (p. 3)

Good Jobs First sees Statement 77 as "a breakthrough against inequality" because it will allow the public to assess whether providing subsidies to the corporate sector results in under-funding essential public services such as K–12 education, transit, critical infrastructure, and fire and police protection. Ellen Harpel, president of the firm Smart Incentives, has observed that elected officials and community groups are demanding better data on incentive use from their economic development organizations. She has advocated that "incentives should be used to accomplish community goals—not just to win a deal" (Harpel, 2015).

The European Union and Australia offer two examples where government seeks to prevent what is called "poaching" of firms between localities offering subsidies. To dampen subnational competition, the European Commission has a strong centralized control system, while Australia developed a voluntary agreement in 2003 among subnational governments of five Australian states not to poach firms from each other (Markusen & Nesse, 2007).

In the EU, subsidies are not to be used by member states unless they contribute to the goals of the EU as a whole. The European Commission requires advanced notification of all planned subsidy agreements.

> Poorer areas of the EU can provide larger subsidies than richer ones, and the most prosperous regions are prohibited from giving any aid at all. Governments can thus only give support to firms in proportion to the disadvantage of the region. (Dadash, 2013)

Australia's sixth and fastest growing state, Queensland, refused to be part of the agreement when it was initiated and subsequently renewed in 2006. The agreement did not actually control the use of tax cuts and other incentives; it simply prevented multinational recruitment competition among cooperating states. Further, it supported transparency and accounting principles by states agreeing to provide annual reports. The agreement ended in 2011 after New South Wales and Victoria refused to renew the deal, making it unfeasible for the remaining states (Dunckley, 2011).

Two case studies of subsidy use are provided in this chapter. In Economic Developments 9.1, a case study of how the city of San Francisco provided subsidies to Twitter and other high-tech firms in exchange for community benefits is described. In Economic Developments 9.2, an example of how the European Union enforced its policies on improper provision of subsidies to the U.S. multinational corporation (MNC) Starbucks is profiled. The case illuminates how an MNC can manipulate its supply chain to maximize tax and subsidy benefits.

ECONOMIC DEVELOPMENTS 9.1
#Subsidizing Twitter*

We have about 350 employees. And based on our current growth trajectory, we can't stay on the two floors that we currently have. So, at some point we're going to have to look at other options.

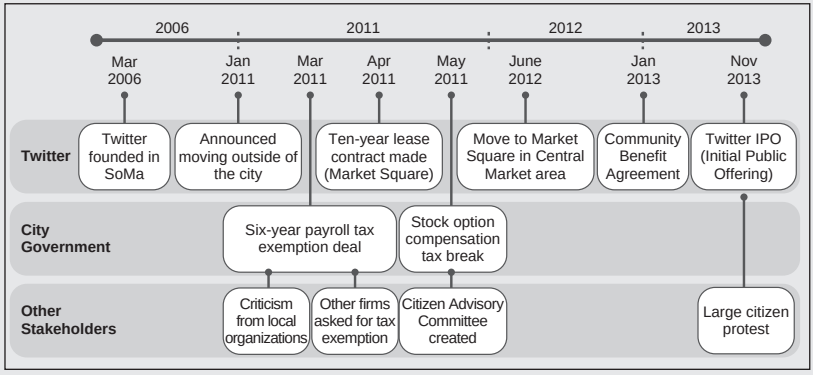
—Carolyn Penner, representative of Twitter, January 13, 2011

Twitter Inc. is a technology company that provides an international social network service. It began in San Francisco in 2006, and quickly grew into a social media giant with 302 million active users and 3,900 employees. Its estimated revenue was $1.4 billion in 2014.

The subsidy deal (see Figure 9.1) between Twitter and the city of San Francisco was initiated soon after the company's January 2011 announcement that it planned to leave the city. An agreement on a subsidy deal was reached only 2 months after Twitter's announcement. The incentive package provided a payroll tax exemption and additional public services. The package was granted under the condition that Twitter move to the city's economically distressed downtown neighborhood of Central Market. Subsidies given to the company were originally estimated to be $22 million, the largest provided to a company within California between 2007 to 2011 (Story, 2012).

Success in retaining Twitter, as well as other technology firms who subsequently became eligible to take advantage of the payroll tax exemption, is estimated to have contributed at most 5% of new city jobs between 2010 and 2013 (City and County of San Francisco, 2014a). Subsidizing the retention created strong concerns about gentrification around Twitter's relocation site and provoked protests by city residents against housing displacements, increased living costs, and the unfairness of subsidization.

Figure 9.1 Timeline of Subsidy Deal



Source: Figure created by Heon Yeong Lee

The deal between Twitter and San Francisco was made amidst high unemployment rates and stagnation of the city's real estate market due to lingering effects of the Great Recession. In response to a $483 million annual budget deficit, the city had also made cuts in its payroll and public services. San Francisco's unemployment rate was 9.2% in 2010, but the city proved resilient, as indicated by a 6-point drop in unemployment to 3.2% by 2015 (U.S. Bureau of Labor Statistics [BLS], 2016).

The creative and knowledge industries played a significant role in the city's economic recovery. These industries were stable during the recession and had stronger employment growth than any other industry (City and County of San Francisco, 2014b). Information technology (IT) accounted for 21,000 or 31% of jobs created in San Francisco between 2010 and 2013 (Mandel, 2014). Seeking to internalize the benefits of this growing sector, city government implemented new policy initiatives (e.g., summer internships, public school–tech firm partnerships) under the leadership of the tech-friendly city mayor, Ed Lee.

Regional Competition

There is strong competition for high-tech firms in the Northern California region (Avalos and Delevett, 2013). San Francisco's success over the region's traditional high-tech industry hubs has been attributed to its abundant urban amenities and closer relationships to the IT market (Vekshin, 2014). Because social media and mobile app companies seek proximity to clients, competitors, and their venture capital providers, they tend to prefer San Francisco over traditional industry hubs and have significantly increased the demand for premium office space. Even large firms, who build campus-style office complexes in traditional locations due to greater land availability, have been opening branch offices in the San Francisco Bay Area to take advantage of the urban environment and broaden their appeal to young tech employees.

Payroll Tax System

San Francisco has had an unusual corporate tax structure called the payroll tax system that levies taxes on employers based on employee compensation.** Currently, San Francisco's payroll tax is 1.5% of total payroll expenses; these include salaries as well as other compensation such as commissions, stock-based compensation, and property issued in exchange for the performance of service. San Francisco's payroll tax system was implemented in 1970. Typically, the rationale for a municipal payroll tax was to ensure that workers who commute into a city—and the businesses that employ them—pay their fair share of the public services provided by the city. However, the payroll tax has been criticized as an impediment to economic growth because it is seen to discourage new firms from locating as well as existing firms from expanding employment. It is particularly problematic for technology start-ups. These start-up companies frequently develop new

(Continued)

(Continued)

business ideas and innovative technologies before they have concrete monetization plans. They also need to hire staff before they begin to make a profit, and the payroll tax makes it harder for the start-up company to show a profit and be attractive to investors (Steinmetz, 2014). The payroll tax can also discourage growing technology firms' location in the city because their successes in creating initial public offerings (IPOs) would incur large amounts of payroll tax from the stock options given to motivate and retain staff.

Downtown Neighborhood Revitalization

Rather than give tax credits to just one firm, which could be viewed as discriminatory, San Francisco designated a new tax exemption district around the Central Market and Tenderloin neighborhoods—San Francisco's economically distressed downtown area. Central Market was once a commercial center of the city, but its significance declined in the late 1960s and early 1970s.

Before Twitter's relocation, the city government was attempting to revitalize the area by establishing public–private partnerships, giving low-interest loans to local small businesses, and supporting local arts groups. However, success was limited. For example, the storefront vacancy rate was recorded at 31% in 2010, and it was expected to worsen because major tenants, including Bank of America's data center, planned to leave this area. Retail services for neighborhood residents and workers were lacking, and street crime, panhandling, and lack of foot traffic discouraged revitalization efforts (Committee of Supervisors, 2011).

The Subsidy Deal

The initial proposal included an ordinance for a new payroll tax exemption for 6 years and was submitted to Twitter in early February 2011. According to the ordinance, a business moving into or already located in the Central Market and Tenderloin areas is eligible to be exempt from payroll expense tax on additional employees for a maximum of 6 years. Twitter would still pay the payroll expense tax for its existing 350 employees. In addition to the payroll tax exemption, the Office of Economic and Workforce Development promised to give Twitter additional city services to address concerns about relocating to an economically distressed area, including extended foot patrol and additional express public transportation services.

Economic Outcomes

The result of an initial fiscal impact analysis of the new legislation reported a total of $22,032,000 dollars would be transferred to Twitter under the conditions that Twitter hired an additional 2,650 employees and paid a $102,000 average annual salary until 2013. The city also expected to spend $162,000 for initial one-time administrative work and $186,000 for annual audits. The cost for additional city services, such as extending policy patrol and additional public transportation

services, were not included in the initial analysis (Committee of Supervisors, 2011). Based on the fiscal analysis, the city would forgo 12.7% of Twitter's 6 years' tax responsibility.

Due to the pressure from existing high-tech businesses, the city legislated another tax break ordinance in May 2011, which gave a tax exemption for stock option compensation.

After the relocation of Twitter headquarters, 17 other technology companies, including Zendesk, Spotify, One Kings Lane, and Yammer, also moved into the revitalizing area mainly because of the tax exemption benefits. However, other companies, like Uber, Dolby, and Square that moved near Twitter headquarters did not take any tax breaks. The number of new jobs created by these technology companies has been estimated as between 6,000 to 10,000, according to LinkedIn, a business-oriented social networking service provider.

As a result of new firm location, total payroll tax collected in the Central Market and Tenderloin areas increased 648% from 2010 to 2013, a significantly higher rate than the city's overall average (City and County of San Francisco, 2014a). Neighborhood-serving retail businesses, however, did not appear to benefit strongly from the new jobs created, experiencing only a 10% growth in taxable sales compared to 25% for the city overall (City and County of San Francisco, 2014a).

The clustering of the tech industry in San Francisco also brought about an influx of high-tech supporting service sectors. Venture capitalists, who traditionally concentrate in Silicon Valley, moved to San Francisco to be closer to new start-ups and entrepreneurs. Of the $26.8 billion venture capitalists invested in California companies in 2014, 41% was invested in San Francisco–based companies (Somerville, 2015).

Gentrification

The Central Market area added new high-rise luxury residential buildings to house the influx of high-income knowledge workers. A number of older buildings with long-deferred maintenance, and that provided low-income housing, have been renovated into either luxury residential buildings or office spaces. Check cashing shops and shuttered storefronts are now replaced by upscale businesses such as cafes that sell $65 beers (Steinmetz, 2014).

Those displaced have found it impossible to attain affordable housing locations inside the city, due to the high cost of renting and home ownership. The median housing price was $813,000 in 2014 (Levy and Levy, 2014). Further, nonprofit organizations previously serving the local community are being pushed out by rising rents (Bowe, 2013).

Public pressure has led to the development of more community benefits agreements (CBAs). In the Central Market area, six companies, including Twitter, signed new CBAs with the Citizens Advisory Committee.

(Continued)

(Continued)

Case Study Insights

Compared to conventional subsidization cases, the subsidy deal the city of San Francisco provided to Twitter has three distinguishing characteristics. First, the incentive package was provided to the headquarters of a relatively new and fast growing technology company, rather than for an existing industry. Second, the package was provided to retain a locally incubated company, rather than to attract external investment. And third, the incentive package was distinguished by its requirement for the company to relocate to a downtown, high-poverty neighborhood.

It's been estimated that each new high-tech job in a metropolitan area creates five additional local jobs in other industries (Moretti, 2012). Thus, inducing high-tech industries into economically distressed areas can create significant growth. From a place-based perspective, San Francisco's subsidization deal for Twitter and other IT firms could be deemed a great success.

At the same time, subsidizing high-tech industry can create significant gentrification effects. High-paid tech workers drive local real estate booms and introduce consumption patterns supporting new upscale retailers, cultural services, and goods. In a study of the 50 largest metropolitan areas, San Francisco had the second highest inequality (Berube, 2014).

The growth induced by the subsidized high-tech firms pushed out existing low-income residents and replaced them with high-income knowledge workers. Existing retail services and nonprofit organizations that previously served low-income residents were priced out of the area. Low-income residents did benefit from new job growth, but the low-skilled and low-income jobs to which they had access could not provide them with wages high enough to continue living in the area. Thus, from a people-based perspective, the outcomes of the Twitter subsidization deal are mixed and cannot be seen to advance the principles of sustainable local economic development (SLED).

** Between 2014 and 2018, a phased replacement of the payroll tax with the gross receipts tax is occurring. See http://sfgov.org/sf/sfbiztax.

ECONOMIC DEVELOPMENTS 9.2
Roasted by Regulation: Starbucks Coffee's Selective Tax Advantages in the Netherlands*

The European Union has established specific policies to regulate tax incentives offered by member states to reduce unfair competition within the EU region. These polices provide a level playing field among states—more so than most other countries around the world without regulatory policies in place. According to both the 2007 Treaty on the Functioning of the European Union (TFEU) and the more recent "Guidelines on Regional State Aid for 2014–2020," EU countries are not allowed to produce legislation that artificially lowers taxes paid by companies, as this would give certain countries an unfair competitive advantage over other member states. Further, the Organisation for Economic Co-operation and Development (OECD), made up of members from the European Commission and other countries including the United States, updated transfer pricing guidelines in 2010 to prevent intrafirm monetary transfers among subsidiaries that might produce unfair advantages within corporations. Transfers must follow an "arm's length principle" so that taxable revenue should not be less than what it would have been under traditional tax legislation. Based on these guidelines, the European Commission monitors and regulates both incentives offered by member states and the tax structure of multinational companies locating in those states (European Commission, 2013). The case below on Starbucks demonstrates how these mechanisms are applied.

Headquartered in Seattle, Washington, the multinational Starbucks Corporation roasts, markets, and sells specialty coffee around the world and currently operates in 70 countries. There are more than 12,000 stores in the United States, approximately 1,900 in Europe, the Middle East, and Africa (EMEA), and around 3,300 in the China/Asia Pacific (CAP) region. In 2013, Starbucks Corporation earned $14.9 billion in gross profit, or $8 billion in posttax net profit (NASDAQ, n.d.). Of that revenue, 74% was in the Americas, 8% in the EMEA region (mostly in Europe), and 6% in the CAP region.

This case illustrates the complex structure of Starbucks' multinational corporation (MNC) that appears to have evolved in response to incentive opportunities. Both Starbucks Coffee BV and Starbucks Manufacturing BV are subsidiaries of Starbucks Corporation and located in the Netherlands. *BV* stands for the Dutch phrase meaning *private limited liability company*. The former, Starbucks Coffee BV, is the headquarters of the EMEA region and houses its intellectual property (IP) rights for coffee bean roasting recipes in the British-based Starbucks entity, Alki Limited Partnership (LP; European Commission, 2014).

According to Starbucks' corporate guidelines, Starbucks Manufacturing BV must pay Alki LP a royalty for IP rights to produce and deliver coffee around the EMEA region. Starbucks Manufacturing BV roasts, distributes, and sells coffee and food to

(Continued)

(Continued)

Starbucks outlets throughout the EMEA region. It receives its raw green coffee bean supply from the Starbucks Swiss subsidiary, Starbucks Coffee Trading Company SARL, the French phrase for *limited liability company* (European Commission, 2015).

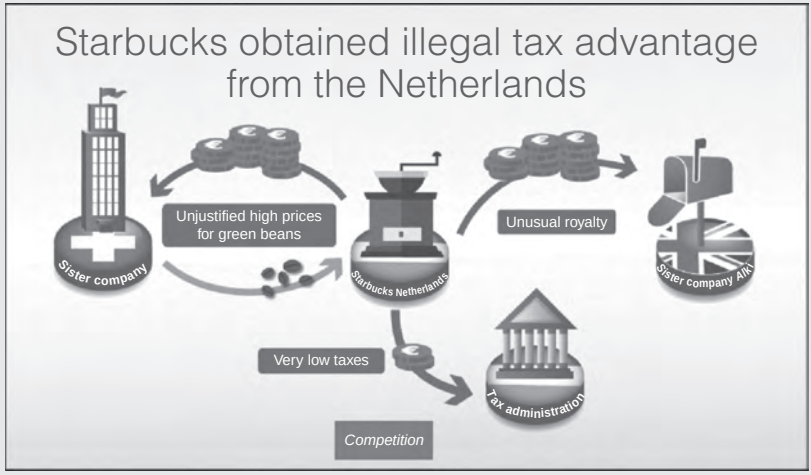
In June 2014, the European Commission began investigating allegations that Dutch tax authorities and Starbucks Corporation negotiated an advanced pricing arrangement (APA) for Starbucks Manufacturing BV, starting in 2001, which violated the OECD "arm's length principle" and TFEU guidelines. Investigators found that Dutch authorities formed special tax rulings allowing Starbucks Corporation the flexibility to create tax avoidance strategies that shifted taxable revenue outside of the Netherlands and decreased the company's overall tax burden (European Commission, 2014).

First, Starbucks tax advisers artificially marked up the price by 20% for the raw green coffee beans purchased from Swiss subsidiary Starbucks Coffee Trading Company SARL. Tax advisers justified this adjustment by considering Starbucks Manufacturing BV to be only a "contract manufacturer," an intermediary in the production process. The company paid a higher premium for the raw green coffee beans to the Swiss company to account for their absorbing more risk from sourcing the beans. However, investigators found that the Swiss subsidiary does not physically handle the beans and that Starbucks Manufacturing BV is completely responsible for the roasting and manufacturing of the coffee beans. The cost markup for raw materials does not take into account Starbucks Manufacturing BV's actual risks of the raw material inventory and therefore artificially raises the payment to the Swiss subsidiary (European Commission, 2014).

Second, royalties paid to Alki LP are based on coffee roasting recipe instructions, a concept of IP scrutinized by the European Commission. Further, the royalties do not align with the economic value of the IP rights based on Starbucks Manufacturing BV's annual sales. Instead, royalty payments fluctuate annually based on the profits of the subsidiary and increased from 1 million euros in 2010 to 12 million euros in 2011. If coffee and service material sales increased within the Netherlands, tax authorities adjusted royalty payments to Alki LP to transfer outside of the country the extra revenue gained. According to Dutch tax code, revenue transferred to Alki LP was not considered direct payment to the Starbucks Corporation in the United States and, therefore, not liable to Dutch corporate income tax. The European Commission's investigations also found little information about Alki LP itself, which seemingly had no registered employees or recorded financial statements. It was absorbed into another Starbucks subsidiary shortly after investigations began (Alderman, 2015; European Commission, 2014).

In October 2015, based on OECD and TFEU guidelines, the European Commission ruled that Dutch authorities indeed granted economically unjustifiable and selective tax advantages to Starbucks Manufacturing BV that shifted a large part of its revenue abroad and significantly lowered taxable profits. This decision requires the Netherlands to recover the €20 to €30 million in unpaid tax revenue from Starbucks Manufacturing (European Commission, 2015).**

Figure 9.2 Starbucks Tax Avoidance Strategy



Source: © European Union, 1995–2015.

The ruling occurred in parallel with other European Commission investigations of MNC tax avoidance schemes such as Apple Inc. in Ireland and Fiat Chrysler in Luxembourg. The investigations address the growing concern over countries providing tax loopholes for multinational companies and unfairly increasing their competitive advantage over regions in the European Union with high unemployment and sluggish growth.

Since the European Commission regulates EU state behavior rather than that of MNCs, all of these cases directly target the incentive-friendly tax rulings of the countries themselves and not the strategies of the global firms. Antitrust Chief Commissioner Margrethe Vestager stated the following in reference to the Starbucks ruling:

> Tax rulings that artificially reduce a company's tax burden are not in line with EU state aid rules. They are illegal. I hope that, with today's decisions, this message will be heard by Member State governments and companies alike. All companies, big or small, multinational or not, should pay their fair share of tax. (European Commission, 2015)

While work is left to be done, the EU stringent regulations on tax exemptions and subsidies provide more mechanisms than most incentive policies around the world to reduce unjust competitive advantage and promote a more level playing field among member states.

*Research assistance for this case study provided by Ashley Bozarth.

** Starbucks Corporation will be appealing the case, arguing that it has followed all tax laws and international guidelines.

Conclusion

Business is the engine of economic development. All business originates from a sense of opportunity to serve or gain. Irrespective of the motivation to start a business or maintain it, this motivation can be hampered or retarded by the actions of communities or local governments. No business wants to be where it is not wanted. However, communities need to consider carefully the types of businesses they want to host. Linking economic and employment objectives to the types of firms in the locality is an essential task for the community. (See Table 9.3 for a sampling of business development project starters.)

Table 9.3 Business Development Project Starters

Tool	Project Idea Starter
Attraction	*Organization development:* A local development commission with state finance backing loans funds to a nonlocal dying industry suited to the region to assist that industry to relocate and develop as a business development venture and possibly also as a tourist attraction (e.g., a local development commission's sponsoring surfboard-making industry). *Work space and support facilities for small business:* This aims to establish a privately or publicly owned project using a workhouse building or the like to provide work space and a support framework for small firms with common facilities (e.g., reception, telephones, Internet, copiers, cleaning, maintenance, conference rooms).
Small business and new venture start-ups	*Community business advice project:* This is an organization formed to provide professional advice and assistance to small businesses in the areas of management, marketing, accounting, financing, locating resources, and problem solving. One such organization is a nonprofit organization run by a committee that decides which clients to help and how much to charge them (e.g., no charge for low-income groups and marginal businesses and standard consultant fee to established firms). It employs a full-time business adviser who works directly with clients in their home or places of business.
Business expansion/ retention	*Export promotion scheme:* This is a scheme to assist small- and medium-sized firms in exploring new export markets by representing them at trade fairs and missions. *Regional technology center:* This is a center to research and identify technologies appropriate to the region's socioeconomic base and to help people who are developing these techniques start up a business. It provides the necessary backup support facilities and management advice.

Tool	Project Idea Starter
Local government	*Joint public–private ventures:* Joint venture agreements for construction of business venture facilities to revitalize the central business district, generate employment, and create revenue for the city government. These facilities could include a cinema complex or an administrative center with shops, parking garage, and sports facilities.

Businesses, and particularly small, new, innovative businesses, may become the large firms of the future. It was not that long ago that Microsoft was a small firm, but now it is a giant subject to antitrust action. Microsoft is a significant component of Seattle's economy. Bill Gates could have gone elsewhere. On the other hand, around three out of every five small businesses started will fail. Further, even if a small firm has an excellent business plan, if it is poorly capitalized, its survival chances will be very low.

The means communities use to grow, attract, and retain firms will depend on what resources are available. The most important factor in firm location is knowing the area's assets as well as having the correct attitudes and infrastructure to support the firm. Every community must develop special activities and tools to build the right type of infrastructure for the development and the employment it wants. Chasing tourists or high-tech firms should not top the agenda unless the community is particularly well situated for this form of economic development. The most important activity is building soft infrastructure, such as information and finance, to make the community attractive and supportive to enterprise. In essence, the community must become entrepreneurial in the use of its resources if it wants to grow, attract, and retain firms as a major component of its economic development strategy. See Economic Developments 9.3 through 9.5.

ECONOMIC DEVELOPMENTS 9.3
TARGETing Retail Gaps in a Low- to Moderate-Income City*

The city of Azusa is one of eight San Gabriel Valley foothill communities of Los Angeles County, California. It has 45,000 residents and 13,000 households, most of whom are Hispanic. Fewer than 20% of Azusa's residents over 24 years of age have earned college degrees (the state average is 30%; U.S. Census QuickFacts, Azusa, California, n.d.). Compared to the other seven foothill communities, Azusa has the lowest home ownership rate and median housing sales price (City of Azusa, 2010). Azusa has had difficulty competing with surrounding communities due to declining neighborhoods, falling property values, reinvestment activity, as well as increasing crime and rental property turnover. This was particularly the case for its retail economy, in which sales per capita in Azusa lagged behind those of the Los Angeles region by more than $2,000.

A 2006 study found Azusa's leakage of retail sales amounted to nearly $20 million (Klingensmith and Strother, 2006). The study calculated the market serving index (MSI) for each retail category. The MSI is a form of location quotient in which the proportion of firms for Azusa in a specific retail category is compared to the proportion for the larger retail market of which it is a part, in this case, the Los Angeles metropolitan area. Several retail categories for Azusa had MSIs of zero—that is, there were no retailers within the city limits. Among these categories were nursery and garden centers; men's clothing stores; hobby, toy, and game stores; book, periodical, and music stores; office supplies, stationery, and gift stores; and department stores. Other categories in which sales were lower than estimated demand included women's clothing stores, jewelry stores, furnishing stores, and shoe stores. From identification of these retail gaps, Azusa concluded its retail economy could best be strengthened by attracting a large value retailer such as Target (see Figure 9.3). While Target normally looks for a more urban and upscale market than that found in Azusa, the city approached Target and was able to convince it to open a store due to several factors.

First, countering the weak retail market indicators was the fact that Azusa has two universities, Azusa Pacific University and Citrus College, with a combined student population of more than 20,000. This effectively increases Azusa's consumer base by 50%. Locating near the two college campuses would significantly add to retail sales, since Target carries product lines with particular appeal to the college market.

Second, the regional transit system called the Metro Gold Line planned to add two Azusa stops. The city proposed to locate Target at one of these stops developed as a transit-oriented development close to the colleges. Because the Gold Line would connect Azusa with neighboring cities, including Pasadena and Los Angeles, Target would help fill a gap in Azusa's retail needs as well as draw in new consumers from outside communities upon completion of the light rail extension (Klingensmith and Strother, 2006).

Figure 9.3 Target Azusa

Source: Photo by Austin Gordon, senior economics major, Azusa Pacific University; Ken Rhinehart; http://www.iwillride.org/?p=917.

Third, the city assembled the land for the store using its redevelopment authority and sold it to Target at less than cost. It also paid for the streetscaping of the site.

Several issues about the project arose during the planning phase, including the desire to preserve trees near the site; concern about nighttime lighting and visual cohesiveness with the surrounding area; the need to prevent theft of shopping carts; air quality and noise impact of delivery trucks, along with the relationship of delivery entry points in relation to the planned Metro line; and traffic flows and parking needs (City of Azusa, 2011).

Target submitted plans and technical specifications for the building in April 2009. The plans addressed many of the issues raised. The property's exterior was built to blend in with the Spanish architecture of nearby city hall and the greater community. The building itself is identified as a "unique" Target due to its alternative layout and appearance from the traditional big box, single-level store models. Because the site's footprint is limited to a single city block, designers had to be creative in maximizing its utility. The store has two floors, with the shopping level located above a ground-level garage with more than 400 parking spaces (Gresham, 2010).

Target opened ahead of schedule in 2010. In addition to its usual product line, the site contains a pharmacy, a fresh grocery, an alcohol selection, a Pizza Hut, and a Starbucks. Councilman Uriel Macias declared the successful recruitment of Target a "crowning achievement" in Azusa's rebirth (Tedford, 2010). Pointing to the

(Continued)

(Continued)
city's effort to use the store as a cornerstone for future economic development and additional foot traffic, he said, "Our downtown has completely changed from what it used to be. It used to be something you would drive by. Now it is a destination point" (Tedford, 2010).

Economic and Community Development Director Kurt Christiansen (2012) believes Target provides a win-win for the city: Not only is it a convenient one-stop shop for residents with limited transit options, but it also provides additional tax revenue as well as revenue from increased municipal electricity and water sales. Another benefit worth noting is that Target invests 5% of its income from the Azusa store in grants to local schools, the library, nonprofits, and supporting city sponsored events. The store has also provided much-needed jobs to the city; Target hired 225 employees, making it the city's ninth largest employer. All in all, the project has helped to address Azusa's retail leakage, provided jobs for the local economy, and assisted in the commercial revitalization of Azusa's downtown.

ECONOMIC DEVELOPMENTS 9.4
Mobile Entrepreneurs: Portland Food Carts*

"Street food" is an urban industry that has thrived because of rather than in spite of the Great Recession. Benefitting from lower overhead costs and greater flexibility than that of a restaurant, food carts have been an emerging sector in cities across the country. With hundreds of food carts and strong city policy support, Portland, Oregon is a leader in this mobile entrepreneurship movement that creates jobs, public revenues from business licenses and sales taxes, and demand for supplies often locally provided. Many food truck operators hope ultimately to open up brick-and-mortar businesses when they accumulate the necessary start-up capital.

In Portland, many of the food carts operate in "pods" of several carts clustered together in open spaces, especially along the edges of surface lots and vacant parcels. As of December 2010, Portland was home to 25 of these pods, one of which had 30 carts. Planners have welcomed this arrangement as a way to activate public space. Food carts generate pedestrian activity and encourage interaction among customers in common outdoor spaces. Like other forms of street vending, food carts provide a viable temporary use of land that that may ultimately have more permanent development when economic conditions are more favorable. Food carts can also contribute to urban safety by providing another set of eyes on the street, as illustrated by the New York City street vendor whose presence is credited with thwarting the attempted 2010 car bombing of Times Square.

While many of Portland's carts operate in parking lots or on temporarily vacant land, some developers have begun incorporating space for permanent pods in private developments. The first and perhaps most well known example is Roger Goldingay's Mississippi Marketplace. Goldingay's parcel of land had been slated for condo development prior to the recession. Goldingay built a market center instead and included a 10,000-square-foot lot specifically designed to accommodate 10 food carts, covered seating, electrical outlets, and recycling bins.

A study of Portland street food found that food carts benefitted local economic development because they fostered entrepreneurship and microenterprise, street vitality, and social interaction among consumers. Commissioned by the Portland Bureau of Planning and Sustainability and conducted by graduate urban planning students at Portland State University, the study found Portland's food carts provide an important opportunity for immigrants to become entrepreneurs, as roughly half of the street vendors surveyed were born outside the country. Citing the desires to be independent, to eventually open up a restaurant, to be a cook, and to have a flexible schedule, food cart operators were found to enjoy their trade and the relationship they have with customers.

Among the 78 vendors surveyed in the study, 63% agreed that street vending was a good way to earn a living to support themselves and their families. According to the study, start-up costs for a high-end food cart are less than half that of a small brick-and-mortar business with a single employee. While there are lower barriers to entry for food cart entrepreneurs starting a business, finding financial and other assistance to do so still proved to be a challenge for many vendors. Only 18% of vendors surveyed received any job training for their venture. About half of the food cart owners obtained start-up capital from family members and from their own savings. Eight percent utilized a home equity loan, and only 2% received financial assistance from an outside organization. Many never pursued bank financing. This suggests a role for community economic developers if there is a desire to grow the industry.

Another Portland State University study, "Food Carts as Retail Real Estate," assessed the impact of food carts on local economic development (Chastain, 2010). In 2010, 461 licensed food carts paid an average monthly rent of between $300 and $550, accounting for combined yearly rents of between $2 and $3 million dollars. Food cart operators spend between 13% and 14% of their revenues on rent. Much of this rent revenue benefits private property owners, as food carts often occupy private land. The study made rather wide-ranging estimates for job creation—between 500 and 1,800 local jobs—and total sale revenues of between $14 and $23 million.

While some restaurant owners believe the nearby presence of food carts can help business by increasing area foot traffic, others are concerned they have a negative effect on their business. Citing fewer government regulations and lower permit fees and overhead costs, many brick-and-mortar restaurant owners view food

(Continued)

(Continued)

carts as unfair competition, cannibalizing business from restaurants. The Oregon Restaurant and Lodging Association states that carts should be categorized as restaurants and be subject to the same fees. Because food carts are technically mobile vehicles, permit holders do not pay personal property taxes on kitchen equipment like restaurants do. When business is bad in one area, cart owners may be able to relocate to a new area.

On the other hand, food cart business is subject to weather conditions, as 65% of food cart patrons walk to make their purchases from the carts. Further, the food cart customer base is also more vulnerable, as the carts do not have fixed, permanent locations. Finding a location for their business can be a key challenge for food cart operators.

While street food vendors have always operated in various cities across the country that allowed their activity, urban food carts are emerging as a significant new economic development in entrepreneurship. The food carts provide an eclectic range of choices in a retail food economy dominated by chains and brand names. Consequently, they can contribute to locality development and a community's sense of place.

ECONOMIC DEVELOPMENTS 9.5
Small-Town Ideas Spur Big-Time Manufacturing Growth*

Many cities and towns around the country have struggled with shrinking manufacturing bases. In 2009, two Chrysler plants closed in St. Louis, resulting in the loss of thousands of city and regional jobs. Yet 80 miles south, the town of Perryville, Missouri, with a population of just over 8,000, has managed not only to maintain but also to actually grow its manufacturing base. Today, approximately one out of three workers in the town is employed in manufacturing. Perryville's success can be attributed to a series of innovative policies as well as a more than 50-year-old public–private partnership that established the town as a center of business attraction and expansion.

Up to the mid-20th century, Perryville was, like many other small American towns, dependent on a single industry. In this case, it was shoe manufacturing. When its two shoe factories shut their doors in the 1950s and the town lost hundreds of jobs, Perryville's economy lacked the resiliency that comes with industry diversification and quickly began to decline. In response, the Perryville Chamber of Commerce voted to form the Perryville Development Corporation (PDC; n.d.), a move that has been lauded as quite progressive (Sweet, 2012).

This established a public–private partnership where the PDC acted as separate entity to buy and sell land and recruit businesses with the support of the chamber of commerce.

To finance its establishment, the PDC sold 20,000 shares of stock at $10 each. It used this initial funding to purchase 24 acres of land that it sold to the partnership's first investor, Gilster-Mary Lee. A small baked goods company, Gilster-Mary Lee converted one of the old shoe factories into its manufacturing center, aided by investments from the PDC. The PDC remained a coinvestor in Gilster-Mary Lee by buying stock in the company. Gilster-Mary Lee has grown from a start-up business of 25 employees into a company employing 1,600 in the region today. Since the 1950s, the PDC has recruited and invested in a diverse array of companies including Toyoda Gosei Missouri (TGMO), a supplier of high polymer auto parts, Sabreliner, a company specializing in refurbishing old aircrafts, and Solar Press, a commercial printing firm. The PDC became a not-for-profit organization in 1997 and is financed through sales of stock, plus interest income, farm income, and rental income from a speculative building.

Perryville applied other strategic policies to attract and retain manufacturers such as tax increment financing (TIF), tax abatements, and infrastructure development at minimal cost to businesses. Thanks to these supportive strategies, the large and diverse manufacturing base has remained and provided stable, long-term jobs to residents. Perry County boasts one of the lowest unemployment rates of all counties in Missouri and has had consistently lower unemployment than the United States as a whole. In 2012, Perry County's unemployment rate was 4.2% compared to the nation's 7.9%, and in 2015, it was 3.4% compared to the 5% national rate (Homefacts, 2015).

Perryville is strategically located along the regional thoroughfare Interstate 55 and is also near one of the few Mississippi River crossings in the area. Many small towns, however, also have such locational advantages. Above all, it was the collaborative and innovative economic policies and partnerships that the town created in response to economic decline, which subsequently led Perryville to become a nationally recognized model for industrial diversification and manufacturing growth.

PLED PROBLEM SOLVING 9.1
Community-Based Business

"The bankers aren't interested. They tried this in the early 2000s, but they had a high rate of loss." The speaker was the head of the new government-guaranteed

(Continued)

(Continued)

bank program. Reunion, a community business development bank, recently had approached local commercial banks seeking participation in a loan program to finance new inner-city ventures. The Reunion Bank was making overtures to use the commercial bank's community reinvestment funds for community purposes. The commercial banks they were approaching had tried inner-city loan funds in early 2000s and were disappointed in the loan losses.

These previous commercial, small, and minority business loan funds suffered from a number of major shortcomings. These funds often employed weak loan criteria and had little or no oversight. Bank managers showed little concern when the loss rates began to mount. In recent years, however, new community-oriented funds have emerged that reflect what administrators have learned from past mistakes. Although the community development banks are a new instrument, they have shown considerably greater success in their repayment rates.

The Reunion Bank's loan committee has identified nine new projects across the city that illustrate the success of the community development bank concept. One of the best examples of community-oriented loan programs is the Business Development Corporation of Centerville (BDCC). The emphasis of the BDCC is on Hispanic entrepreneurship to provide jobs for the area's unemployed population. Although capitalized with nearly $1.5 million in city funds, the first years of BDCC were disappointing, in part because the group followed the Small Business Administration (SBA) model. Community representatives, inexperienced in banking, made decisions. By the third year of BDCC in business, the loan loss rate was reported to have reached nearly 60%.

In that year, the city restructured the loan committee to include banking professionals, and a former commercial bank official was brought in as executive director. Then the development corporation's record of success began to change. During a 3-year period, BDCC made 32 loans to small businesses, mostly in the range of $15,000 to $75,000, with 3- to 5-year repayment schemes. Today, only three of the loans are in default.

Four key factors have made the new loan funds effective:

1. *Professional criteria.* It is important to use strict criteria in financing decisions. These criteria include the applicant's experience in the field, his or her investment of capital, and a convincing business plan.
2. *Careful monitoring.* Close monitoring and identifying if management assistance is necessary is essential to success and requires keeping to a manageable volume of loans.
3. *Training and technical assistance.* These offerings should complement basic entrepreneurship and, in most instances, be required of loan recipients.
4. *Involving others.* Most of the new loan funds, unlike their predecessors, will not fully fund the business start-up. For example, the BDCC will provide financing for only up to one third of the total monies needed, thereby requiring applicants to find other private sources. The involvement of other lenders provides

additional analysis of business plans, as well as enables BDCC to leverage its available loan funds.

The new success of BDCC in recent loan making suggests it can become a major antipoverty force if only it can hold true to entrepreneurial values: creativity, decentralization, and market discipline.

The Cadillac Foundation has become interested in minority lending. The foundation directors, chaired by John Jonas, have directed the staff to consider forming a loan guarantee plan for community development banks. Cadillac wants to support loans to the homeless on a model similar to the Hispanic enterprise programs. How would such a program be designed by the community development bank, or is this just too risky? Mr. Jonas is adamant about introducing a microloan for the homeless, but how would you devise a program using all of the methods detailed previously to move the homeless from their current status to self-sufficiency?

PLED PROBLEM SOLVING 9.2
A Small Town Determines Its Own Destiny

Steelnet's dream evaporated almost overnight. The Midwest Iron Range community, located on a two-lane county road in the northern Great Lakes region, began for just one reason: a low-grade iron ore called taconite. The Reservation Mining Company built the town in 1939 expressly for its workers, who earned good wages, financed their houses on easy terms through an employee credit union, and often had money to burn.

For years, Reservation's taconite mine, a joint venture of the Inland and Republic steel companies, was the most productive in the world. But decline in the U.S. steel industry and competition from other taconite sources finally closed the mine, decimating the town that at its peak was home to 30,700 people. Lacking proximity to anything but its iron mines, Steelnet had to scramble for economic survival. So did its residents—many of whom left as unemployment soared to 85%. The rapid exodus cut the population from more than 30,000 to today's 12,300. The average housing price plummeted to less than $15,000 per single-family home.

Steelnet could have become a ghost town. When the mine reopened a few years later, it recalled just 100 of its 1,500 former workers. What has kept the town alive—and optimistic—is the tenacity of its citizens and the mayor, Don Cole, a retired mine foreman. A smile and an easy laugh are part of the salesman's repertoire, and Cole is a salesman for Steelnet. His first priority was to train the town to market itself through a program launched by the state's Department of Energy

(Continued)

(Continued)
and Economic Development. Named Star Cities, the program is designed to highlight and strengthen the state's most aggressive local development programs.

The certification requirements to become a Star City would daunt many small cities, but Steelnet had one key asset: a pool of unemployed volunteers who combined their talents to make the town a Star City in a record 4.5 months. The achievement won it visibility among state officials, which paid handsome dividends later.

The Steelnet city council also formed the Steelnet Area Development Association (SADA), inviting joint efforts with a nearby township that shares the same school district. Cole and the council never planned to settle for a passive role, even though a small board of citizens assumed control of economic development efforts. The same civic enthusiasm that had achieved a speedy Star Cities designation enlisted 435 individual and 29 business members to sustain SADA projects and committees.

Mayor Cole joined the search for funding sources. He recalled an effort to solicit foundation officials who had never heard of Steelnet and had no idea where it was or why they should care. Cole was a good salesman. He was able to attract foundation grants that provided $55,000 for the city's revolving loan fund, targeted for small business loans to local people who could not qualify for bank credit. Steelnet's skilled but largely unemployed workforce would become its main source of entrepreneurial talent for these loans.

Because the city had relocated its offices to a retail/office complex in a converted school building, the old city hall became an ideal trial site for SADA efforts. A Community Development Block Grant (CDBG) financed renovation of the building, while SADA loans allowed a pool table manufacturer and a small software games products firm to occupy it. SADA has relied heavily on board members' personal knowledge of loan applicants in taking risks. Yet the 20 SADA loans have shown a perfect repayment rate. The city did less well at first, however, in trying to attract new businesses from other areas. On the bright side, Reservation Mining's steady decline offered new opportunities for the reuse of abandoned buildings. A rubber tire plant, expanding to fill the Firestone disaster tire needs, located in a building formerly used by a pneumatic drill manufacturer. The city owned this facility, having purchased it for only $500,000. The new Kelos tire plant is being leased from the city for nearly $50,000 per year, and the tire plant is expected eventually to create 60 new jobs. Two other firms that will also locate in Steelnet to make use of the rubber for auto racing and high-speed windshields may add twice as many jobs by the end of the year.

Steelnet's strategies finally seem to have paid off. This little town didn't give up or die. There is a lesson here for many small towns dependent on natural resources or a single industry.

One of the union leaders is opposing the plan for the reuse of the mining facility by an outside firm. He argues that outsiders are nonunion and that these union-busting firms are the cause of Steelnet's problems. Joe Bartowski, a former union steward, argued that "we should loan some of that money to ourselves and reopen the rubber plant ourselves. After all, we worked in it before," he said. "Who knows the market and the products better than we do?" Mayor Cole thinks Joe is a little crazy. "Working in a place ain't like running it." Who is right? Maybe they both are for different reasons. Or is there something in what Joe says that can be used by Steelnet before they let the new firm in?

PLED PROBLEM SOLVING 9.3
An Incubator as a Revitalization Tool

When the Kanter Corporation, a metal fabricating company, abandoned a 73,000-square-foot facility on three acres of land one mile north of Jonesboro, Kanter gave the land and buildings to the city for $1. Jonesboro originally wanted to use the facility for a new community college, but a feasibility study showed this would not be financially prudent. The Greater Region Economic Development Foundation then asked the city council to allow it to investigate the site's suitability for an incubator facility.

Canton was able to obtain a Small Cities Block Grant to perform a feasibility study. The study, which included a building and site evaluation, marketing strategy, and incubator plan and program, came back favorable to an incubator facility. The Greater Region Economic Development Foundation obtained a $70,000 matching grant from a private donor and a $70,000, 5% loan from the city, with repayment beginning in 3 years. In addition, the city charges the incubator no rent. The $70,000 from the city is money that the city would have needed to spend on security, maintenance, and so forth for the incubator building if it had remained empty.

The Women's Economic Development Corporation (WEDCO) Center will run a business incubator for women-owned firms in Canton. Women who want to rent or lease space may do so only after they have completed a special training program organized by WEDCO. The incubator offers newly established businesses the opportunity to rent space at below-market rates and have access to free telephone receptionist services, secretarial services, business management assistance, custodial and maintenance service, and a business technical library. In addition, the businesses have an opportunity to network with each other. Most of the

(Continued)

(Continued)

entrepreneurs at WEDCO Center either are first-time female business owners or are moving to the incubator from their garage, basement, or barn.

The WEDCO incubator currently houses eight businesses, including a manufacturer of wooden playground equipment, a company that sells bagged ice to convenience stores and bait shops, a firm that makes tools for air conditioner repair, and a computer services business. Lake College also plans to relocate its Business and Industrial Institute to the incubator. The institute will offer 50 different programs, including technical manual writing, computer training, management training, and blueprint reading. Each business in the incubator will be entitled to one free class. The Lake College programs are developing into an entrepreneurial training institute for businesspeople in the area.

The primary function of the incubator's operating committee is to screen applicants. More prospective tenants are rejected than are accepted. The major criterion for acceptance is the business's ability to create jobs for women, either now or in the future. The incubator is not promoting professional people or service sector businesses that offer limited job creation, emphasizing manufacturing and information processing businesses.

The incubator staff assists approved businesses to prepare a business plan and steers them in the direction of local lenders who have been extremely supportive in lending start-up capital to incubator businesses. Each company occupies 500 to 2,000 square feet at a rental rate of $3 per square foot per year. Leases can be for up to 5 years, but no business has signed on for more than 2 years, hoping to move to larger quarters by that time. The incubator is expected to create 120 jobs and currently has a 65% occupancy rate, ahead of the 15% predicted by the end of 1 year of operation.

The community goals of the incubator are to create jobs and ownership for women. Some of the incubator businesses may be able to move to the city industrial park in a few years to help revitalize this city-owned, underutilized facility. By the third year of the incubator's operation, it should be self-sufficient and able to begin repaying the city loan.

The mayor and Regional Development Foundation are now in the process of calculating the return on investment (ROI). They are unfamiliar with the appropriate methods to use. The building with improvements is valued at $1 million. Most of the rental spaces will rent at less than market rates, as discussed earlier. A consultant has been hired to assist making the calculations; however, the committee wants to provide the consultant with the parameters for the study before it commences. What are the variables that need to be considered, and how will the city know if it is in fact making both a social and economic profit?

Notes

1. The first five methods have been identified from the work of the Edward Lowe Foundation (2002), a nonprofit organization devoted to developing entrepreneurship. The sixth is drawn from recent work by the Corporation for Enterprise Development (Dabson et al., 2003).

2. The official title it gave to this effort was the New Economy Project.

3. Defined by the Society of Competitive Intelligence Professionals (n.d.; now Strategic and Competitive Intelligence Professionals) as "a systematic and ethical program for gathering, analyzing and managing external information that can affect your company's plans, decisions and operations."

Human Resource Development

In this chapter, we focus on two critical aspects of human resource development. We begin with the traditional economic development focus on workforce development, surveying the range of practice and efforts to make workforce development more effective in responding to the challenges of the knowledge-based 21st century. Then we turn our focus to education, the essential foundation to workforce and economic development that the practice of economic development has neglected.

Workforce Development

> *Workforce development is not a problem—it is an opportunity—the chance to unleash the creative, productive, and innovative forces, found only in people, for the economic and social betterment of our cities, states, and nations. People-centered development has the unique advantage of promising increased equity, efficiency, and economic vitality.*
>
> —Garmise, 2006, p. 146

The author of this quote is urging us to turn around the traditional problem-focused approach to workforce development. Consistent with the definition of *economic development* guiding this book, Shari Garmise (2006) argued that equity is extended by increasing access to skill and talent development. Further, this extension is essential for an economic development strategy to

succeed in the global economy of the 21st century, in which people and place survival skills are being placed directly on creative and innovative abilities.

We will begin our discussion with a review of the problems that have preoccupied the practice of workforce development in recent decades. There is the concern that certain individuals and groups in society are not able to compete in the emerging growth sectors of biotechnology, electronics, information, computing, and health industries. Another concern is that jobs have literally been moving away from people to suburbs and other nations. In the first case, the new locations for jobs are physically far away from where people (inner-city residents and rural communities) are most in need of work. In other cases, jobs are transforming or disappearing faster than the population has been able to adapt. The clearest evidence of this is the rapid decline in the labor input to the manufacturing sector. However, many service jobs are also being deskilled or eliminated as a result of automation. At the same time, while the postrecession unemployment rate had yet to fall below 8% in mid 2012, employers across all sectors complained they could not find employees to hire with the right skills.

Realities of an Undertrained Workforce

American workers are undertrained for their current jobs and not prepared for future opportunities. While about $60 billion was spent on "human capital investment," the annual survey of U.S. employers by *Training* magazine found there was a significant decline in company education and training expenditures during the early 2000s (O'Toole and Lawler, 2006).

Large companies are more likely to offer workforce training than are small companies (fewer than 50 employees), but O'Toole and Lawler (2006) cited a University of Michigan survey finding that less than 20% of workers took advantage of employer-offered training. They concluded the following:

> Given the nation's growing competitive challenges and the need to create greater mobility (and good careers) for workers, the decrease in the amount spent on training—coupled with the number of employees who apparently are not participating in training programs—leads us to conclude that the already undereducated American workforce also is being under-trained. (O'Toole and Lawler, 2006, p. 128)

Or, as Mark Elliott (cited in Kleinman, 2000) of Public/Private Ventures put it, "It's hard to compete in the global economy with a lame workforce" (p. 2). This is even more the case when the undertrained workers are also some of the most expensive in the world, as can be seen in Table 10.1.

Note: Dash means data not available.

The nation is not preparing its human resources for competition today or tomorrow. Furthermore, even in good times, minority workers are not as well rewarded as White workers, as is illustrated in Figure 10.1, which shows hourly wages for workers with low and high education levels for similar work in the Boston metropolitan area. Race and wage rates in Boston reflect a pattern similar to that of the nation. Race matters, but so do skills. No matter what color the worker, education and training pay. The average families with two or more professionals with professional degrees had incomes of more than $147,000 annually versus a similar family of high school graduates, who had a combined family income of only $48,000 per year. Although even the low-income number is well out of the poverty range, the fact that it takes several members of the household to get this income means that catching up with the professional "Joneses" is impossible to do without an education.

Even as jobs are being shed, people remain an important community resource and are crucial to a locality's economic recovery. Good labor that adds value to production is always the critical asset when it comes to firm location. The United States has tended to place more of its national resources in income-support programs than on job skills development and maintenance schemes. In contrast, other developed nations, such as Sweden, have recognized the need to make job skills development the key component of their labor market programs. This need is only now being recognized here.

Note: Low means low education. *High* means high education—some college or specialized training.

Public Role in Workforce Development

Human resource development has long been a public–private partnership—one that dates back 100 years or more and has involved the public schools.

Initially, informal employment training agreements were made between employers and schools that set certain expectations for the roles to be played by public and private interests to ensure that workers could perform in the workplace. Basically, schools had the responsibility to prepare people to enter the workforce, and the employer had the responsibility to train the worker for the specific tasks that needed to be done at work. Preparation for entering the workforce involved literacy skills, simple math, and a sense of civic responsibility. Some generic skills were also taught, such as measuring and the use of simple tools.

Once students got to the workplace, they were trained in specific skills needed by their employers. On-the-job training was often simple, with factory work being learned quickly. Moreover, people stayed in the same job for many years, gradually progressing through higher skill levels in the company based on performance. Apprentice training was the model for more complex training in crafts, which combined classroom instruction with structured on-the-job training under the supervision of master craftspersons.

Structural economic changes have altered that old compact, beginning with the shift to what has been labeled the New Economy. In general, this term refers to the substantial shifts in industry structure from the effects of the information and communications revolution. But the New Economy continues to evolve as new industries develop, such as biotechnology and nanotechnology, which themselves have profound impacts for traditional as well as emerging industry. The overall result is that the kind and level of training required to enter the workforce for many jobs are greater and must be responsive to the needs of quickly evolving industry.

While it has been estimated that 90% of the fastest-growing jobs will require postsecondary education, an increasing number of people come to the workplace without even the basic skills expected (U.S. Government Accountability Office [GAO], 2007). Recent adult immigrants, for example, lack language and work skills, and people who get displaced from certain jobs because of technology need to acquire a number of basic skills just to be able to undertake regular training programs. People older than school age thus find themselves needing special programs, which may be available only through partnerships with employers. Furthermore, the very high dropout rate from high school by low-income and minority youth, including many first-generation immigrants, also creates many barriers for participation in the New Economy.

Government at all levels—federal, state, and local—has an important role in providing support for a workforce development system. The last major federal program development for this resulted from the passage of the

Workforce Investment Act (WIA) in 1998. By 2012, the WIA was considered long overdue for reauthorization and criticized for not responding to changes in the economy. The National Skills Coalition (n.d.) observed that "the law's original emphasis on short-term training and rapid re-employment is increasingly inconsistent with growing demands for longer-term training aligned to high-growth and emerging industries." The current structure of the WIA is described next.

Under WIA, responsibility for managing the programs devolved from the federal government to the states, and ultimately to local Workforce Investment Boards (WIBs), which make most of the decisions. In contrast to previous approaches, the WIA recognized that training needed to respond to the following:

- Economic swings that had more to do with the readjustment of the competitiveness of major industries than periodic cycles
- Global competition that led to unexpected swings in markets with consequent employment impacts
- Firms and employees that did not change would be left behind and suffer not only unprofitability but also extinction
- Employees who were likely to change jobs and careers as many as 10 to 15 times in their working lives due to necessity and opportunity
- Unskilled or static-skilled workers who would be left out of the New Economy

The WIA asked for stronger coordination among multiple training and service providers in the context of one-stop career centers that would allow individuals more flexibility to choose from a larger number of training options linked to employer needs. Thus, a majority of the WIB membership is composed of business representatives. For the first time, the WIA program permitted the use of resources to train employed persons. Previously, funding was restricted to unemployed persons. The WIA also provided new employment-generation tools that states can use to transform their workforce development programs.

Economic developers have found that partnerships with institutions engaged in workforce development provide many benefits. From the training providers' perspective, changes in the economy and federal regulations have combined to force them into a three-way partnership with business on one hand and economic development organizations and training providers on the other. Consequently, government resources and private resources are being used more effectively as trainers seek to ensure the service they provide is directly related to what business really wants and that the people they train can find jobs in the most promising firms. Economic developers in turn realize that they need the training professionals to produce a top-quality workforce

that is able to meet the needs of existing businesses or the businesses that might be attracted to the area.

The economic developer wanting to utilize a human resource approach to building jobs and creating a stronger economic base in the community must first identify the existing programs at the core of the workforce development system. These major training institutions increasingly are partners in economic development, a recent trend necessitated by the growing awareness that training programs can partner with job development programs and thereby make both systems more effective. Thus, the primary training providers are increasingly also the leading strategic economic development resources for local community leaders. Some examples follow.

- *Job training programs*. The federal job training providers are typically nonprofit contractors who work with the federal programs to train people in specific skills or sets of skills. This also includes state-supported training programs, which often contribute funds to businesses that provide their own curriculum and instructors.
- *Nonprofit community development corporations (CDCs)*. Increasingly, nonprofit housing, social service, and other programs are providing job training to their clients, often including disadvantaged groups, immigrants, women, inner-city residents, and so forth.
- *High schools*. The high school, as a resource for community economic development, offers an untapped but growing potential for students and teachers. The schools have many opportunities to couple teaching with internships, business formation, and summer activities for both students and faculty.
- *Adult education programs*. The public school system in most communities also sponsors an adult school that offers courses in English as a second language (ESL), job skills, and recreational and cultural topics.
- *Nonaccredited postsecondary training programs*. Training institutions are often connected with industries and certificate programs that train students. These programs are typically run by business associations, unions, or equipment suppliers specifically for a set of firms. Nonaccredited programs are also provided by schools that charge students fees, promising them training for jobs related to cosmetics, truck driving, sales, or computer repair.
- *Accredited colleges and universities*. The range of accredited programs starts with 4-year colleges and universities, in which new programs are linking coursework with industry areas. In addition, and increasingly important in economic development, are community colleges that provide specialized training for industries on a fee basis. Community colleges also partner with other economic development programs to provide training and technical assistance to local firms.

In addition, federal and state programs link employment training with other programs. For example, in the area of health and welfare, programs include senior community service, job services, veterans' programs, Wagner–Peyser Act funds, trade adjustment assistance, vocational rehabilitation and supported employment, food stamps, employment and training, and refugee assistance. Many states have conservation corps and programs for troubled youth. In areas of housing and community development, many job training programs and employment services are targeted to residents. Finally, the Stewart B. McKinney homeless assistance programs and inmate employment and vocational education for incarcerated youths and adults also provide training resources.

Coordinating these various training resources is a massive task that is increasingly assigned to WIBs and their one-stop service centers. The types of activities undertaken by these human resource–coordinating programs depend on the local situation. Generally, their task involves doing more than just assuring that training is available, such as the following:

- Managing workforce training schemes, such as group apprentice schemes, adult retraining, and new training initiatives
- Offering business support services that increase employment
- Developing shared facilities for training activities
- Operating general literacy and community education projects
- Developing on-the-job training and work experience activities for young adults
- Attempting to reduce discrimination in employment for disadvantaged groups

These many training avenues can actually achieve significant economic development goals in a local community and result in good partnerships for all. Using a human resources strategy implies that community economic development goals are pursued in tandem with the training and educational assets of the workers, helping businesses to grow and to locate in the local community.

Goals of Human Resource Programs

Human resource programs are typically focused on one of four categories of workers who are developing skills needed by employers. First, programs focus on people *entering the workforce for the first time.* Typically, these are youth or high school students but also immigrants, homemakers, welfare recipients, disabled people, and other groups. Programs for these people include considerable attention to basic work skills and work readiness, as well as help in the job search.

First-time entrants to the workforce have traditionally been helped in schools, but the schools have not always done an adequate job of preparing people for work due to the emphasis given to preparing people for college. A national program called the School-to-Work program has helped schools better address the students not going to college. Other programs throughout the country help individuals gain practical work skills, prepare resumes, and learn job search skills.

Second, some human resource programs focus on people who have been *displaced from the workforce* and are unemployed, seeking to return to work. The old model assumed that when individuals lost their jobs, unemployment would be temporary and they would be recalled when economic conditions improved. However, increasingly, the people losing their jobs are finding that the layoffs are permanent.

Traditionally, workforce development personnel were reluctant to train displaced workers for two reasons. Trainers believed that workers were temporarily laid off and that, at a moment's notice, they would go back to work. It was also believed that such programs were unnecessary for laid-off workers because they presumably had adequate skills for the job.

Third, workforce programs have focused on providing training for *incumbent workers* who need to upgrade their skills in order to remain competitive in their firm and for the firm to remain competitive with other firms. Business itself is the largest provider of workforce training, without assistance from government or economic development programs. Reportedly, business spends some $6 billion on training each year, though the majority of that goes to management and high-ranking professionals. Nonetheless, throughout companies, considerable training goes on to improve workforce skills. These efforts are strongly supported by training programs that are tailor made for certain skills. Courses in commonly used software or in safety when working around high-voltage lines are examples. In addition, businesses that require licenses for certain jobs need to provide both initial training and recertification programs. Professional conferences typically train people in new techniques and legal requirements that affect their business.

Workforce programs can also be targeted to *potential employees* of firms that are being attracted, that are moving into an area, or that are expanding. These firms see worker training as a major cost of doing business in an area and often look to workforce development programs to help support training their new workers. Typically, worker training benefits account for a large proportion of the incentives given workers under business attraction schemes (see Chapter 8), as they are a large one-time cost associated with a relocation or expansion. In these cases, specialized training programs are funded by using either training professionals from the firm or faculty at specific training institutions, such as community colleges or private training firms.

Matching Human Resource Programs and Economic Development Objectives

The following paragraphs give more detail about the various types of human resources development and training programs in existence. The correlation between job placement efforts and economic development is also discussed.

Workforce Investment Boards

Generally, local employment and training boards, formerly known as Private Industry Councils (PICs) and now WIBs, are more than happy to cooperate with local employment strategies if they are aware of the economic development goals of the community. They have been created to repair the continuing gulf between employment and training efforts and economic development, particularly for the disadvantaged. In the past, preparation for employment has been a "revolving door" for many people. They attend courses that frequently lead to dead-end or unsatisfying occupations, only to be sent to additional training as a remedy for their unemployment. Recently, with the help of WIBs, community groups have attempted to pull together local business and community-based economic development programs into a single employment network.

For example, WIBs attempt to coordinate the frequently fragmented efforts of parties interested in employment within a region. Although they vary in composition, WIBs generally include representation from key local firms, local government, state government, unions, and educational institutions. The members of the board must commit themselves to creating more flexibility in both training systems and job entry arrangements.

WIBs must also pull together multiple government-sponsored training initiatives and integrate them with local economic development. One of their major responsibilities is to identify and encourage new ventures that have skill requirements readily met by local people. Another is to match local training activities with the needs of local employers.

Community employment programs (discussed in the previous chapter) offer an appropriate mechanism for coordinating economic development and employment. They offer a vehicle for communities that wish to combine the community-based concept with more traditional economic development activities.

First-Source or Targeted Hiring Agreements

First-source agreement refers to a contractual obligation entered into by firms that receive substantial government assistance, such as tax holidays and

government loans. Under the contract, the assisted firm agrees to interview, as the first source, local people for the available positions. After reviewing them, the employer may select anyone for the vacancy. This agreement generally stipulates the referral source and the number of referrals required before the employer can place advertisements or interview persons from outside the specified geographic area. First-source agreements historically have been targeted to firms directly. More recently, a variant of these agreements is being incorporated into community benefits agreements (CBAs) targeted toward developers of large-scale projects. That is, in the legally enforceable contract between community groups and a developer that the CBA represents, targeted hiring is one of the specific benefits being spelled out. This is done to ensure that the promises of job creation that come from developers and from local government agencies promoting the development will benefit the community from which both parties seek cooperation and approval.

In their manual on CBAs, Gross, LeRoy, and Janis-Aparicio (2005) have suggested that possible target populations might include the following:

- Individuals whose jobs are displaced by the development
- Residents of the neighborhood immediately surrounding the development
- Residents of low-income neighborhoods anywhere in the metropolitan area
- Individuals referred by local, community-based job training organizations
- Low-income individuals generally
- "Special needs" individuals, such as public assistance recipients or ex-offenders (pp. 45–46)

In some instances, firms will request local referral voluntarily as a civic obligation in high-unemployment areas. These voluntary efforts are also used to stimulate employers to look at local youth as a first source. Youth-oriented first-source agreements generally have a "job tryout" component.

Employment Maintenance

Employment maintenance or support programs use unemployment funds to develop jobs for hard-to-place people. In this scheme, a local government or nonprofit organization receives the welfare payment as a subsidy for employing a person at the full wage level. A large number of CDCs have employed this approach with considerable success. This type of project was one of the keystone initiatives of the Clinton administration. Many urban and rural local governments have indicated an interest in this type of

program as a means of restoring teachers' aides, playground supervisors, assistant librarians, and many other paraprofessional positions.

Skill Banks

This is a relatively simple concept, aided by the advent of the microcomputer. The idea is that the employment officer or a local volunteer group or other person(s) collects refined information on the skills and backgrounds of local unemployed persons. This skill inventory can be used for a number of purposes. First, it serves as a source of community data on the nature of the job development needs of the unemployed. Frequently, communities know that there is high unemployment, but they do not know what kinds of skills the unemployed have or the kinds of jobs they need. The skill bank helps address this problem. Second, the dominant use of the skill bank is its inventory of skills that can be matched to available vacancies in the local area. Finally, skill banks collect unemployed people into cooperatives or community-based employment initiatives. A skill bank is an invaluable tool for assessing local abilities and building new jobs or services on the basis of these skills.

To initiate a skill bank, organizers should first do a survey to document the demand for various occupations or skills and the availability of skilled labor to fill those needs. As a second step, the existing training and education facilities in the region should be assessed by their accessibility, suitability, and ability to meet further labor market needs. Recommendations for upgrading, extending, or modifying education/training programs should be made on the basis of these studies.

Training Programs

> Particularly in the last decade, an observable convergence of trends has heightened the need for more, and better, job training: the increasing speed of technology change, the increasing sophistication of foreign competitors, the export of manufacturing jobs, downsizing due to pressures to increase productivity, shortcomings in the quality of formal education (particularly at the high school level), and the aging of the workforce. All told, those trends amount to an almost perfect storm, creating an ever-increasing need for workers to update their skills regularly and, often, to develop entirely new ones. (O'Toole and Lawler, 2006, p. 127)

In this section, we review a range of training concepts developed, with more or less success, to tackle labor force problems in local economic development. Most contain provisions for special courses to meet the needs of local employers and include upgrade training, apprenticeship courses,

retraining of dislocated workers or of women reentering the workforce, as well as traditional course offerings. Local training councils, such as WIBs, help to integrate these efforts with local development strategies. For example, communities that embark on tourism strategies need to develop courses that provide initial education and upgrade the skills of those already in the hospitality industry. Wolman, Lichtman, and Barnes (1991), after examining education, training, and skills, concluded that training in a specific skill area does have a significant payoff for the underskilled. Specialized training approaches include the following.

Customized Training

The concept of customized training is relatively simple. It provides training either at the employer's site or at the local college through courses specifically designed to meet employer expectations. Human resources are thus used to attract business because of the reduced cost of staff development.

Although this type of program is usually reserved for new firms moving into an area, it may also be used by existing firms that are expanding. These programs are typically operated at the state government level to support their industry recruitment efforts. Two of the best known are North Carolina's NCWorks program and Georgia's Quick Start program. The latter program reported for fiscal year 2015 that 10,611 jobs were created or saved, 115 customized workforce training projects were delivered, and companies from more than 15 countries used the program (Quick Start News, n.d.).

An early (1987) innovative customized training effort was the Ohio High Unemployment Population Program (HUPP), which targeted training and employment services to chronically unemployed minority males. In this program, the employer's premises were used as a home base or site to aid participants in on-the-job training and education for a credential or degree. The basic idea was for a person to develop job habits and a job resume while gaining a degree. Today, prominent nonprofit training programs focused on hard-to-reach, long-term-unemployed individuals are administered by Goodwill Industries and the St. Vincent de Paul Society.

Competency-Based Training

In competency-based training, human resource professionals work with a group of employers to articulate the competencies that are required for workers in a particular industry. For example, a group of banks simplified their training into three sets of tasks (i.e., cashier, financial analysis, customer service) and developed the specific skills that were necessary in each. A hierarchy of skills allowed people to be trained for simple tasks first and

more complex functions later so that they could progress in their track and receive more challenging jobs. As they received training, each employee received a certificate that was recognized by other banks.

Overall, this strategy is similar to the training in many apprentice programs sponsored by unions, and it allows workers to move easily from one employer to another. From an economic development perspective, it can simplify training programs and reduce costs for all the firms involved. Although many tasks in the New Economy do not fit well into competency-based programs, an increasing number of employers can benefit from the better training such programs provide.

Comprehensive Training to Meet Social Needs

The strong link between human resource development and meeting the social needs of people outside the workforce is readily apparent to anyone working with persistently unemployed persons. For example, a key barrier for many welfare families is the lack of child care. In other cases, substance dependency or physical disabilities may be a barrier to steady employment.

Community-based organizations serving groups with barriers to full participation in work often are in a position to provide multiple services and training. One example is a program in Oakland, California, that used various public and private funding to assist the hardest-to-place persons. This program was comprehensive in that it did full intake assessments and started with work readiness training, such as timeliness, work attire, persistence, and so on. Participants were assisted in solving important social problems like finding housing and child care, getting proper clothes or tools, and being sober and safe. They were also helped to identify at least three jobs and careers paying at least $14 per hour for which they could be trained, based on prearranged contacts with potential employers who agreed to take the graduates. Students were then placed for trial periods at the workplaces, where they could observe each job. Many found that the job they thought they wanted was not good for them (e.g., a student thought she wanted to be a nurse but discovered a fear of blood). After choosing their job, students received intensive training supported by internships and on-the-job supervision as they progressed. Upon graduation, they remained in touch with the program to ensure that problems could be solved.

This program was so successful that students had a high level of security that they would remain employable, with only a few needing more training. But this approach is expensive and intensive, something for which funding is not always adequate.

Youth Enterprise

There is growing interest in helping young people to become acquainted with business development. In part, this is an attempt to rekindle entrepreneurial spirit in the nation's youth. It also represents a new emphasis on helping people create jobs for themselves rather than waiting for jobs to be created for them.

Youth enterprises have been started through the Community Youth Employment Program as well as various service clubs, community-based organizations, and schools. These vary in size and focus, and a few have become major self-supporting enterprises.

The basic idea is to start businesses within the skill range of youth to give them some experience in how the business system works. Community-based groups have considerable resources and training to foster such activities. They can offer vacant space or equipment to the youth enterprise as well as mobilize service clubs and others to provide the technical assistance for the projects. Youth enterprise has even developed to meet critical needs of communities.

The Bulldog Express is a student-run grocery store in the small rural town of Leeton, Missouri. It began in 2009 and has drawn national attention. The town had lost its only grocery store 10 years earlier, and the closest grocery store was 15 miles away. The store is located in what was a closed bank building. Leeton school administrators and students worked together to form the store and received broad support from the community. Students staff, stock, and manage the store, receiving earnings and valuable business experience in the process. The store provides essential goods to the community and a gathering place for the small town, and is particularly appreciated by senior citizens for whom driving has become more difficult.

University–Industry Technology Transfer

One of the most interesting sets of human resource programs involves universities sharing their research with local businesses. Although some technology-transfer programs are limited to patents and products, many find that the most effective flow of technology is through students trained in specific programs to meet specific needs of industry. For example, university programs in biotechnology can meet the needs of industry, whereas less specialized biology programs may not.

University programs operate either by providing specific project support to firms wanting new technology or by making scientific results available to businesses with whom they are shared. Many states have created specialized technology programs in which business funds part or all of specific research projects.

Examples are Pennsylvania's Ben Franklin Technology Partners and the New York Centers for Advanced Technology. All these programs leverage private funding of faculty research and train students—usually graduate students—who apply their knowledge in industry, often in nearby industrial parks.

University programs that maintain specific project-by-project collaboration with industry benefit all participants. For example, the University of California Toxic Substances Research and Training Program leverages faculty interests by linking with firm needs. In this instance, graduates of the university program receive not only good industry–university education but also the benefit of a new generation of products and processes to detect, control, and remediate toxic substance problems in the environment.

Although university relations with industry are most clearly seen in tech parks, such as Stanford Research Park (electronics industry) and Research Triangle Park (North Carolina), college and university programs in fact work with industry at many unseen levels because of the common flow of people and ideas from university to business.

Self-Employment Initiatives

These initiatives attempt to assist unemployed people of any age to create employment ventures themselves, using their own labor as the primary resource. They include small business start-up efforts in which the unemployed receive small loans and grants to initiate a new, independent, community-serving business. During the period when the business is being organized, unemployed persons receive an allowance equivalent to an unemployment benefit. This allows the enterprise to reach the stability point before wages have to be paid.

There also are programs available that support self-employment ventures organized by a group rather than by an individual. In these projects, such as the microloan programs discussed in Chapter 9, a specialist works with groups to examine opportunities and exploit them using unemployed persons as the basic resource.

Career Ladders

Career ladder programs are aimed at helping workers in low-skill and low-wage jobs move into higher-level and more secure employment. For example, Fitzgerald (2005) noted career ladder programs have helped nurses' aides to become licensed practical nurses and clerical workers to become information technology (IT) workers. The career ladder programs identify the training and education needed for the worker to move up the

ladder and provide support services and financial aid to help the worker prepare (Fitzgerald, 2005).

Disabled Persons Skills Development

Physically, emotionally, and educationally disabled persons have always had difficult placement problems. Intervention in this situation ranges from sheltered workshops to employing a special disability placement officer (DPO).

The DPO is responsible for seeking out employment opportunities for disabled persons that fit their capabilities. With modern equipment, there are more of these opportunities than most employers realize. The job of the DPO, then, is to see how the work environment can be made to fit the person rather than the person fitting the job. The DPO also provides employers with information on assistance schemes for disabled persons and their employers. Local governments can assist DPOs and the disabled by being positive examples, such as including the disabled in the development planning process and by allowing council offices to be used by the DPO or others working on issues of the disabled.

Education as the Foundation of Human Resource Development

There are two major reasons that economic developers focus on human resource development. First, referring to our definition of local economic development, we seek to provide sufficient and rising standards of living for all persons in the economy, reducing inequality in the process. This requires giving individuals the opportunity to attain this standard of living through quality employment and good compensation packages. This, in turn, requires providing quality education opportunities. It has been estimated, for example, that every additional year of education increases a worker's earnings by 10% (Schweke, 2004).

Even if we were to fall back to the traditional definition of *economic development* that simply emphasizes job and wealth creation, the importance of a well-educated labor force should be clear. At a minimum, employers need workers with strong basic skills. The most desirable employment in today's knowledge-based economy, however, requires advanced education and skill levels.

Thus, it seems logical that when economic development has focused on the role of education, it has done so primarily at the university or

postsecondary level. We discussed previously the role that community colleges and vocational and technical training institutions play in providing employee training. There has been a long-term trend away from employers providing in-house training to workers; the role of vocational–technical (or voc–tech) schools and community colleges has become more important as a result. Working closely with these institutions is a key component of a human resource–based economic development strategy.

Less appreciated is the idea that local economic developers should also be concerned with the quality of the local prekindergarten and kindergarten through high school education systems. With regard to prekindergarten or early childhood education programs, economists have found that investments in these programs bring significant public and private returns on investment (as much as 16%). Indeed, Grunewald and Rolnick (quoted in Schweke, 2004, p. 16) stated, "We are unaware of any other economic development effort that has such a public return, and yet early childhood development is rarely viewed in economic development terms."

Additionally, there are a number of reasons economic developers should concern themselves with the quality of the local K–12 school systems. First, quality primary and secondary school systems generate higher proportions of students who qualify for advanced education and training that generates higher-quality employment and earnings opportunities. Second, quality primary and secondary school systems can help to attract the firms that make up the knowledge-intensive sector of the economy. These firms may seek to hire local workers as well as seek high-quality communities for their existing employees. The lack of quality primary and secondary education has been shown, for example, to be a barrier to growing the biotechnology sector because firms cannot attract needed research scientists (Leigh, Wilkins, and Riall, 2001).

Third, providing high-quality school systems, particularly in low-income areas, increases the likelihood that disadvantaged or at-risk youth will graduate. This, in turn, has been shown to reduce crime and incarceration rates as well as welfare dependency (Schweke, 2004). All of these factors increase the attractiveness of a local community as well as free up public resources that can be devoted to improving the local economy.

Implementation of a Human Resource Development Strategy

Economic developers interested in applying a human resource development strategy in their community to expand jobs and improve community

well-being need to discover how the increase in skills of current or potential workers can expand opportunities for groups of people or businesses currently not fully participating in the local community.

Knowing about training gaps and workforce problems of employers is key to identifying a possible development opportunity. The examples in Economic Developments 10.1 through 10.4 show how some businesses and communities responded to changes in the economic climate of their community. Table 10.2 offers several ideas to help get a human resource project started.

ECONOMIC DEVELOPMENTS 10.1
Betting on Downtown Las Vegas*

In the late 1960s when the flashy casino "Strip" located 5 miles away established itself as the central tourist and entertainment destination, downtown Las Vegas began to decline. New big box retail stores and shopping malls sprang up in nearby suburban-like neighborhoods, supporting vehicle-centric lifestyles at the expense of the downtown shopping core. Development sprawled out to surrounding plentiful and cheap land and over time, downtown became a disinvested, crime-ridden area. Las Vegas was also devastated by the 2008 financial crisis and by 2010 had more foreclosures than any other city in the United States (Berfield, 2014).

In 2012, CEO Tony Hsieh announced his multibillion-dollar company, the very successful online shoe retailer Zappos Inc. with more than $2 billion in annual sales, would relocate from its existing headquarters in a suburban office park in Henderson, Nevada, to the previous city hall site in downtown Las Vegas. The move was estimated to have long-term regional economic impacts upwards of $336.6 million and to add $395,000 in annual property taxes to the city (Miller, 2012).

The relocation of Zappos is part of CEO Tony Hsieh's larger vision to transform downtown Las Vegas into a denser, more livable and walkable community. He and several partners are also investing $200 million over 5 years in downtown real estate projects as well as $50 million each to small businesses, tech start-ups, and arts and education. To attract development, Hsieh's Downtown Project offers no-interest loans and salaries to business owners, which will be repaid by their eventual profits. Thanks to the funding, bars, clubs, restaurants, and even a gourmet doughnut shop and gluten-free pizzeria have opened. The Downtown Project is responsible for Container Park, an outdoor mall made of shipping containers, and the Gold Spike, an old casino rehabbed into an informal work/live/play space that replaced slot machines and blackjack tables with lounge chairs, a bean bag toss, and fire pits (Berfield, 2014). Ideally, these revitalization projects will attract innovative entrepreneurs, strengthening the creative profile of downtown workers and residents.

City officials have been enthusiastic about the Zappos relocation and Hsieh's Downtown Project. This sort of innovative development, however, isn't without risk. Some downtown businesses, including a bar and several coworking spaces, have already closed their doors (Berfield, 2014). Small robotics maker Romotive, supported by the Downtown Project's $50 million technology fund, grew so rapidly that it had to relocate to the Bay Area because there was not enough technical support available in Las Vegas ("Delivering a New Downtown," n.d.). The question remains whether Hsieh and a small group of like-minded innovators can build on the success of Zappos to transform the downtown district. Another key question is how much the original residents of the Las Vegas community will benefit from these projects, especially since there is no official community benefits agreement (CBA) that would guarantee predefined neighborhood improvements from the new development. Professor of sociology Michael Borer from the University of

Nevada, Las Vegas, criticizes Hsieh's vision of downtown Las Vegas as a "blank slate" that "overlooks an existing culture that has high numbers of people struggling with low incomes, physical and mental disabilities and unemployment" ("Delivering a New Downtown," n.d.). Indeed, very few local residents actually belong to the creative class Hsieh hopes to attract. The Zappos relocation and Downtown Project reflect the growing trend of companies moving from sprawling suburbs back to urban centers that, while creating economic revitalization and wealth, also raises concerns about gentrification and displacement of existing residents.

ECONOMIC DEVELOPMENTS 10.2
A Holistic Approach to Workforce Development*

The Southwest Alabama Workforce Development Council (SAWDC) is 1 of 10 regional workforce development councils established in Alabama in the mid-2000s to provide a more direct link between local labor forces and the workforce needs of local industries and businesses. The Alabama Department of Commerce's Workforce Development Division provides support to the regional councils, headed by business leaders in each locality focused on creating regionally centered workforce development systems. SAWDC is also responsible for approving workforce development grant applications from community colleges in their region and submitting those applications for state funding. Between 2008 and 2014, $20 million in community college grants came into the region—about 25% of total state funding. This is a significant amount since the Southwest region makes up only 14% of Alabama's total workforce (Davis, Chandler, and Covert, 2013).

SAWDC formed in 2008 and is governed by a board of directors and council members made up primarily of local business and industry leaders as well as various economic development officials. (See Figure 10.2.) This helps to integrate the SAWDC commitment to producing a quality workforce with the region's economic development goals. In 2011, SAWDC joined the National Fund for Workforce Solutions, a workforce intermediary initiative focused on career advancement of low-wage workers through employer partnerships. This initiative was supported by the Social Innovation Fund. The National Fund provided SAWDC with funding totaling $780,000 through 2016 to pilot workforce development programs, matched by SAWDC through $780,000 in cash contributions as well as $6.3 million in aligned funding from other organizations (Quimby, 2016).

SAWDC implemented the National Fund's model by establishing four workforce partnerships based on industry clusters with high labor demand in the southwestern Alabama region. These clusters include maritime, aviation, industrial

(Continued)

(Continued)

construction/manufacturing, and health care. The council promotes the industry cluster framework by connecting training providers such as the community colleges in the SAWDC region to employer needs within those clusters. SAWDC works with the community colleges to develop workforce-training programs on a case-by-case basis stemming from these pinpointed demands. SAWDC then works with the Alabama Career Center to recruit and screen potential employees and offers on-the-spot training based on skills needed for the existing job gaps. SAWDC's workforce partnerships focus on breaking down barriers to successful training, such as lack of job placement assistance and career center/community college connections. Community colleges, for instance, must get all workforce development programs approved by the council to ensure resources are properly aligned to fill existing skill gaps (Laura Davis Chandler, personal communication, January 29, 2016).

The Maritime Workforce Partnership was the first cluster partnership that SAWDC created, bringing together global shipbuilder Austal USA, the Gulf States Shipbuilders Consortium, Bishop State Community College, and Mobile Works, the local workforce development board. The cluster had much potential for growth due to unmet labor demand and the relatively high wages and benefits offered to employees in the industry. Besides direct training offered through the AIDT Maritime Training Center (MTC), SAWDC also developed a project management and coaching model, including an onsite industry coordinator at the MTC to work with participants throughout training. This improved what previously had been a weak linkage between training completion and job placement. Maritime cluster worker training has resulted in more than 800 new maritime employees and 58 incumbent workers with upgraded skills, and a $3.50 average increase in hourly wages (Quimby, 2016).

As part of the health care industry cluster initiative, SAWDC partnered with the Bay Area Healthcare Coalition to design programs aligned directly with health care employers' needs. Employers had been facing high turnover rates of entry-level certified nursing assistant (CNA) positions, creating a high demand for incumbents with training in acute care. SAWDC coordinated eight CNA pilot program sessions for both new workers without certification as well as incumbent CNAs in need of skill upgrades. As a result of the training, 99 workers elevated their skills, and 37 received CNA certification. SAWDC also advocates for the workers that participate in the training by forming agreements with employers that benefit from workforce development. In this case, after the incumbent workers completed the CNA training, they all received wage increases of 5% (Laura Davis Chandler, personal communication, January 29, 2016; SAWDC, n.d.).

SAWDC continually tracks and reports program outcomes in terms of rates of successful completion, employment placement, and job retention (Davis et al., 2013). These metrics create a constant feedback loop and provide SAWDC with quantitative information to identify improvement areas of the training programs. For instance, in the case of one training program, SAWDC data showed that the pass rate to qualify for training was only 50%, since many potential participants lacked fundamental math

and reading skills. In August 2015, AIDT collaborated with local employers to establish a foundational program to build these critical skills. Up to 60 people have already completed this pretraining—some of which have continued on to industry-specific workforce training (Laura Davis Chandler, personal communication, January 29, 2016).

SAWDC also considers K–12 career awareness a critical component of successful, regional workforce development. Though the council's central focus is on adult training, SAWDC remains involved in K–12 youth programs by establishing implementation partners such as the Mobile Area Education Foundation (MAEF). MAEF helped create a dual-degree credit program for high school students at a local secondary school with an aviation and aerospace specialization. Students can spend their junior and senior years taking courses at the two-year Alabama Aviation Center and participating in an internship in the aviation field. These partnerships allow SAWDC to maximize funding through complementary programs in

Figure 10.2 The Southwest Alabama Workforce Development Council, Region 9

(Continued)

(Continued)

the industry clusters, and avoid doing duplicative work (Laura Davis Chandler, personal communication, January 29, 2016; Davis et al., 2013).

SAWDC brings together key stakeholders from local businesses and industry clusters, local government, nonprofits, K–12 schools, and community colleges to target existing skill gaps between local employment needs and low- to moderate-income populations. Over the past 5 years, SAWDC has served over 1,300 jobseekers and 181 incumbent workers. SAWDC hopes to build upon these positive results by planning for future opportunities such as meeting the future training needs of aviation suppliers expected to locate to the region thanks to Airbus's new production site in Mobile (Quimby, 2016). By expanding existing regional partnerships, leveraging funding for potential programs, and tracking program outcome data, the intermediary approach of SAWDC continues to align training for the local labor force with the needs of employers in specific industry clusters and enhance the region's competitive advantage.

Acknowledgments: The authors gratefully acknowledge Laura Davis Chandler, executive director of SAWDC, for her contributions to this case study.

ECONOMIC DEVELOPMENTS 10.3
The Inverclyde Training Trust

The Inverclyde district of Scotland lies in the west Central Lowlands and includes the towns of Port Glasgow and Greenock. Shipbuilding was the area's major industry with 6,500 workers in 1981. By the end of the decade, however, fewer than 1,000 shipbuilding jobs were left (Fitzgerald & McGregor, 1993).

The workforce intermediary, Inverclyde Training Trust (ITT), was established in 1986 as a training placement agency. The leaders of ITT understood that, due to international competition, there was little chance that shipbuilding would return as a significant regional employer. There was a critical need to help displaced workers acquire new skills to fill vacant positions in local companies as well as to attract new businesses to the region (Fitzgerald & McGregor, 1993).

The ITT role as an intermediary training broker spurred local economic development by providing a stable system to match unemployed workers' individual needs with existing training programs available through the national and local governments, as well as the European Social Fund. As a freestanding training broker that promoted separate training programs, ITT needed very few internal resources to sustain itself (Fitzgerald & McGregor, 1993).

Surveys of ITT participants from the late 1980s and 1990s indicate mixed results from the training placement program. During this time, there was a 95%

completion rate, but only 50% of former shipbuilders and one third of participants from other industrial sectors found employment or pursued further education after the initial training. While only 50% of displaced shipbuilders considered their training helpful in finding employment, 91% indicated they would recommend the training to others. This positive perception may have to do with the soft skills participants acquired during the program. In fact, 33% of trainees emphasized personal confidence rather than job-related skills as the most advantageous takeaway from the training (Fitzgerald & McGregor, 1993). This increased confidence helped unemployed shipbuilders seek out jobs in new industrial sectors. The Inverclyde enterprise zone, which lasted from 1989 to 1999, worked in parallel with work training programs to attract businesses in new sectors. From the early 1980s on, tax exemptions offered within the zone attracted more than 30 businesses to Inverclyde, employing around 2,750 people. Many of the new companies located on redeveloped shipyard sites ("End of Inverclyde," 1999). As the ITT helped to enhance the skills of local residents, the enterprise zone was critical in providing posttraining job opportunities.

The ITT merged with other local organizations in the mid-1990s to form the Inverclyde Community Development Trust (ICDT). Known locally as the Trust, the organization continues the mission to "contribute to the overall economic development of Inverclyde by providing or creating jobs for people from disadvantaged groups or areas" (Development Trusts Association Scotland, n.d.). One ICDT department is "Trust Employability Services," which offers support through digital CV and online application workshops, digital job search assistance, interview skills support, job matching, and job training.

Although there is some overlap of services offered, unemployed residents receive training services separately from low-wage and/or underemployed workers. Some of the services for the unemployed include information technology (IT) training, goal setting, customer service training, social care skills training, youth employment support, and personal development workshops. Examples of current services for low-wage and/or underemployed workers include health and safety certification training for the construction industry, customer service skills, and first aid training. The Trust offers workshops in the classroom and through an online e-learning platform (ICDT, n.d.). It has formed various partnerships over the years with public sector organizations such as the Inverclyde Council and Objective 3 Partnership to deliver these employability programs (Development Trusts Association Scotland, n.d.).

The Trust was founded on the principles of creating employment opportunities for those affected by shipyard closures in the 1980s and has progressed to incorporate technology training and other services relevant to the community's needs today. The initial formation of ITT as a training broker rather than training provider, as well as its role as an evolutionary intermediary that supports residents' dynamic needs, has made it a long-term catalytic force of local economic development in Inverclyde.

ECONOMIC DEVELOPMENTS 10.4
The Mark of the Maker Movement*

Accompanying the "maker movement" has been the rise of "makerspaces" and tech incubators that provide individual entrepreneurs and start-up businesses the space, advanced hardware, and software to transform innovative ideas into tangible products. Makerspaces are popping up in old warehouses and industrial facilities, office buildings, and public spaces such as public libraries and universities. These transformative spaces have increased accessibility to innovative technologies and tools, previously limited to big companies, to local, creative minds that now have the means to fabricate products faster and more cheaply. 3-D printing, for instance, allows makers to transform digital designs to injection moldings within the same day. Besides access to products like 3-D printers, laser cutters, and specialized design software, crowdfunding through public-benefit corporations such as Kickstarter enables adequate funding for local manufacturing. Innovators present their ideas on Kickstarter's website, and viewers can choose to support and fund particular projects. According to Kickstarter's website, $2.1 billion has been pledged to individuals and small businesses. Once the makers finalize their products, local retailers and online craft manufacturing stores like Etsy provide the outlet for makers to market and sell the products (Tierney, 2015).

Artisan's Asylum is a nonprofit makerspace in Somerville, Massachusetts, established in 2010 by robot engineer Gui Cavalcanti and costume designer Jenn Martinez. The founders wanted to create a more affordable space for people with different talents and abilities to collaborate and access the fabrication tools and equipment necessary to make their envisioned products. Cavalcanti and Martinez chose Somerville, with the second highest number of artists per capita in the United States after Manhattan, in which to locate the studio. The fabrication center began in a 9,000 square foot facility with low-rent workspaces for 80 artisans. It is now located in a 40,000 square foot former envelope factory with more than 150 studio spaces and is one of the largest makerspaces on the East Coast. As of mid-2014, there were more than 400 active members.

Individuals can buy memberships to use 3-D printers, drill presses, and other industrial equipment in numerous shop facilities such as woodworking, welding, jewelry/metalsmithing, screen printing, electronics, and robotics. Membership includes access to shared work areas and equipment as well as invitations to speaking events, workshops, and product demos. Before using the equipment, certification is required, gained from either on-site training or previous experience. Artisan's Asylum offers training classes such as Introduction to Fermentation Workshop for beer making, Arts Marketing for Artists & Makers, Introduction to 3-D Modeling, Introduction to Leatherworking, CNC Plasma Cutter 101, and many more.

Individual makers at Artisan's Asylum can access funding to use the space in various ways. Crowdfunding has been a key approach to fund technological and design projects, and to date, Artisan's Asylum members have raised $4 million on

Kickstarter for such projects. In addition, $3.5 million in venture capital has been offered to start-ups (Kalish, 2014). Artisan's Asylum also offers seasonal grants to applicants with innovative project ideas to cover all membership and storage space costs and some course fees. One recent recipient got funding to fabricate toys for special needs children; another learned coloring techniques for steel. Companies ranging from new start-ups to well-established corporations can also become Asylum "Corporate Associates" if they sponsor their employees to explore, work, and create in the makerspace and benefit from private team training.

These company partnerships as well as space, equipment, and training courses accessible at a low cost have broken down barriers to local creativity and design in Somerville. Thanks to makerspaces like these around the country, manufacturing equipment previously located exclusively in large companies behind closed doors is now accessible to the public. In general, communities have taken advantage of these new opportunities and spaces to learn and grow. Since the foundation of Artisan's Asylum, for instance, the space has been home to 40 to 50 small manufacturing enterprises and manufacturing in Somerville has increased by 50% (Pierce, 2013). The maker movement is generating a new source of innovation and entrepreneurial activity to local economies. In doing so, it is adding diversification, a basic principle of local economic development planning. Further, it provides the possibility for the community to benefit from the scaling up and ultimately exporting of products from the most successful makers.

PLED PROBLEM SOLVING 10.1
Employment Planning as Economic Development

How does an older Northeastern city with a declining industrial base, high unemployment, uncoordinated federal economic programs, and a reputation for poor service in job training and placement overcome its handicaps and use its federal resources to build a job training and referral system that draws industry back into town, creates jobs, and wins the respect of private industry?

In Eastport, which has come a fair way toward achieving these goals, the answer rests in a combination of the city's commitment to provide real job service to the private sector and its determination to save neighborhoods by seeing that there are jobs for the people who live in them. Indeed, the key to the economic turnaround of Eastport is jobs—especially new jobs in the heart of the city to replace those lost. The blueprint for achieving this is Eastport's Employment Development

(Continued)

(Continued)

Plan, with a realistic approach to urban planning and a coordinated use of federal funds. The plan's principal goal is creating jobs and assuring people's access to them.

The essence of the Eastport Plan is the coordination of the efforts of all the federal urban economic stimulus programs into one local agency used to build a base for both short- and long-term improvements in the city's economy. Federal funding for public works, economic development, and training and employment had been coming into the city under separate programs. The plan provides a means to combine these programs at the local level. Its goal is to create 14,000 new permanent jobs over 5 years.

The city of Eastport had some successful experience in downtown revitalization to draw on in putting together the plan. The city had already faced all the problems of many older cities—a declining inner-city tax base, movement of the middle class to the suburbs, increased demands for social services by those remaining, and a growing unemployment problem. As one response to its problems, the city chose to make a direct investment in the downtown waterfront, transforming this decaying and obsolete commercial area into a housing, commercial, and tourist center that has attracted national interest. The success of the downtown revitalization effort demonstrated to residents that the city could be made livable again. The city proposed to revitalize several neighborhoods. Residents, who had seen the downtown successfully restored, had reason to hope that the new plan might work in their neighborhoods.

One of the first steps the city took was to reorganize the city's various employment and economic development activities into a single agency, the Employment and Economic Policy Administration (EEPA), and to give it responsibility for providing new or expanding industries in the area with trained workers or federal job training program enrollees whom a firm could train.

Before the city could undertake job training and referral services for the private sector, it had a major handicap to overcome—its reputation for providing poor-quality employment services to those industries. Private employers felt that the city had provided inadequate job orientation services to the potential workers it referred. Many trainees had dropped out of the program in which they were placed, or the employers were so dissatisfied with them that they did not go back to the program for more. There were few links between the city employment program and the community organizations that understood the special needs of the cultural and ethnic groups living in the inner city, from which many of the prospective workers were drawn. Private employers felt that the city did not give a high priority to the services it provided.

The EEPA set out to correct this situation. The city sponsored a survey of employers to find out what specific problems they had experienced in the past and asked for their advice on how to improve the situation. One problem frequently identified was a lack of direct involvement on the part of the city officials in dealing with private-sector industry. To correct this, the city first transferred on-the-job training activities from the independent agency that had been acting for the city to

the EEPA. The EEPA then formed a coalition with the National Association of Business (NAB) and the Urban League to provide the close contacts among the city, jobs, and people, which were lacking before.

Later, the on-the-job training program of the EEPA formally merged with the NAB. The two agencies are now housed together, with each agency maintaining its own role in the employment process. The NAB staff aggressively approached the business community to find jobs for the economically disadvantaged. Firms that agreed to participate could hire individuals directly or through an on-the-job training program. The payoff to the firms is the screening, job orientation, and employability counseling provided to each person by the city agency before the initial employment.

One illustrative program is a training program underway to provide long-range training opportunities in the marine and computer fields. The harbor is the site of a major new industrial park that will provide jobs for 3,500 skilled and unskilled workers. Using a variety of funding sources, the city renovated and equipped one of the buildings in the park to serve as a job training center—the only vocational training facility directly linking the growing marine industry with a skills training program.

The center's staff identified specific highly skilled occupations that required no more than 10 months of training. They then verified the need for workers with these skills with the firms operating the Marine Industrial Park. Under the agreements entered into between a potential employer and the center, each employer must appoint a training supervisor to assist in the design of the training programs. Each of the participating firms must use the plan developed as the basis of the agreement with the job training center. The job trainees are trained either at the center or on the job site. All employers using the center's services must make a commitment to hire first the individuals trained through the center program. This has not been a problem, because the agreements provide for heavy employer involvement in the specification and design of the training courses in all skill trades with known labor shortages.

Eastport seems to be well on its way to a healthier job base than it has had in some time. But there is more to the plan than the link between jobs and economic development, although that is a key element. Through the strengthening of the city's economic base and by providing jobs to unemployed city residents, the city's leaders believe they will reduce the problems of crime, poor housing, inadequate health facilities, and inaccessible recreational facilities.

One of the most exciting features of the plan is the one providing unemployed workers with loans to start their own businesses. Under this program, the unemployed continue to receive their unemployment insurance payments for a full year with a supplemental payment while they start their new business. Participants must take up to 6 weeks of small business training before they open a business and become involved in the SCORE (Service Corps of Retired Executives) program for technical assistance to their new firm. The program has received a lot of criticism from local merchants who claim that their firms were not subsidized at the outset and these new businesses represent unfair competition. On the other hand, the

(Continued)

(Continued)

program guidelines are relatively strict on the new firm competition area by restricting new start-up firms to business types not represented in the local community. What do you think of the complaints of the local businesspersons, and how might their issues be resolved if at all?

PLED PROBLEM SOLVING 10.2
Young Need a Job—Make Your Own!

Tung Ng was offered a job as a Vietnamese youth director by the Viet Family Life Center but wasn't sure if the ideas he had for the job would be acceptable to the organizers of the Viet Family Life Committee. That was 2 years ago, and Ng now draws $4,000 a month for work that has become a mission.

Ng's idea for the largely Vietnamese and Cambodian lower-income Crestview Park neighborhood was a program that would teach youngsters aged 14 to 21 about business, personal money management, and entrepreneurial savvy. Ng brought a lot of business know-how with him from Vietnam. He had worked for the U.S. Air Force in the Base Exchange. His family ran restaurants and variety stores in Saigon. He felt that the American born and raised Vietnamese and Cambodian youth were using their entrepreneurial skills to form gangs instead of starting their own businesses.

Ng started his program, called Youth Action, with only 20 youngsters. Based at a local center, the program is open to any child in the community. Only about 30% of its members belong to the Viet Family Life Center. Ng admitted Youth Action has many components similar to Junior Achievement. However, Youth Action is more professional because it is geared to help young people actually own and operate businesses in their communities. It also differs from standard job training programs because it doesn't teach them how to do a particular task in someone else's business. Youth Action shows youths how to develop "minibusinesses" of their own. They learn by attending a 10-week training program after school and on weekends. They also act as interns in jobs they can accommodate year round, after school, and on weekends.

At the conclusion of the training program, each youth has a business plan. These plans are screened by a panel of local Asian businesspeople. Those that meet the test of business worthiness are seed-funded with a grant of $4,000 and a small loan. The business must be in community-related areas and fit a community need. The youth cannot merely find a nice white-collar occupation outside the community as the answer to their problem.

"We live in a world where even many white-collar jobs in big and smaller companies are becoming scarce for experienced, educated adults," Ng pointed out.

"Asian youngsters must be trained early to turn their talents and skills into jobs they create for themselves."

The basis for Youth Action, said Ng, is "working to re-create historic values of building something for yourself and fostering a self-dignity, independence, and pride essential to long-term achievement." Ng hopes to expand the program if it continues to be successful.

The Family Life Center provides facilities for Youth Action activities but takes no money from them. All the money Youth Action generates is used to support its projects and for the youngsters' salaries. Members must give 15% of their earnings back to Youth Action. These funds are held in a trust account for each member's future education at the college or vocational level. A person who does not go to college forfeits his or her accumulation.

Since the program began, the teenagers have launched a prospering catering business, a computer training center, a web design service, a graphics business, a summer tutorial program for elementary school children, and an answering service. In addition to those ongoing services, Youth Action has sponsored several one-time projects such as yard sales, breakfasts, bake sales, and an ice cream store day (they made the ice cream at a local outlet and sold it). In the planning stages are a babysitting service, a Vietnamese and Cambodian book fair to encourage cultural restoration among inner-city youngsters, and a children's computer and electronic swap meet. To encourage sound money management, members must plan a personal budget and establish a savings account at the Korean-owned Community Savings and Loan Association. That bank was chosen, Ng noted, because he wants the youngsters to get in the habit of supporting local Asian business.

"The bank officers know them so well now that they've gone a long way toward establishing a sound relationship with a bank," said Ng. "I explained to them how important that will be when they're [old enough] to apply for credit and need good references."

Ng said, "I've found that most of these kids have lots of talent. They all have things they can do. If I say I need a sign made, or whatever, someone will say 'I can do it,' and they do it."

The adult board of Youth Action wants to consolidate all businesses under a single corporate or limited partnership status. The rationale for this move is that the business license and other procedures are too complicated and make business start-up more difficult than business operations. Several board members counter that this is the essence of the experience. Ng objects to this change. The cost of opening these ventures is time consuming and creates a liability for the Family Life Board. Assume the board has come to you as an economic development expert and asked you to chart an alternative plan for the youth businesses that is less expensive and reaches more youth.

Conclusion

We noted at the beginning of the chapter that human resource development incorporates workforce development and education. While workforce development has been a traditional focus in economic development, it has often operated as essentially a parallel system, and the two systems did not coordinate effectively. Consequently, the outcomes for economic development and workforce development were insufficient to promote sustainable local economic development (SLED). Education is also a critical factor to both systems' success. Quality education at the kindergarten through high school level provides the foundation for potential workers to receive training and to acquire additional certifications and education. Employers may reject locations that do not offer quality K–12 education because they don't think they will be able to secure the quality of workers they desire, or they won't be able to attract advanced employees to their location because such highly sought after workers seek quality schools for their children.

Horn et al. (2015) observed that "workers and employers . . . face new realities and uncertainties that current public policies and programs were not designed to address" (p. 1). For the practice of local economic development to advance, it will be critical for the education, workforce development, and economic development systems to work closely together.

Community Economic Development

The difference between community development and economic development is often a source of confusion, especially for new students of local economic development planning. The confusion can be cleared up by noting that *community* development focuses on a broad range of development issues that include housing, business and job development, health and safety, and child development as well as education and other critical public services. Business and job development can readily be identified as components of the economic side of community development. However, it is important to understand the spatial scale at which the economic aspects of community development are addressed. As Ferguson and Dickens (1999) noted, "No one argues that community development can effectively counteract the business cycle or fend off major transformation in the macroeconomy. Neither can it compete with income-transfer programs as short-run responses to poverty" (p. 2).

Community economic development focuses on the neighborhood scale of socioeconomic transformation in a distressed locality. Community economic development seeks to improve conditions within a geographic area that is populated by the disadvantaged and unable to control its socioeconomic direction or resources, both human and physical. The development efforts focusing on improving internal conditions within the neighborhood may very well need to focus on strengthening linkages external to the neighborhood. Strengthening those linkages often entails the economic side

of community development by linking neighborhood residents to opportunities for work outside of their neighborhood as well as by attracting new investment and businesses (and therefore jobs) to the neighborhood.

Fundamentally, *community economic* development has a narrower focus within the broader community development sector that is aimed at improving conditions and overall quality of life in poor and working-class neighborhoods. William H. Simon (2001) has defined *community economic development* as engaging in "(1) efforts to develop housing, jobs or business opportunities for low-income people, (2) in which a leading role is played by nonprofit, nongovernmental organizations, (3) that are accountable to residentially defined communities" (p. 4).

He also has noted that the community economic development movement has spawned significant legal and institutional innovations. These include the use of peripheral legal forms such as charitable corporations and cooperatives (Simon, 2001). Further, one of the most significant innovations was the passage of the Community Reinvestment Act (CRA), which requires banks to demonstrate lending and business development in disadvantaged communities.

The community economic development movement has grown more sophisticated in recent years. For example, the Center for Community Economic Development (CCED) is part of a national network of organizations creating local-level Families for Economic Security (FES) projects. According to CCED (2008), the FES project is as follows:

> Broad-based coalition comprised of legislators, advocates, direct service providers and foundations who support policies that build economic security for families, elders, and the communities in which they live. We define economic security as having enough money to cover the basics like rent, food, child care, health care, transportation, and taxes, and enough money to develop savings and assets. Savings and assets are what allow people to weather the inevitable economic ups and downs of life, and to build a more stable future. CFES [Californians for Family Economic Security] advocates that policymakers use more realistic measures of what it takes to make ends meet as they develop policies and allocate limited resources.

Efforts such as that of CCED have proliferated over the past several years due to the failure of the general economy to serve the needs of particularly disadvantaged communities. These development initiatives aim to generate *socially useful,* and *labor-intensive* projects that meet their expenses or make a profit while improving the employability of the participants. They also seek to create greater local control and ownership in a community. Parzen and Kieschnick (1992) observed the following:

> Ownership is integral to the notion of economic development. It has become commonplace to describe economic development by citing the old parable that you can feed someone for a day by giving them fish, or you can feed someone for life by teaching them to fish. This may be true. But the twentieth century postscript to the story is that what really matters is who owns the pond with the fish. There is surely a difference between two communities, one with all of its tangible assets owned by distant investors and one with a significant degree of local ownership. The absence of local ownership implies either a lack of local capital or a lack of confidence in local investing on the part of local owners of capital—neither is consistent with a policy of economic development. (p. 5)

The basic objective of these initiatives is to teach people at the neighborhood level to own their own pond and to fish it. This is accomplished by the following:

- Generating employment for particular segments of a disadvantaged community
- Capturing local or neighborhood spending to build local wealth
- Inspiring self-help and cooperative group-oriented (social capital) assistance
- Operating programs such as health, education, and nutrition for the public benefit
- Providing an alternative or intermediate sector to create jobs in the local economy
- Promoting democratic management and local ownership and control of enterprises

Nearly all of the activities discussed elsewhere in this book can be undertaken as community economic development initiatives. Around two decades ago, Teitz (1989) warned those who espoused neighborhood or community economic development:

> Neighborhoods, by their very nature, are problematic as a target of economic development strategy, in so far as a strategy is intended to generate economic activity and employment directly within their boundaries. As the places where people live and work, neighborhoods reflect most clearly the conditions of life of their residents. Thus, they are a logical focus of advocacy and political mobilization. But the historic divorce of workplace from residents is now so far advanced in

ECONOMIC DEVELOPMENTS 11.1
Brownfield Redevelopment Principles to Prevent Neighborhood Gentrification

Most older and poor neighborhoods have brownfield properties that are especially difficult to redevelop because they have known or expected environmental contamination. Prior to being redeveloped, these properties have to undergo assessment and cleanup of the environmental contamination, which increases their cost of redevelopment. There has been a range of public efforts at the national, state, and local levels to foster the cleanup and redevelopment of brownfields, whether in poor or prosperous neighborhoods. However, since these efforts began in the mid-1990s, the main brownfield redevelopment focus in both the public and private sectors has been on the most marketable and larger properties that are well located (i.e., not in the poorest neighborhoods). The rationale for the public-sector focus has been to maximize return on public investment, while the private sector logically and appropriately has sought to maximize profits.

The remaining brownfield inventory is increasingly composed of small and medium-sized sites, many of which would be considered marginal redevelopment prospects by the private sector due to their locations, limited end uses, and profit potentials. But neglecting their redevelopment stigmatizes and devalues surrounding nonbrownfield properties and acts as a barrier to neighborhood revitalization. The neighborhoods in which they are located are left further behind those being revitalized due to a proactive redevelopment climate catalyzed by major public initiatives such as the U.S. Environmental Protection Agency (EPA) Brownfields Revitalization Act as well as "back to the city" and urban sprawl containment (or smart growth) strategies. Thus, there is increasing concern over how brownfield redevelopment practices can contribute to growing urban income inequality and displacement of low-income residents from gentrification. The four principles that are discussed next are proposed to ensure brownfield redevelopment policy and public funding do not help foster these undesirable trends:*

1. Focus on brownfields in neighborhoods with the worst health exposure and greatest need for economic development.
2. Require demographic and economic impact assessments of projects as well as displacement projections and prevention/redress plans.
3. Emphasize a neighborhood approach in any provision for communitywide multipurpose grants for use for both assessment and cleanup on multiple sites.
4. Encourage the development of workforce housing on appropriate brownfield sites.

Following these principles may seem especially daunting with the lingering effects of the Great Recession's devastating impacts on the real estate market. However, the urban real estate market is exhibiting strong signs of recovery in major U.S. cities. Thus, brownfields in the poorest neighborhoods may be experiencing gentrification pressures or continue to be overlooked, contributing to greater inequality within cities as a result. One potential resource to counter this is the U.S. EPA "Brownfields Area-Wide Planning (BF AWP) Program," which began in 2010 as a planning approach to community brownfield challenges in recognition "that revitalization of the area surrounding the brownfield site(s) is critical to the successful reuse of the property as assessment, cleanup, and redevelopment of an individual site" (U.S. EPA, n.d.).

*See Leigh, Nancey Green. Testimony regarding "Revitalization of the Environmental Protection Agency's Brownfields Program." U.S. House of Representatives Committee on Transportation and Infrastructure, Subcommittee on Water Resources and Environment, February 14, 2008.

American cities that localized economic development efforts face great difficulties. (p. 112)

Fortunately, the tide is beginning to turn for the exodus of jobs and businesses from central cities across the nation. Over the last decade, there has been a "back to the downtown" movement occurring in our major cities, due to the rejection of suburban living by certain demographic groups (e.g., aging baby boomers, young professionals) as well as firms seeking to avoid the costs of urban sprawl (Birch, 2005). This *could* be a very positive trend for neighborhood revitalization and community economic development efforts. However, there are legitimate and growing concerns over how this back to the downtown movement contributes to growing income inequality and displacement of low-income residents due to gentrification. Thus, this major socioeconomic trend has the potential to overcome some of the inherent barriers to neighborhood or community economic development that Teitz (1989) identified by bringing economic activity back to central cities. However, unless the tools of community economic development can effectively be brought to bear on this new trend, the neighborhoods that were the focus of community economic development efforts may look and work much better for their new residents, but their efforts will have failed to improve the standard of living for the original disadvantaged residents. See Economic Developments 11.1 for community economic development principles that can guide neighborhood revitalization when brownfields are present.

Table 11.1 Comparison of Organizational Forms of Community-Based Economic and Employment Development

Organizational	Objectives	Methods
Community development corporation (CDC)	Build community-level institutions	Community organization and business formation
Community cooperative	Community/worker producer control	Collective business
Local enterprise agency (LEA)	Unemployed/community business formation	Local resource mobilization
Employee/worker ownership	Worker control	Worker finance
Community employment and training board	Human resource development	Training
LEED for Neighborhood Development (LEED-ND)	Mixed-income communities	Development projects

This chapter will focus on organizational form and objectives rather than specific activities of community economic development. We focus on six organizational forms: (1) community development corporations (CDCs), (2) community cooperatives, (3) local enterprise agencies (LEAs), (4) employee/worker ownerships, (5) community employment and training boards, and (6) Leadership in Energy and Environmental Design (LEED) for Neighborhood Development, or LEED-ND. The sixth organizational form can be distinguished from the other five forms because of its spatial orientation. They are compared in Table 11.1.

Community Development Corporations

The CDC is an institutional form pioneered in the United States that has attracted the interest of European governments.

CDCs were conceived as part of the War on Poverty in 1966, when Congress authorized a demonstration program as an amendment to the Economic Opportunity Act. The legislation was vague, however, and the concept was still just beginning to take shape when the first CDCs started to receive federal funding in 1968. The early years of the CDC movement included a number of forays into ghetto development. Some basic principles

that still guide community-based economic development were formulated then—community control, a comprehensive approach, a focus on business and economic development—but at that time no one knew how to apply them. Those early years also saw a number of failures, but even so, CDCs began to take hold.

They have gradually made the sometimes subtle transition from antipoverty agencies to economic development institutions. Their management and investment strategies have become more sophisticated. CDCs have expanded their resources not so much through the original War on Poverty program or the later (now defunct) Community Services Administration as through other development programs, primarily in the federal government. To illustrate these changes, early CDCs concerned with community-control issues usually started and managed day-care centers, employment and training, and housing assistance as in-house enterprises.

Few early CDCs considered investing in start-up businesses and few CDCs now manage their own ventures (examples are real estate development and technical assistance efforts). Instead, CDCs tended to take minority equity and debt positions in proven (although often young) firms with experienced management. And although CDCs still select projects in response to community priorities, they do so within the constraints of market feasibility. CDC investments are risky, but in general they have become more successful with smaller investments. As a corollary to this trend, CDCs now work much more closely with the private sector—particularly small businesses and the financial community. Joint ventures with entrepreneurs, housing development syndications, and bank credit lines are now common CDC features.

The U.S. Senate Committee on Health, Education, Labor, and Pensions, in assessing the effectiveness of various ways of delivering federal job training programs, concluded that community-based agencies performed exceptionally well as economic institutions. Avis Vidal of the Community Development Research Center at the New School in New York provided a detailed assessment of CDCs in 1995. At the time of her study in 1995, CDCs had produced more than 435,000 units of urban housing and 115,000 rural housing units since 1980 and acted to stabilize many of the nation's most seriously distressed neighborhoods by promoting and financing home and business ownership. Moreover, CDCs were considered cost effective, which encouraged the Ford Foundation to create the Local Initiatives Support Corporation (LISC). LISC has produced several hundred million dollars in real estate and economic development activity nationwide by leveraging public and private development dollars.

A long-term and comprehensive approach to development requires an institution that can develop and sustain a consistent but flexible strategy. CDCs are such organizations, and they provide full-time professional staffs and at least some planning capacity. Although some CDCs may rely heavily on community volunteers for help, most of their projects require professional and technical skills. The CDC staff must be competent enough to develop housing and businesses in distressed communities avoided by the private sector. This formidable task requires full-time energetic professionals. CDCs usually have in-house planning capacity to deal with the land-use and zoning issues as well as long-term land assembly and affordable housing development. Good CDCs develop strategies that are coordinated, comprehensive, feasible, and responsive to community needs. Such sophisticated planning allows CDCs to go head-to-head with better-financed organizations.

Institutional Advantages of Community Development Corporations

Given the difficulty of developing low-income areas, the notion that community-based organizations have been able to succeed where others have failed or simply stayed away may seem difficult to accept. After all, where there is a market, it should be adequately filled.

CDCs succeed because they consolidate issues and organize capital to deal with market failures in low-income areas. That is, CDCs reestablish the economic and social structure of low-income areas. Banks and other institutions try to work on the economic issues but may not take social barriers into consideration. Vidal (1992) concluded that CDCs "make a major impact on the problems of poor neighborhoods" (p. 19). The financial success of a CDC project is due to sensitivity to both political and business practices. This necessarily demands a comprehensive and coordinated strategy, incorporating social, economic, and physical planning. Because of their purpose, structure, and approach to economic development, CDCs combine characteristics that make them unique institutions. They do the following:

- Use private development techniques for public purposes
- Target benefits to communities and individuals in need
- Mobilize local initiatives to address local priorities
- Take a long-term approach to development
- Link planning to implementation
- Link complementary projects within a comprehensive strategy
- Understand and work with the processes of both the public and the private sectors

- Have legal authority to attract both public and private resources in a variety of roles
- Work directly with small businesses
- Reinvest resources in the community
- Use incentives to operate programs efficiently
- Transfer capacity among program activities

These characteristics are not, of course, limited to CDCs. Other institutions, including local governments, often perform some of these functions. Moreover, not all CDCs have the capacity to do all these things well. But CDCs are extremely flexible institutions. They can complement the activities of other local participants, develop their capacity through the assistance of these other institutions, and take increasing responsibility for development. In most communities, this process can be cooperative rather than competitive.

A city government, for example, may be able to use its powers of eminent domain to assemble land and its bonding authority to attract private capital for development and then let a CDC develop and manage the project. In a rural employment training program, a local community college or the state's extension service might design a curriculum while a CDC identifies and screens possible trainees and then places them with employers after the training is finished. States can contribute to these local partnerships by identifying roles for different organizations and by supporting innovative arrangements.

Challenges for Community Economic Development

Community economic development in organizations has not enjoyed enormous success in this new era of finance. The best example of this transition is the downfall of the once powerful Eastside Community Investments (ECI) of Indianapolis, Indiana. ECI was the poster child of CDCs. In its heyday in the 1970s, it employed more than 100 people in a variety of community endeavors from housing to social services. ECI was a paragon of community activism and respect—one of the best examples of a CDC serving a distressed area of more than 28,000 residents. ECI had a housing corporation, a credit union, and health and community welfare services. It became a powerful community force, maintaining partnerships with Aetna Life and Casualty and Indiana National Bank with an available $1 million mortgage loan pool. As projects increased in size and offered opportunities to invest in housing and small business, ECI ran into a quagmire of financial red ink. In August 1997, ECI faltered and began to unravel (Johnson and Reingold, 2000).

Many CDCs were founded and organized for social, not economic development, purposes. As a result, their staff may not have the necessary skills for managing complex economic projects. They also lack the oversight capacity of a sophisticated board of directors knowledgeable in business ventures. The internal dynamics of community development institutions focus on social over tough business decisions. Community development organizations may place emphasis on increasing staff over increasing economic returns. Furthermore, the multiple funding sources with different reporting requirements make the finances of community development organizations complicated, as well as difficult to monitor. Finally, CDCs have no reserves or investment capital. As a result, any emergency can expose and unravel the entire fabric of the organization.

Community Reinvestment Programs

Community reinvestment is a social philosophy and a movement. Its aim is to replace capital that flows out of minority and disadvantaged communities by pressuring banks and other lending institutions to develop new lending practices for housing, businesses, and social institutions in low-income areas. The key to such reinvestment is the use of the CRA originally authorized in 1977, which states in part that regulated financial institutions "have a continuing and affirmative obligation to help meet the credit needs of local communities [in] which they are chartered . . . consistent with safe and sound operation of such institutions" (quoted in Squires, 1992, p. 11). In 1994, to further address credit scarcity in poor communities, the Community Development Banking and Financial Institutions Act was passed. This provides for grants, loans, equity capital, and technical assistance to community development financial institutions (CDFIs).

Thus, community reinvestment straddles an ideological dilemma of finding good loans in impoverished neighborhoods. Proponents of this movement have helped to devise a number of coalitions across the nation designed to identify neighborhood goods, such as housing, and match them with qualified minority or community-based institutional borrowers. The community reinvestment movement has had some impact on reducing redlining and other adverse lending practices by major financial institutions. For example, it has spawned a new finance industry that seeks low-income lending opportunities and has gained enormous impetus with the tightening of the community reinvestment legislation in 1997. Banks seeking mergers must show that the mergers will not do harm to low-income areas and show a record of low-income community investments. As a result, more capital is seeking low-income opportunities than is available for the banks.

However, even its strongest proponents acknowledge that good investment opportunities able to meet the test of the law are difficult to identify. Moreover, enormous racism and selectivity remain in lending practices in the financial community. One response to the lack of community-based financing in minority communities has been the emphasis on the creation of nontraditional lending institutions such as community credit unions. Another answer to this dilemma is the development of CDFIs. Some CDFIs operate like traditional retail banks while others are community development organizations or credit unions that provide business-, home-, or other forms of asset-backed lending. The major difference between CDFIs and other lenders is that they are actually involved with their borrowers. They provide technical assistance and identify other lending sources, such as government funds, to enhance the borrowers' opportunities for success.

Community Cooperatives

Until recently, cooperative ownership was largely restricted to primary industry. But interest has grown in this form because of its labor-intensive character and its democratic management potential. Further, the themes of community economic development "have a distinct affinity with the cooperative form" (Simon, 2001, p. 130). The primary foci of community cooperatives in the United States are job creation, housing, and credit.

Cooperatives are owned by their membership. According to the University of Wisconsin Center for Cooperatives (www.uwcc.wisc.edu), cooperatives have seven internationally recognized principles as the basis for doing business:

1. Voluntary and open membership
2. Democratic member control
3. Members' economic participation
4. Autonomy and independence
5. Education, training, and information sharing
6. Cooperation among cooperatives
7. Concern for community

Several general situations give rise to the formation of community cooperatives, including the following:

- When a business owner wishes to sell to a community group in order to continue serving the community

- When a community service such as child care, elder care, or other care requires delivery
- When a group of skilled people who are underemployed or unemployed form an organization to sell their services collectively for community benefit

In each case, the steps for forming a cooperative are the same. First, a feasibility study needs to be conducted to ensure that the activity has real potential for success within a cooperative framework. Second, the organizational structure should be well thought out. Ownership shares, leadership, and similar matters need careful early discussion. Although there may be early enthusiasm for cooperative forms, this may quickly subside when people understand the system's rules. Finally, intensive training needs to be given to help the participants adapt to the new system.

Cooperatives require business plans as well as feasibility studies. Such work should at least provide answers to questions on the following topics:

Product Specification

- What evidence is there that a market exists for the product or service to be provided by the business?
- Are there similar products on the market or services available? If so, is their local business, with which you will be competing, offering the same product or service?

Workers

- Are the workers sufficiently trained in cooperative management?
- Is there a real balance of skills among the workforce? Cooperatives will not work if there are differential skill levels.

Premises, Equipment, and Materials

- Are there low-cost premises available for the initial start-up?
- What transportation cost will be incurred in operating the venture?
- What are the sources of supply? Are they all under the cooperative's control? For example, is the cooperative selling products made by members or community groups?
- Can the cooperative obtain the necessary credit and access to capital to operate the facility?

Management Skills

Are there sufficient management skills in the group to provide for the following?

- Designing the product or service
- Organizing the production or distribution
- Handling the banking and finance
- Marketing

The cooperative is a recognized legal form, and in most states it has to be incorporated under the appropriate state statute to engage in business. Most states have statutes specifically governing cooperatives. Cooperatives can take advantage of a variety of public and private support, which includes favorable federal tax treatment, as well as access to credit from the National Cooperative Bank (Simon, 2001).

Local Enterprise Agencies

LEAs are organizations dedicated to the creation of employment through the support and development of indigenous local enterprises, providing an intermediary link between public and private institutions and the community. They function primarily by facilitating access to capital and technical or professional assistance. LEAs are usually formed by a coalition of local business unions and government, along with community-based organizations. They facilitate nonprofit distribution that may or may not set up profit-making subsidiaries.

The primary functions of LEAs are to do the following:

- Provide extensive advice and services for small business entrepreneurs through a permanent organization
- Provide complementary services that assist new businesses to get started by securing finance and technical assistance
- Build confidence in the total community by forming new networks of professionals and grassroots groups
- Improve local marketing capacity of new firms or existing firms

Employee/Worker Ownerships

Employee/worker ownerships are a recent phenomenon. They are a potential response to pending firm closures. Workers and community groups

become interested in assessing whether the companies can succeed if they are taken over by the workers. Not all company closures are due to failing business. Sometimes a company can be part of a larger portfolio of a diversified corporation that has realigned its strategic focus and the company does not fit with the new perspective. There are several legal structures that may be explored in this type of project. The two better-known examples are employee stock ownership plans (ESOPs) and worker cooperatives.

Employee Stock Ownership Plans

ESOPs allow a company to establish a trust in order for it to be purchased. The trust acts as fiduciary agent for the firm's purchase using stock issued to the employees. Employees purchase shares through a combination of wage reductions, actual cash, and borrowing. Over the years of the plan, employees acquire vesting rights to their stock. All stock owned by an employee is resold to the company in the event that the employee leaves the firm or retires. The steps for forming an ESOP are as follows:

1. An employee corporation is formed.
2. The trust is formed and an ownership plan drafted.
3. ESOP borrows capital for equity contributions and operating capital.
4. Financial requirements are determined for the purchase of shares and to build equity accounts.
5. A debt service plan is organized.
6. The employee management structure is established.

State and federal laws govern the technical aspects of stock issues and trusts. These technicalities require close study by attorneys and other professionals because there are many potential pitfalls. Most ESOPs are likely to be in closely held rather than publicly held companies and provide an average of 10% to 40% of total company stock and limited voting rights, but the plans can be used to create majority employee-owned, democratically structured companies (Rosen, 1989, p. 258).

Worker Cooperatives

In worker cooperatives, the employees remain employees as such but are joint owners of the enterprise. Shares are issued to all of the employees, and these are reinvested for the firm's growth and development. Allocation of income at the end of the year is determined by weighted votes of employees,

usually based on years of service. That is, an employee with 3 years of service has more votes than a new employee.

A worker cooperative differs from a conventional business, however, in that membership rights are personal rights, assigned to the people working in the company because they work there. In other words, the workers' voting and profit rights can never be bought. In a conventional business, by contrast, membership rights are transferable property rights attached to the shares of stock. The shares may be sold to any person who has the cash to buy them, and the person need not be connected with the business.

In worker cooperatives, the workers are the owners. The division of duties and responsibilities in such a system must be considered carefully. Not all employees may bring equal skills or talents to the firm. As a result, serious ruptures may occur in the democratic management process. Some members of the worker cooperative may not end up with a meaningful say in how firm development is carried out in their name. For this reason, staff development requires continual consideration.

Leadership in Energy and Environmental Design for Neighborhood Development

LEED-ND is a program created by the U.S. Green Building Council (USGBC). It extends the focus on creating green buildings that was the original motivation for the council's establishment. USGBC created the LEED system to foster a more sustainable built environment by providing "building owners and operators with a framework for identifying and implementing practical and measurable green building design, construction, operations and maintenance solutions" (USGBC, 2012). USGBC developed a rating system that measures how a building's location, construction, and operating systems can lower costs, reduce waste going to landfills, reduce greenhouse gas (GHG) emissions, conserve energy and water, and increase the health and safety of its occupants. Buildings receive ratings ranging from silver to platinum based on the extent to which they achieve the criterion. The LEED system has different metrics for new construction versus existing building retrofitting.

Prior to the creation of LEED-ND, the LEED system influenced developers to build or redevelop in a more sustainable way that benefited the building owners (in reduced operation costs and other financial impacts) and the building's occupants. LEED-rated buildings could appear in community neighborhoods needing new development, but their relationship to the neighborhood was not a consideration. Their presence could add to gentrification, the jobs–housing imbalance, or traffic and carbon emissions. The LEED-ND system creates higher expectations for the impacts of buildings

and multiple building projects, specifically for their impacts on the surrounding community. It encourages building projects that protect and enhance health, the environment, and quality of life. The rating system defines the criteria for which points are given for projects that protect and enhance the overall health, natural environment, and quality of life in a community. It promotes the location and design of neighborhoods that reduce vehicle miles traveled (VMT) and create jobs and services that are accessible by foot or public transit.

In its rating system, LEED-ND specifies points for projects that create mixed-income communities. It specifically states its goal is "to promote socially equitable and engaging communities by enabling residents from a wide range of economic levels, household sizes, and age groups to live in a community" (USGBC, 2012). While the way in which it seeks to create mixed-income communities is limited to requiring the building of housing for different income levels, this provision has the potential to make a significant contribution to community economic development through the provision of affordable housing in combination with its goal to reduce jobs–housing imbalances. LEED-ND is a notable effort that seeks to transform private development and was conceived by a private–public partnership of multiple organizations (see Figure 11.1).

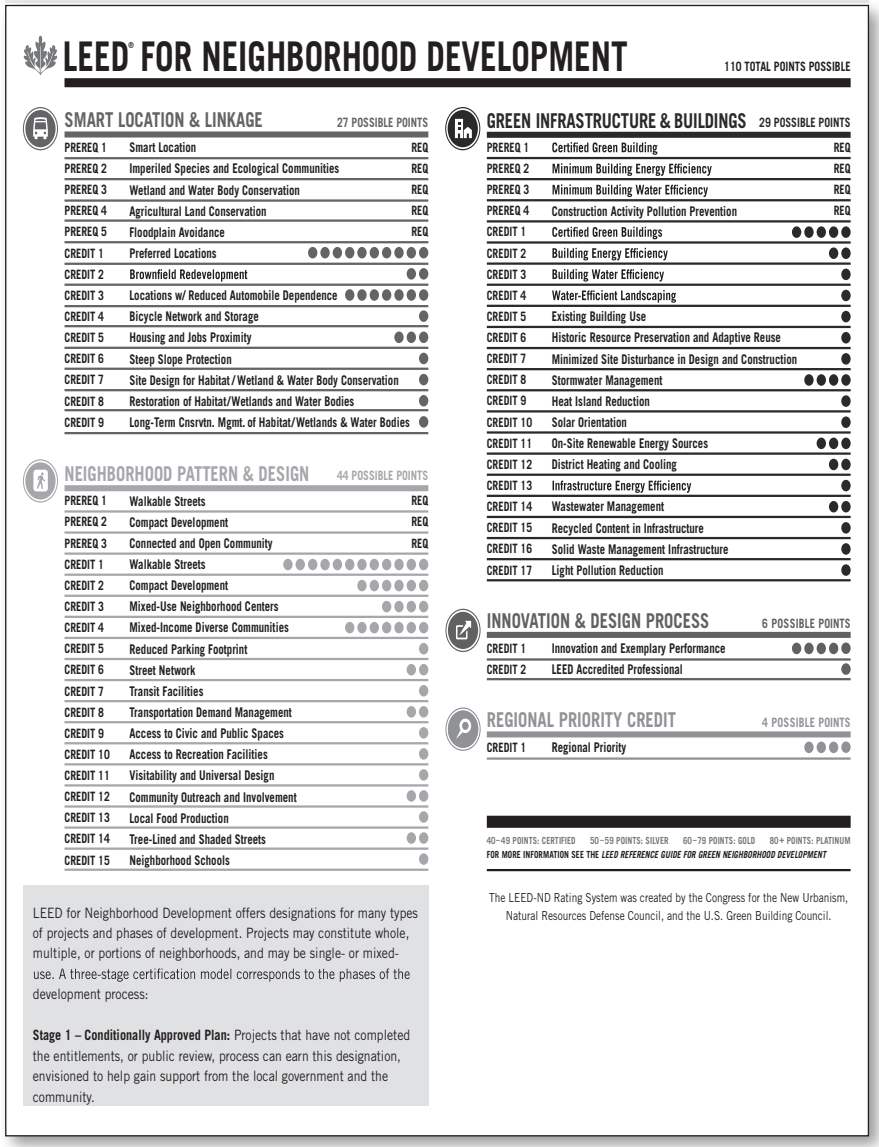
Targeting and Marketing Neighborhood/ Community Assets

Marketing a community is very much like marketing a product. Product and market research are employed to determine what type of assets a community has to offer, in what markets, and to what type(s) of clients. For maximum effectiveness, the community should be marketed only after determining the likely buyers of its resources—for example, tourism, where purchasers may be domestic or foreign. A community should develop knowledge of its marketing audience: What do they read? What appeals to them? How can they be reached? These questions are even more appropriate in industrial or commercial economic development. The market depends on who the community is trying to reach. This is true for individual projects, attraction efforts, and financial assistance for local projects. The fundamentals of target marketing are relatively straightforward. These are listed next.

Identification of the Community's Long-Term Goals

The level of long-term growth must be gauged with respect to overall population and/or jobs that a community is targeting. For example, to

Figure 11.1 LEED for Neighborhood Development



Sources: USGBC (2012).

produce a job growth of 3% per year, an international audience may be the most likely target audience. Smaller, growing firms, however, may be more appropriate for a community that prefers more limited or controlled development.

A balance among different segments of industrial, commercial, and community-based activities may be desired as well. This balance determines what types of marketing efforts are undertaken and how vigorously they are pursued. In addition, knowledge of the existing infrastructure will influence the development alternatives examined. In fact, it may be impossible to select certain targets without a long-range infrastructure plan.

One of the best examples of how a community has organized and projected its resource base is the emergence of Emeryville, California, as the nation's premiere biotechnology center. Emeryville, with a population of around 10,000, accomplished this by concentrating its infrastructure development on the requirements of the new biotech industries.

Marketing of the Community

Any marketing of the community must depict it as it is and the genuine opportunities it presents. Glossy brochures and rhetoric will not help market a community. Major manufacturing firms have their own in-house research staff, so they are not deceived by false advertising. Dissemination of misleading information will seriously damage an area's reputation.

The type of communication selected must appeal to the community's potential clients. If the prospective clients are Japanese businesses, information in one of the Japanese newspapers or magazines will reach this client base better than brochures written in English and hand-carried by the local mayor or community leader to the Japanese consulate.

Scientific or trade journals may be an even more important source for businesses than brochures or similar public relations efforts. If you want to get the attention of firms' managers, do it through the reading material of the senior executives. Whereas CEOs may read the *Wall Street Journal, The Economist,* or the *New York Times,* they seldom read brochures.

It is important to know the industry being recruited. Neighborhood or community leaders need to know some general details about the type of firm likely to visit the community. Many industrialists or would-be entrepreneurs have been discouraged by the seeming lack of interest in, or shallow responses of community leaders to questions regarding the industry and its requirements.

Manufacturing firms are not the only focus of community and neighborhood marketing and recruiting efforts. Many communities feel that to be competitive and perceived as offering a high quality of life, they need to offer strong services in the form of retail and health care businesses. For example, communities that have been overlooked by some of the major retail chains have developed specific recruitment efforts aimed at them. They may also target the recruitment of medical and health care professionals.

Incentives and Community Benefits Agreements

Incentives should be packaged to meet the needs of the firm or individual entrepreneur a community is trying to attract or encourage in the area. Financial incentives are seldom as important as a good business climate, strong retail potential, available research facilities, appropriate space at reasonable rates, adequate infrastructure, and a proactive local government with a flexible approach to incentives.

A community should list available assistance and resources as well as location information. Communities often publish promotional material with no information on who to contact for further details. As a result, they have missed sales simply because of poor communication. The entire community needs to be involved in promotion. (There are many stories about uncooperative staff giving a negative impression to visitors in casual conversations.)

At the same time, business being recruited to a community, or even just looking for a location to land, has come to see the offering of incentives as the norm rather than the exception. Many communities have found out the hard way that the incentives offered do not always warrant the benefits gained from the new business. The level of jobs promised may never materialize, or the jobs go to employees brought with the firm rather than to those in need in the community. The burden on existing infrastructure—water, energy, and transportation—may degrade levels of service for the rest of the community. In recent years, the use of community benefits agreements (CBAs) has begun to proliferate. These are legally binding contracts negotiated by the community with the new business that can spell out who gets the jobs created, who pays for infrastructure, and other contributions the new business or development may make to improve the overall community.

The Community Prospectus: A Means of Communicating the Qualities of Your Community

Many communities invest in general promotional brochures. Although these may be helpful, they seldom attract a firm. Because targeted marketing requires establishing the specific feature identification required by an industry or certain type of firm, the best means of communicating to firms is through the community prospectus. This material acts much like a firm prospectus and allows the buyer to know what the community is offering and what opportunities are available.

The prospectus should describe the community assets and business opportunities in terms of industrial and market potentials as well as community trends over the past few years and expected future trends in commercial and

industrial opportunities. It should also relate any national economic or social trends that may affect a venture's potential in the community. Moreover, it should include a section on the community's research and development (R&D) capacity, infrastructure plan, and financial assistance program.

The R&D capacity section is one of the most important components of any community prospectus. Access to higher education institutions, research laboratories, or facilities offering scientific knowledge and/or trained personnel is vital to almost all industries. It is important to describe the nature and extent of the scientific efforts in the area that relate to business, industrial, or agricultural products and services.

In addition, other private sector research or advanced facilities or equipment should be described as well as any major products, scientific breakthroughs, or well-known researchers resident in the area. Of course, very few communities have such resources within their boundaries, and most communities would benefit from projects that improve their R&D capacity in defined areas that complement their development strategies.

The *community infrastructure plan* section of the community prospectus should discuss the community physical infrastructure—location and buildings—along with specialized equipment and personnel (other than management) available to prospective businesses. It should describe what the community's industrial or retail or commercial space availability is in terms of specific venture requirements. For this to be effective, suitable building sites should already have been located and fully developed. If a site has been selected, describe it and how it meets the venture's needs, the businesses surrounding the site, whether the site and any buildings on it will be bought or leased, and the reasons behind these decisions.

The infrastructure discussion will cover slightly different topics, depending on whether the venture is manufacturing, retail, or service. Existing plans should be examined for the targeted businesses. Infrastructure descriptions for both retail and manufacturing should list the availability of water, power, and waste removal as well as any environmental constraints and existing transportation systems. Telecommunications is an especially important infrastructure component and needs to be assessed carefully. Today, optic cable, international switching, and data-transmission facilities such as teleports are as important as water and sewerage capacity. Manufacturing discussions should also address the availability of industrial space at reasonable rates and whether facilities are available on a short- or long-term basis.

The description of human resource availability should include what kind of labor can be obtained locally for the type of venture sought. This section should also discuss the executive and managerial skills available in the area, as well as the general labor supply. If training is required, there needs to be a discussion on how it will occur and the associated costs.

The *financial program* section of the community prospectus is the last section because it is based on the information in the earlier sections. It should offer plans to improve the critical gaps in the community infrastructure as well as offer specific financial assistance for the desired type of firm. This section should, of course, make note of the financial programs available; these include initial financial assistance, venture capital, debt financing, and other specialized funding. Additional community funding or special arrangements for access to local capital should also be described.

Local Government's Role in Community Economic Development

Local governments can take an active role in stimulating and supporting community economic development by doing the following (see Economic Developments 11.2):

- Developing revolving loan funds and similar financing as seed capital for community projects
- Examining means to subcontract to community groups the delivery of community services or the operation of community facilities
- Developing work spaces and facilities for community groups to commence enterprise activities
- Identifying surplus or underutilized local government equipment that might be used by community groups
- Establishing a network of people or service clubs that can provide technical assistance to community groups
- Making community-based initiatives a component of the overall local economic development strategy
- Helping communities negotiate CBAs

Conclusion

As we stated at the start of this chapter, community economic development focuses on the neighborhood scale of socioeconomic transformation in a distressed locality. The need for effective community economic development became even more acute due to the devastation the subprime mortgage crisis wreaked on neighborhoods throughout the United States. Local economic developers are called upon to improve the capacity for these smaller geographic areas and their populations to withstand the buffeting of national and international economic trends as well as local restructuring.

ECONOMIC DEVELOPMENTS 11.2
East Gateway District: Bridging the Gap Between Community and Economic Development

The East Gateway District is a neighborhood in coastal city Clearwater, Florida, located 30 miles west of Tampa. As seen in Figure 11.2, the neighborhood has 2,871 residents, or 2.6% of the city's population. East Gateway has a diverse population that is half White, one third Hispanic, and a little less than one quarter Black. Median household income is low at $31,038, and about half of the residents are employed. East Gateway lies in Pinellas County, which is known for its high concentrations of poverty. According to the 2012 Economic Impact of Poverty Report by the Pinellas County Board of County Commissioners, 11.6% of county residents live at or below the federal poverty level. The county's poverty rate costs an estimated $2.5 billion annually for funding for jails, hospitals, homeless populations, and lost wages due to high school dropouts (Warren, 2013). The county and city of Clearwater recognized that rather than reacting to the consequences of high poverty rates, investing resources into poverty prevention through quality education, stable employment, affordable housing, and accessible health care would be more socially cost effective over time, according to Geri Campos Lopez, director of economic development and housing for the city of Clearwater (2016).

Figure 11.2 East Gateway District and Extended Study Area Markets

East Gateway Community	Extended Study Area
MARKET SIZE	**MARKET SIZE**
Population: 2,871	Population: 11,703
Households: 1,219	Households: 4,669
MARKET BUYING POWER	**MARKET BUYING POWER**
Median Household Income: $31,098	Median Household Income: $39,417
Average Household Income: $41,115	Average Household Income: $46,019
Aggregate Income: $50,119,618	Aggregate Income: $214,860,000
Income per Acre: $205,501	Income per Acre: $133,678
Income of New Home Buyers (2009): $41,231	Income of New Home Buyers (2009): $46,280

Throughout the early 2000s, economic development in Clearwater primarily focused on redevelopment of the downtown and shoreline areas. The Economic

(Continued)

(Continued)

Development and Housing Department and the Community Redevelopment Agency (CRA) wanted to reprioritize funding and attention toward targeted neighborhood improvement, one of which was the East Gateway District. The city and CRA sought to address neighborhood issues of crime and safety, run-down appearance, weak business environment, economic growth and housing, and the need to integrate the Hispanic community. Outreach efforts were stymied by a lack of funding, low private sector involvement, the Hispanic residents' language and cultural barriers as well as general distrust of government. In 2008, the East Gateway District Task Force, made up of city staff from multiple departments, formed a Five-Year Action Program aimed at engaging residents and business interests, revitalizing to increase economic stability and private property reinvestment, and establishing a greater neighborhood pride and identity. The action program identified funding sources for projects, formed a steering committee, and developed regional partnerships (City of Clearwater, Florida, n.d.; Lopez, 2016).

The Five-Year Action Program has generated a number of revitalization accomplishments. The CRA Facade and Building Lot Improvement Program, seen in Figure 11.3, offers loans or grants to commercial property owners to improve the appearance of building exteriors. The Sidewalk Improvement Program is focused on identifying streets lacking pedestrian pathways and adding sidewalks to make neighborhoods more walkable. There has been strategic property acquisition and development of derelict property. The site of a previous rundown Economy Inn Motel is now a 15,000 square foot community garden (Leone, 2015). Funding has been allocated for increased police presence in the district. Finally, the incorporation of multicultural celebrations into the action program has increased involvement of residents and businesses in the revitalization process. Both the East Gateway Hispanic Festival and the Mexican Independence Day events have helped the task force to gain residents' trust of government efforts (Lopez, 2016).

Figure 11.3 Facade and Building Lot Improvement Program

Source: Lopez (2016).

The East Gateway District Task Force has identified several lessons for economic developers working to address similar neighborhood issues. Forming

partnerships, such as with the CareerSource Pinellas workforce board, the Mexican consulate, and the Hispanic Outreach Center, creates a more inclusive and holistic approach to economic development in the district. By gaining resident trust through these partnerships and various social events, the task force and partnering organizations were able to be more effective in outreach to address the needs of citizens. The task force successfully implemented programs by layering funding sources, such as Community Development Block Grants (CDBGs) for the facade program, tax increment financing (TIF) for community policing and land acquisition, a County Health Department grant for a farmers market, and a capital improvement program called "Penny for Pinellas" for infrastructure improvements (Lopez, 2016).

Following the implementation of the Five-Year Action Program, the CRA hired a firm to conduct a neighborhood market/economic analysis to define the financial basis for market-supportable revitalization efforts (Gensler and Social Compact, 2012). With this analysis, the city and CRA were able to tailor programs to the area's strengths and build on its existing assets. The study determined that the district has a population density twice that of both an extended study area and the entire city. Even though median household income was 27% lower in the East Gateway District than the extended study area in Clearwater, income per acre was actually 54% higher. East Gateway is also home to many entrepreneurs and small businesses: 81% of the 201 businesses have five or fewer employees. The concentrated population and income of neighborhood residents as well as the numerous wealth-generating microbusinesses generate a higher-than-average buying power in the district.

The amount of retail, grocers, and restaurants in the district, however, lags far behind neighboring districts in Clearwater. The analysis addressed this "under retailing" by recommending more mixed-use development and small businesses, such as local, unique apparel shops to fill potential retail space in walkable areas that could attract the rising number of visitors to the Clearwater area (Gensler and Social Compact, 2012). In its latest effort, the East Gateway Task Force is investigating the potential of developing a *mercado* (Spanish for *market*), a mixed-use building to house local vendors focused on the Hispanic market as well as a microbusiness incubator, commercial kitchen, and tourism-oriented attractions and retail (Lopez, 2016).

Clearwater's Department of Economic Development and Housing and other city agencies are proactively focused on reducing poverty and its associated high public costs through economic and community development. With careful analyses of economic and demographic characteristics and engagement of the East Gateway neighborhood, they were able to identify strategic initiatives for redevelopment. Applying inclusive collaboration and trust building since the beginning, East Gateway District's revitalization efforts started small and are slowly building to become a model for longer-term sustainable development.

Acknowledgments: The authors gratefully acknowledge Geri Campos Lopez for bringing this important case study to their attention and also the research assistance of Ashley Bozarth, Georgia Tech City and Regional Planning master's student.

PLED PROBLEM SOLVING 11.1
Workers as Owners

On a late autumn evening in northeast Franklin, a bookkeeper and a couple of stock clerks could be seen through the plate glass windows of the ComUNITY Sports store. For everyone else, work had ended. But for ComUNITY Sports' directors and stockholders, sitting on empty running shoe boxes and sports equipment crates, the day had only just begun. The president, Joe Offer, called the meeting to order, and soon the group was engrossed in a spirited debate on product mix. Some people advocated cutting the price of ski equipment early in order to stimulate sales in all of the city's ComUNITY Sports outlets. This had been a very successful tactic of the old management. Several people objected to this proposal simply because it was the old management's idea. "Who wants to be associated with management that was forced into near bankruptcy on a nationwide sporting goods chain?" Another hot topic was corporate directors' liability. Both topics were being pursued in heated debate.

At this point, Jim Schader, then board secretary, spoke up. "Dun & Bradstreet's asking for details on our financial status," he said. "What's our policy on giving out this type of data to investment services?"

No policy existed, but there were plenty of opinions both on the point and at some distance from the actual task at hand. When no consensus was forthcoming, Offer finally expressed what turned out to be the majority view. "Our credit's good," he said, "and we will provide it because it will be good for us to cooperate early in order to get the best credit rating possible when we need it. We are directors and the only stockholders of the company."

And an unusual company it is. Until last year, the store in which this meeting was held and 10 others in the city of Franklin were combined with a chain of more than 200 discount sporting goods stores. The company had prospered in the 1980s when discount consumerism was rampant, but the whole chain was in danger of collapsing by the time the employees made an offer to take over the entire West Coast division of the company and break it up into smaller city-based retail outlets separately managed by the workers at each store but under an umbrella corporate structure. Today, the ComUNITY Sports stores claim that weekly sales are 20% above those of other retail clothing and equipment chains; the Roslyn store sales are up 40%.

"It's *our* store," said Faith Mason, ski sales manager for all of the ComUNITY Sports stores. "We all feel that way about it. Owning the company gives us more incentive to make it a success. We're putting in about 80 hours a week—40 as workers, 40 as owners. And guess what? I actually *enjoy* coming to work. There will be more store systems like this one. It's a great program and too good an idea not to spread."

Yet support for employee ownership was not universal at the time it was proposed. In Franklin, for example, Cornell Young, a labor leader, encountered criticism

when he first explored worker ownership a few years ago. "An executive at ComUNITY once told me it sounded like socialism to him," Young said. "But I said we just wanted to organize stores the way he and his friends had originally started back in the late '60s when they were radicals at Berkeley—everybody pays into a kitty, you elect some directors, you hire a manager. What's socialistic about that; that's exactly what they did before they joined the country club set."

Young has served for years as president of Local 357 of the United Retail Sales Union (URSU). The membership of Local 357 peaked at about 9,000 in the mid-1970s, after which the depressed economy forced a string of sporting goods retail stores to close, which cost the union more than a quarter of its members. The crowning blow was when Pacific Tex, the conglomerate that spun off ComUNITY as part of its profit center in 1977, decided in 1981 and 1982 to shut down 14 of its West Coast–area stores, idling nearly 400 URSU workers as well as members of a smaller textile union. The Pacific Tex had closed more than 150 stores in 8 years—65% of its nationwide chain—and its losses in 1981 exceeded $30 million.

In many respects, it is a unique and unprecedented agreement. Workers obtain ownership of a segment of the company and the right to buy in the future as well as more authority and responsibility. It provides an avenue to learn management skills and provides a legal property claim—a right of first refusal to purchase stores from the company, so it cannot be bid up competitively and sold off to someone else. This arrangement creates an important source of worker-controlled capital—perhaps as much as $1.5 million a year at first, with more as time goes on—to finance incentives and investments in employee-owned enterprises.

Pacific Tex officials acknowledge that their main interest was and is in the stores they kept, not the ones they gave up. Without making judgments on the sales potential of the stores, they do characterize them as "experimental." According to one company official, the agreement reflects "a sharing of objectives with the union. U.S. business and communities have to find ways of working together and stop fighting with one another; that's the only way we can be internationally competitive."

Even while this experiment is underway, the directors of ComUNITY need to consider diversifying beyond sporting goods into men's and women's clothing lines imported from China. Since the union has gone on record as "Buy America," this is not an easy decision. But if a move is not made soon, the managers fear the ComUNITY experiment will disappear forever. This is a tough issue. The employer/owners feel that selling foreign goods will hurt local workers.

The board doesn't know how to raise this issue with the membership or the impact of failing to compete in a global marketing system.

The board has called you and your team as consultants, and they want your advice on how to keep their experiment going.

PLED PROBLEM SOLVING 11.2
A Community Finds a Business

Lakes Alternative Energy Board (LAEB), a community development corporation (CDC), is composed of three community action agencies (CAAs) involved in alternative sources of energy. This partnership will simultaneously bring in revenue to the community, create jobs, and provide low-cost fuel to area residents.

LAEB serves the Lakes area, which is known for its high unemployment rate and high percentages of elderly residents and families with incomes below the poverty line. The area has been hit severely by the collapse of the two traditional sources of employment and revenue: the iron mines and the lumber industry. Fuel is also a primary concern in the region, with its 120-inch annual snowfall and temperatures below freezing for two months of the year. Fuel costs are high: many of the Lakes' elderly clients spend about half their income on fuel.

The first venture is the use of wood pellets as a fuel source, which will eventually lead to the building of a wood-pellet-processing plant in one of the nine counties served by the four agencies. This mutually beneficial venture illustrates how CAAs can turn their nonmonetary assets into an effective base for the creation of community economic development projects.

Another project was to have been the construction of live-in demonstration models of energy-efficient houses: retrofitting existing housing, developing wood-based insulation materials, and producing low-cost stoves. At the time, though, the energy crunch was not a hot topic and the proposal was turned down.

LAEB has been incorporated by the three CAAs. It is investigating new, alternative energy sources with economic development potential.

The goals of LAEB included analyzing the use of wood refuse and small streams on farm property as an alternative fuel source, especially for low-income people; promoting the use of alternative fuel sources; and creating—and keeping—jobs in the wood industry through the private sector. The intent is to develop a low-cost fuel that can be used by both commercial and residential energy systems.

LAEB has stressed to Lakes residents that it is not in competition with the private sector; rather, it sees its function as a catalyst for local economic development. LAEB staff members define their role as helping private entrepreneurs get established in the alternative energy market. Possible spin-off ventures include maintaining storage facilities for bulk quantities of pellets, manufacturing the special stoves needed to burn the pellets, and running local dealerships to sell and service the stoves. LAEB also wants to establish a market for wood refuse that would generate income for loggers, truckers, and the struggling wood-processing plants in the area.

LAEB is attempting to involve all sectors of the community in its efforts. Representatives from the three CAAs sit on the board, along with representatives from the lumber industry, local universities, the U.S. Forest Service, and cooperative extension services in each county as well as low-income people from the area.

There are also a number of technical advisory groups and committees set up to bring in authorities on various aspects of the lumber industry.

Once LAEB established its board and narrowed its focus to the development of wood pellets, it turned its attention to finding a private partner with the necessary experience to establish a pellet plant. Asperal, Inc., a wood pellet manufacturer in Minnesota, approached LAEB when it heard that the board had capital to lend to a private partner in exchange for establishing a pellet plant.

LAEB evaluated the quality of Asperal's pellets and its collateral and then negotiated a loan agreement with the company. In exchange for a low-interest loan, Asperal will work to establish a market for wood pellets in the Upper Peninsula. If successful, Asperal will begin building a pellet plant in one of the nine counties covered by LAEB.

Capitalizing on their status as nonprofit entities and their access to federal funds, the three CAAs in LAEB used a government grant to cement a public–private partnership with Asperal. As the private partner, Asperal, Inc., benefits from the agencies' contacts in and knowledge of various sectors of their communities in gaining the support and cooperation of area residents. LAEB gains the business experience and technical knowledge of the private firm that will help ensure the venture's success.

The question before LAEB is what its next venture should be. The current energy crisis is over, and pellet sales will lag soon. How can all the energy and expertise be directed to creating jobs in the future?

PLED PROBLEM SOLVING 11.3
New Freedom House

New Freedom House was founded to set up a Native American jewelry distribution center on the Napahmoe Reservation in a state located in the southwestern United States. It markets products for four American Indian cooperatives—three that produce leathercrafts and one that makes garments. The cooperatives were the first ones established by the National Center for Native American Enterprise (NCNAE).

The initial distribution business via national sales catalog did well. People responded favorably to the products (design and quality), and the Christmas season brought substantial sales. After the holidays, however, sales slowed considerably. Freedom House responded by entering the walk-in retail business in Santa Fe, while continuing as a mail-order operation. The business also bought raw materials for all the worker cooperatives, many of which had been buying their supplies at excessive prices or were simply unable to purchase supplies in their local areas.

(Continued)

(Continued)

It was then, too, that NCNAE decided to turn over ownership of New Freedom House to the reservation tribes who supplied it with its merchandise and those who worked in the various cooperatives. The resulting cooperative would market goods for individual craft co-ops, buy their supplies, and have as members all those who worked in established cooperatives.

New Freedom House Cooperative (NFHC) is a two-tiered organization. The first consists of the "unit members," or unincorporated associations of individuals organized on a cooperative basis who are engaged in the production and sale of handcrafted products. There are 13 unit members in the southwestern region, including jewelry, several leather co-ops, a clothing co-op, and a candle co-op. Each unit member is entitled to elect one representative (usually its president) to the NFHC board of directors. The board elects officers who, in turn, employ professional managers and a staff to operate the main office and warehouse.

Each unit member (workshop) is a separate entity, but all are organized on identical lines and their individual members sign identical articles of association. Any person may become a member of an association at any time by subscribing to its articles and paying dues. The members elect officers who function as a management committee. The number of partners ranges from 6 to approximately 25.

The bylaws and marketing agreement signed by each unit member are the two basic governing instruments describing the various responsibilities of the members and the directors and officers.

Each worker's co-op (unit member) is responsible for the production of particular items in the product line described in the New Freedom House catalog. These products include suede handbags, leather belts, cuff links, costume jewelry, dolls, stuffed animals and toys, children's clothing, canvas bags, candles, greeting cards, and numerous other items. Each workshop, moreover, is responsible for maintaining its own records of its total production and that of individual members. Every 2 weeks, an employee from the main office of New Freedom House collects the finished products and delivers raw materials and equipment that unit members have ordered.

Partial payment in the form of an advance is made for the products on the basis of a cost price that includes labor costs, costs of material, and overhead items for each unit member. The advance is distributed to workers on the basis of their weekly production.

After being collected from individual workshops, products are taken to the New Freedom House warehouse, where each item is tagged and inventoried by quality control personnel. Any item not conforming to established standards is tagged for return to the particular workshop. After clearing quality control, all of the products in a particular category are pooled and placed in storage bins or on racks for distribution through retail outlets or mail-order sales on a national level. Proceeds from mail-order sales account for most Freedom House income. Mail-order catalogs are distributed to an extensive mailing list throughout the United States, Canada, and England. This list is constantly augmented by trading with other organizations and by leasing lists from direct mail brokerage services.

NCNAE has organized several urban-based organizations, including six retail outlets plus Graphic Arts Southwest, Southwest Media, and Flute Publications. The latter are affiliated as craft workshops—that is, the publications and media workers are members of the NCNAE. Although their activities are conducted in an urban setting, their activities are directly related to the needs of the rural members.

New Freedom House has faced the future squarely, and the prospects are not good. The organization is large and too decentralized to compete with the better-capitalized mail-order firms tied in with the credit card companies. But New Freedom House has both a mission and a message. The board is now struggling with a proposal from a large New York mail-order firm to take over management and distribution of its products. Board President Chief Joseph reminded his fellow board members that neither the Anglos nor any other minorities were there when they needed them in the early days. Young Susan Windfall, another board member, said the chief's ideas are tired and racist. She believes it is time for Native Americans to show the way—and make big profits. Who is right? How would you go about setting up an agreement with an external retailer to work with the Native American community? Or would you reject the idea altogether and redesign the firm? If the latter decision were made, what would you do?

Community-based economic development and employment initiatives are important elements in a wider local economic development strategy. In general, these initiatives have strong social objectives underpinning economic ones. They are as much rooted in and motivated by needs (of groups, individuals, and localities) as they are in finding and exploiting economic opportunities. They offer a structure and resources to encourage economic activity at the neighborhood level. They provide access to job opportunities for local people who find entering the economic system difficult. (See Table 11.2 for a sampling of community-based employment development projects.)

Table 11.2 Community-Based Employment Development Project Idea Starters

Tool	Project Idea Starter
Employee/ ownership cooperatives	*Skilled trades cooperative:* A cooperative is formed of skilled people of various trades who offer advice on technical matters to local firms and provide a sales and repair service for all kinds of specialized equipment and machinery. *Worker acquisition of existing firm:* Industry workers agree to put up money of their own—and accept a "readjustment in their pay"—in a bid to save their jobs and buy a sizable share in their former employer's business through the formation of a new company owned jointly by workers and perhaps a state equity bank (e.g., metalworkers with the blessing of a union and the support of a new equity bank). *Cooperative government projects bidding service:* People with expertise in various aspects of fabrication come together as a cooperative to bid collectively for contracts (government and other) that they do not have the capacity to bid for as individuals.

(Continued)

(Continued)

Community-based employment	*A home-energy auditing and retrofitting scheme:* The aim is to provide an energy auditing and efficiency test service to homeowners and prospective buyers to estimate energy costs and to provide quotes on retrofitting to reduce costs. The project also might supply a team of people capable of carrying out retrofitting activities.
Community-based service and employment development	*Recycling of waste as art and craft materials:* This project is to collect and redistribute industrial and other waste as art and craft materials from a shop or center that may be used by anyone in the community who pays a yearly subscription or a set fee per garbage-bagful. Also, lessons might be provided in making art and crafts with recycled materials.

The track record of community-based economic and employment development organizations has not always been good. Some of the reasons for this have been an imbalance in the mix of social and economic objectives, inadequate financing, and lack of skills and planning. Another major problem relates to the fundamental issue of ownership and control. In theory, community-based organizations for economic development and employment generation are democratically owned and controlled. In practice, however, problems have occurred when these organizations commence projects on a business basis. Finally, as Michael Teitz (1989) warned, these problems are mentioned here not to undermine the concept but to state the limitations clearly.

Building the Implementation Plan

The successful implementation of any economic development plan is dependent upon three key elements: choosing the appropriate strategy, having the correct organizational structure, and garnering the necessary resources. The first element, choosing appropriate strategies, was the focus of Chapter 7 of this book. This chapter was followed by an exploration of common foci of economic development strategies: locality development (Chapter 8), business development (Chapter 9), and human resource development (Chapter 10). In Chapter 12, we focus upon creating the necessary organization structure and identifying and deploying the necessary resources for successful plan implementation. With few, if any, exceptions, the necessary organization structure will be made up of private and public partners. Consistently critical resources for economic development plan implementation are financing and marketing.

The initiation of economic development planning is fundamentally an effort to influence the market economy. Further, the impetus for this effort is always because there are acknowledged deficiencies in the outcomes that the market economy has generated for a community overall and/or for certain segments of that community. While the public sector is always involved—directly or indirectly—in economic development plan implementation, the point of any such plan is to strengthen the private sector and the benefits this will generate for all of the community. Thus, local economic development plan implementation is invariably a mixture of public and

private actions. For example, public provision of roads or mass transit and strong K–12 education systems are indirect but critical enablers for economic development. In response to market failures, the public sector needs to directly stimulate private capital formation and firm creation or location. In the next section, we discuss the use of public–private partnerships for implementing economic development plans or projects.

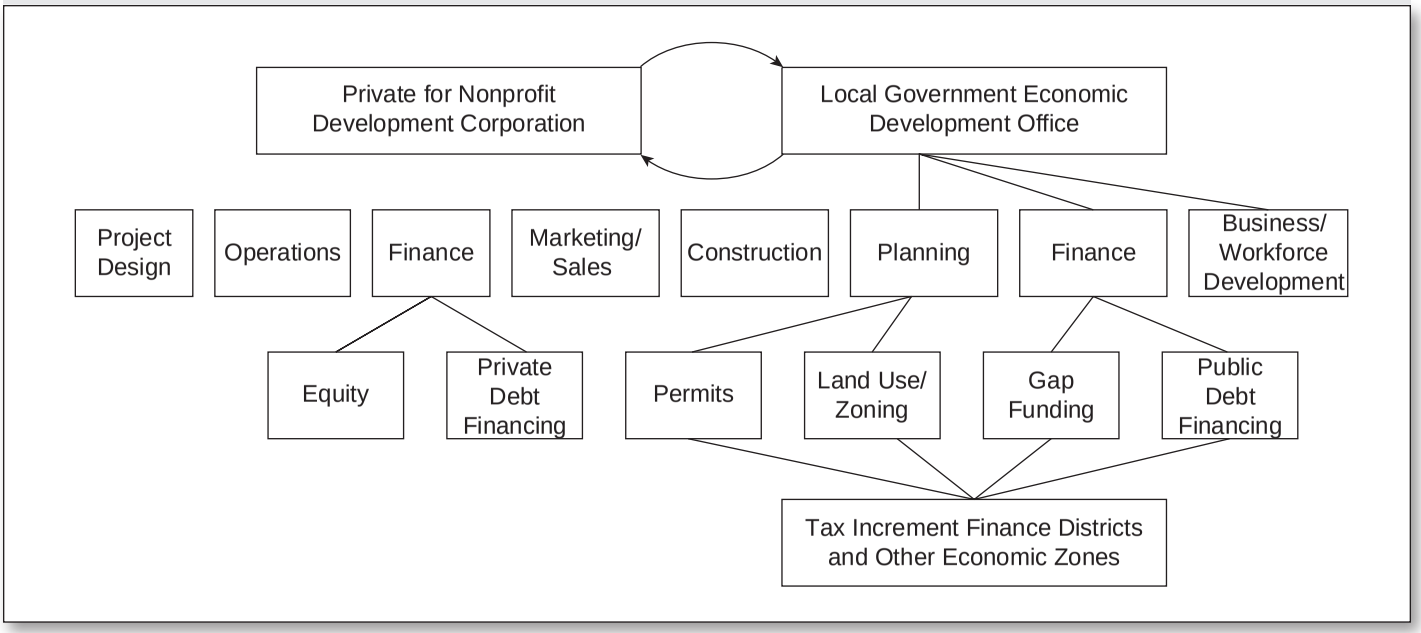
Public–Private Partnerships

Figure 12.1 is a stylized representation of public–private organizational relationships for plan or project implementation. The left side of the figure characterizes the public side of partnerships. It begins with a unit of local government (county or city level depending on the size of the area) responsible for economic development planning. The exact title of this unit varies across localities. Sometimes this entity is combined with a community development or other government department. Typically, the public economic development unit oversees planning, financing, and business and workforce development needs for strategic plans and specific projects. Some examples of public-sector activities it must engage in to realize plans and projects are creating land use and zoning supportive of economic development goals, identifying specific areas within the community that warrant designation as tax-increment finance districts or other types of economic zones because of their economic decline or underdevelopment, and providing an efficient permitting process for specific projects.

In one major city, Long Beach, California, the primary responsibility for economic development plan implementation falls to the Community Development Department through the Economic Development Bureau, along with the Workforce Development Bureau and the Redevelopment Agency. But the city recognizes the success of its economic development planning requires an integrated and coordinated effort that leverages resources of other city departments as well as external partners. The key city departments include Planning & Building, Financial Management, Public Works, and the public safety departments, fire and police (City of Long Beach Economic Development Bureau, 2007).

The right side of Figure 12.1 characterizes the private side of partnerships. Private partners can be in the for-profit or nonprofit sector. Included among for-profit–sector partners are trade and industry associations (e.g., chambers of commerce, a specific manufacturing association), banks, utilities, developers, and major locally headquartered companies. Nonprofit partners can include community development corporations (CDCs), medical

Figure 12.1 Organizational Relationships for Project or Plan Implementation



Source: Adapted by Nancey Green Leigh from Figure 3.3 in Giles (2011).

and educational institutions, and foundations, among others. When the focus is a specific project, private for-profit partners are looking for the best market opportunities, the highest and best use of land under consideration for development, and greatest profit-making opportunities.[1] Nonprofit partners typically are seeking to compensate for market failures and to address conditions in declining areas by taking on projects that are not in the best locations and for which high returns are not expected.

Public–private partnerships can be complex and require considerable effort to create and sustain. The basic premise behind public–private partnerships is that of cooperation for implementing a plan of benefit to the larger community or of risk sharing for developing a specific project. A public–private partnership example of a project is one that uses the assets of the public sector—for example, a building, air rights, a change in zoning, low-interest loans—combined with tax benefits for private enterprise, ranging from credits for hiring local workers to tax relief such as land or sales tax deductions.

For specific projects, the private sector provides the design and development capacity along with cash or equity for financing. An example of a project is a parking structure used by the public for a fee combined with a movie theater that might be incorporated into the base of the same building operated by a private firm. The profit or income is split between the public and private parties in a variety of ways.

When public–private partnerships are focused on implementing a broader plan rather than a specific project, partners from both sides are often called upon to help market the community or a plan or both.

Marketing Community

Traditionally, communities do marketing for economic development to highlight their attractiveness to new employers and investors. However, there is increasing recognition that communities need to retain businesses and residents that have contributed to the economy. Thus, marketing is also necessary to ensure that a successful business seeking to expand will do so in the community, and a resident who is retiring considers the quality of life of the community attractive enough to retire in place.

While much of community marketing activity has focused on tourism and visitor services, community marketing is becoming increasingly sophisticated in seeking to position local assets in the global economy. Community marketing in today's environment is based on an inventory of local resources (human, cultural, natural, and built), opportunities, and options. Combined,

these create a profile that helps the community determine the kinds of firms and institutions that "fit" best with its multidimensional resource base. Based on the profile, the community creates marketing messages for local and external consumption.

Communities have to develop a clear identity for their marketing to be successful. This identity needs to be authentic and capable of contributing to the base of the local economy. Over time, this identity may change in order to address long-term economic challenges the city has not been able to overcome as well as to take advantage of emerging opportunities in the economy. For example, it was noted in the city of Long Beach's economic development implementation plan that "Long Beach has shed its skin numerous times. It has been a resort town, an oil town, a Navy town, an aerospace town" (p. 2). Long Beach's stated goal was to become a more diversified city, less susceptible to large economic shifts (City of Long Beach Economic Development Bureau, 2007).

Components of Good Community Marketing Analysis and Designing a Marketing Plan

While each community has to develop interesting ways to present its assets, this presentation has to be based on real data for and indicators of the economic area that it represents. Typically, the local economy is part of a regional economic system or even a megaregion like Los Angeles, London, New York, or Shanghai, which requires setting the local economy (be it neighborhood, town, or city) within the larger regional context, even when local smaller-scale development is the goal. Next is a list of analysis steps that should be taken into consideration.

- *Market area context*. Determine what role the community has within the larger region and what resource(s) it contributes.
- *Local market capacity*. Determine the size of the local market area and its components with respect to demographic profile, met and unmet consumer demands, and product and service provision.
- *Resource assessment*. Conduct a meaningful assessment of the strength, weaknesses, and resource potential of the focus area or local economy.
- *Market scope and penetration*. Determine the degree to which the local economy offers the ability to meet some market demands using its locational and related assets.
- *Niche competitive advantage*. Because globalization has reduced the comparative advantages of location and even fixed natural-resource

assets, determine whether a combination of special attributes—cultural, social, educational, environmental, or equity performance that enhances community quality and stability—has the potential to create a marketing advantage for the local economy.
- *Cost factors*. Determine what the key cost considerations are for firms or projects expressing interest in the local area or for which the community wants to compete.
- *Sustainability*. Determine what hard and soft infrastructure support the community can supply to firms that are part of the green economy.

Community (City or Neighborhood) Marketing Plan

No matter whether it is a firm, organization, city, or neighborhood, if there is an intention to compete, then there is a need to market and present. Many people confuse marketing with sales. Sales are the best indicator of good marketing. But marketing is the envelope that helps introduce the place or product. Good marketing presents the place or product in such a way that the consumer recalls it for the intrinsic reasons of quality and reliability. In too many cases, however, places substitute slogans for genuine market assessment and presentation. A good motto confirms the quality or other aspects of the product or place, but it is not a substitute for providing the services of goods. In this respect, communities have to present what they have and not what they would like to have. So it is not convincing to present a nice poster with an ocean background and attractive man or woman in swimwear for a desert community. However, many communities make the equivalent of such poor choices. They present what they think the consumer or the local leaders want the place to be rather than what it really is. Places like Washington, D.C., can market themselves as "capital cities," but a small county seat would be foolish to use the same kind of presentation. Therefore, a city or community has to portray what is has and how it wants to position its attributes as the enabling factors for competing to serve, attract, or grow firms.

A basic checklist of requirements for designing a place-oriented marketing effort includes the following:

- *Identity*. Community has assessed its assets and come to a conclusion regarding the keys for its place identity—good transportation, strong universities, quality neighborhoods, specific firms, natural features or resources, and so forth.
- *Consolidated presentation*. The most successful communities have a consortium of partner organizations that present the community

through a coordinated, strategic message. These can include the following:
  - Site-selection consultants
  - Existing industry
  - Community stakeholders and leadership
  - State government
  - Legislative delegation
  - Greater-region development organizations
  - County commissioners
  - City council
  - Real estate community
  - Electric utility providers
  - Economic development organizations
  - Marketing mission and trade show contacts
- *Communications infrastructure*. Communities have a layered communications infrastructure that includes person-to-person, print, and various forms of electronic media. Competitive communities have well-designed Web presences that prospective firms or residents can explore. These include all pertinent information about the community and use a geographic information system (GIS) as well as video to describe the community. Competitive communities also explore additional ways to reach intended audiences such as holding conferences, seeking to place articles about the community in national and international media, and getting the city used as a set or backdrop for movies and television.

Economic Developments 12.1 lists the marketing actions the county of Lancaster, South Carolina, identified for its economic development plan implementation. Lancaster County is relatively rural but in the sphere of influence of Charlotte, North Carolina, and desired to create stronger economic development for itself.

Marketing can help to attract new business and residents to a community or retain residents and expand existing businesses. In many cases, however, communities find that it is necessary to help businesses and development projects obtain the financing they need to expand or locate to the community. This is most applicable when there is a market failure for the community or when the community is seeking to shift its economy to targeted growth sectors. The next sections present basic concepts of project financing that a serious student of economic development planning will explore further in classes on economic development finance.

ECONOMIC DEVELOPMENTS 12.1
Marketing Tools for Communicating a Community's Assets to the Marketplace

- After identifying target sectors, develop specific marketing materials for the sectors.
- Develop a business or industrial park brochure profiling all business park locations.
- Produce a transportation network flyer or promotional piece for all target sectors that includes pictures, maps, and quotes from existing companies.
- Develop existing industry testimonials.
- Develop an incentive (state and local) overview for business retention and new firm recruitment.
- Develop a list of all local "certified" rail-served sites.
- Create a community profile providing a general overview and utilizing regional demographics facts such as the following:
  - Education
  - Transportation
  - Labor force
  - Incentives
  - Utilities
  - Sites or buildings
  - Quality of life
  - Major employers
  - Cost of living
  - Target industries or sectors
- Develop a professionally bound package of information materials.
- Develop a retiree recruitment marketing piece.
- Create an economic development website that provides information on available incentives, community demographics, and available buildings and sites.

Source: Adapted from Lancaster County, South Carolina (2009).

Project Financing

Prior to securing the financing for an economic development project, the project idea must be determined to be viable within the environment it is designed to improve. Next, the project must be shaped to pass the viability test by building action plans specifying in some detail the project, outputs, resources, and support system requirements. For smaller, simpler, shorter-term projects, an action plan may itself be adequate to gain formal commitment for the project idea and thus claim materials, finance, and personnel to implement it.

As projects become larger, more complex, and longer term, however, action plans for the project design need to be fully detailed to claim resources. Detailed project plans are also required whenever a local government is considering acting on its own or if projects are submitted that invite local government endorsement.

The preparation of a detailed project plan has four traditional basic tasks (Items 1, 3, 4, and 5 on the following list) to which we add a fifth (Item 2). They are as follows:

1. Viability assessment
2. Sustainability assessment
3. Detailed feasibility studies
4. Organizational design and business plan preparation
5. Monitoring and evaluation program

The main difference between the detailed project plan and the formerly described action plan is the degree of detail required. In this chapter, we will concentrate on general standards for detailed project plans that can be adapted to any requirement.

Project Viability Assessment

Project development is the redefinition and determination of the potential of specific project ideas. During this stage, the decision must be made on whether to complete the planning phase and implement the project. In general, project development involves taking one or more attractive project ideas, shaping and specifying each precisely, and rejecting those that do not seem viable. To justify the project, the criterion of potential for economic development and employment has to be satisfied, at least preliminarily. In project development, viability is determined in relation to four interconnected bases: (1) community, (2) locational, (3) commercial, and (4) implementation (Malizia, 1985).

Community Viability

Because economic development is a community issue, the formulation and selection of local economic development projects constitute a communitywide political act. First, the local economic development process describes the necessary support base required to make a project viable. Then it decides whether the project has sufficient community support.

Caution is suggested when deciding whether a project has community viability. Many individuals and organizations may initially give casual support to project ideas but then withdraw their support when the project is likely to become a reality. To overcome this potential problem, local economic development planners should seek explicit oral commitments from other key actors. These informal commitments are required because to

proceed on any other basis is far too cumbersome. Formal commitments are sought only after the project is found to be viable, an action plan assembled, and important actors and their roles identified.

Locational Viability

For the locational/market viability analysis, the resources required by the project need to be identified and their availability determined. How the proposal harmonizes with other existing or proposed projects needs to be considered.

Next, planners should identify potential customers for the product or service provided by the project and answer the following questions: Who are they? Where are they located? Why would they buy this product? How frequently? Planners then need to step back and consider market size and trends. They should determine whether the product is in a growth industry, whether the market area is growing, and what the expected size of the market is when operations begin. The next step is analyzing the competition. What are the strengths and weaknesses of the product relative to the competition? What is the market capture strategy—that is, what will be done to gain customers?

The answers to the previously given questions will provide two valuable pieces of information: (1) whether to proceed any further with the project, and (2) what should be addressed in a formal market study and marketing plan by consultants at a later stage of the economic development process. If the project appears to pass the test of locational or market viability, its economic or financial and operational viability then need to be considered.

Commercial Viability

Based on the answers to the questions asked in the market viability analysis, the community or other sponsor must estimate the revenue-raising potential of the project and judge the likelihood of the project recovering its costs. Knowing the level of risk to capital is a precondition to determining whether investors will be readily available and whether the project will have reinvestment opportunities. The economic viability studies should consider each of these aspects. They constitute the initial pieces of a project cost plan to be made in the next step of the local economic development process.

Implementation Viability

Implementation viability is determined by considering who in the community has the skills and capacity to undertake the task. There is no real point in embarking on projects if the skills to organize or manage the project are not

present. In addition, the community has to consider how the services and goods are produced and the means of production, as well as whether the five *M*s (materials, [hu]man power, markets, management, and money) can be satisfied in developing and operating the project. On completion of this task, the financial feasibility must be determined before the project is undertaken.

Sustainability Assessment

Sustainability analysis of projects and firms is an evolving field. It can broadly be construed to focus on social and environmental issues. With respect to social issues, a community that is providing financial and other support to a private development or firm will want to know how workers will be treated: For example, will they receive fair compensation packages? Will safety standards and rights be adhered to? With respect to environmental issues, will the development or firm seek to minimize its carbon footprint and the waste it generates? Will it follow green building standards? And will the managers of a development or firm also expect its suppliers to adhere to sustainable social and environmental practices?

Detailed Feasibility Analysis

The purpose of the detailed feasibility analysis is to identify the critical issues affecting each project's potential for success, to specify what conditions or requirements are necessary, and to evaluate the possibility of achieving these requirements. The information previously gathered for the project viability analysis and the action plan forms the basis of the full-scale feasibility study. This study investigates in more depth any weaknesses identified in the earlier steps and does a more thorough analysis of each feasibility factor—especially the financial aspects. The research should result in an internal working document, which, in turn, forms the basis of the business plan. The business plan is a more formal document, designed for distribution outside the project planning committee. It incorporates much of the information in the feasibility study and also discusses how the conditions for success will be achieved vis-à-vis the operation of the business.

There is no standard format for a feasibility study, but there are a minimum of three special studies that should be undertaken:

1. Market analysis
2. Financial analysis
3. Cost–benefit analysis

These studies should be undertaken for project start-ups, business expansions and acquisitions, and community development projects. Research and evaluation methods may differ somewhat in each case, however. The scope of each study will depend on the size and complexity of the prospective venture. If any major problems or weaknesses are identified, they must be examined thoroughly, increasing the study's length and complexity. Although the precise nature of each of these analyses will differ according to the venture under investigation, certain factors should be addressed in each of them. These will be discussed next, and sources for gathering information will be given throughout.

Market Analysis

At earlier stages in the planning process, we looked briefly at the overall market for a project's potential products or services. We also roughly defined the project's potential customers and estimated their numbers based on general research. The market analysis component of the feasibility study is more specific and detailed. It defines the project's primary and secondary markets and determines the total size and share of the market that the venture can be expected to capture. To do this, the market analysis must closely examine three factors: (1) the project's product, (2) the total potential market, and (3) competition.

Products

The first step in assessing the feasibility of all possible projects is to specifically define the product or service, or the mixture of goods and services, that the activity or business will produce and/or sell. As discussed earlier, all other factors in the feasibility analysis will relate to this definition. If the venture will manufacture a product, this part of the analysis may include a technical study, covering such topics as the following:

1. Crucial technical specifications, such as design, durability, and standardization
2. Engineering requirements, such as equipment, tools, and work flow
3. Product development, such as laboratory and field test results or plans

If the community does not have the capacity either to pay for or to carry out a technical product analysis, the venture is not a feasible one for that organization. If the venture will sell but not manufacture the product—as in

retail or wholesale undertakings—the product analysis may consist of comparing products available to determine the type or model to be sold. At a minimum, the product or products to be sold should be described as specifically as possible.

Necessary or desirable location specifications may be part of this section for manufacturing, wholesale, and retail ventures. Site characteristics, such as proximity to raw material suppliers, customers, transportation, educational institutions, and other directly related resources, should be specified for manufacturing and wholesale projects. For retail ventures, store location is an important factor in the success of the business. The store location or possible locations will probably not be specified until the business plan is prepared. Retail store location will be addressed under market analysis, because location profoundly affects the market for most stores. For existing businesses, the feasibility study should review what its product and/or service has been. If any changes are to be made, these should be noted and explained.

Total Market

Having specified what products or services will be provided by the venture, the market analysis must answer the following two questions: (1) Who will buy the venture's product or service? (2) What are the characteristics of its potential customers? The answers to these questions will define the venture's primary market, which are those who will be its major purchasers or users, and its secondary markets—that is, its other potential customers. Trade journals and suppliers, community surveys, or surveys of local business may provide much of this information.

The geographic limitations on the venture's market must also be assessed. If it is a retail store, for example, it may be limited to a few blocks or the surrounding community. A manufacturing project may have a regional or perhaps even national market. Trade associations and other knowledgeable sources can help define the market area. Also, check with business schools, libraries, and the chamber of commerce.

Once the characteristics of potential customers and the geographic limitations have been outlined, the size of the total market can be estimated by determining how many people (or firms) with those characteristics are located within the specified geographic area. Population statistics (e.g., population census) and various business censuses (e.g., census of manufacturers) should be helpful sources for these figures. This information, along with the information gathered under the competition analysis, will allow the

community to determine how many buyers in the market will become customers (the market share). Suppliers, trade associations, the chamber of commerce, state and federal agencies, and other business owners in the area can assist in making these projections.

It is important to remember that many factors affect the size of the total market and the size of the market share that the venture can expect to capture. There are many factors beyond the control of the community (e.g., demography, economic conditions, and competition). On the other hand, items like price, product, product mix, and location are within their control. Location has already been discussed, concerning its influence on a venture's potential market. The price of goods or services is another important element over which the community has little control. Even though the price must have, as its base, the cost of providing the good or performing the service, the price is also determined by what market the seller is targeting.

The venture can be designed to target customer groups in which the market analysis shows the greatest or most feasible demand. If, for example, the venture is based on expanding a nutrition program into general food services, it can investigate the size of several markets or market segments that exist for the same product. Examples would be senior citizen centers; child care centers; and institutions such as schools, hospitals, and businesses. It can then determine whether enough demand exists in any of these segments alone or in several combinations to support the venture. (Remember that demand means not only need for the product or service but also the ability to pay for it.) The organization can then choose which market segments to target for the highest possibility of success.

Conducting the total market analysis, the organization should be asking what choices exist and which ones will make the venture the most feasible. Once this is determined, how much competition there is for that market should be researched.

Competition

When defining the competition, one must look at not only who sells the *same* product but also who sells substitute or alternative products. The local chamber of commerce and state and federal business censuses can help competitors and provide vital information about them. Ideally, the following information on each competitor should be compiled, if available:

- Location
- Products

- Customers
- Market share
- Sales and market percentage
- Competitive advantages
- Analysis of how they compete
- Growth potential
- Community cultural dimensions

The significance of location depends on the type of business being analyzed. If the venture is a grocery store, it should probably not be located next door to its major competitor. Retail clothing stores, on the other hand, often benefit from being grouped near each other, as the group can attract more business than each store alone. The state development department, the chamber of commerce, and business schools and libraries should have information on the location needs of various businesses. Be careful not to eliminate competitors outside the venture's defined geographic market area. Customers may go out of their area to shop if their alternatives are limited or if the more distant store has better products or lower prices.

Under the heading of "products," one should try to define what similar goods and/or services competitors sell. One should determine what kinds of customers competitors attract—for example, does one childcare center in the area attract mostly parents who have the time and inclination to volunteer? Does another serve single-parent families or families in which both parents work full time? What market segments are served by each competitor?

Competitors' market shares relate to how much, numerically, of the total market each has been able to capture—that is, the volume of the business. The market and sales percentages tell how significant the market share figures are. If a business serves 2,000 customers in a year, is this 5%, 10%, or 20% of the total market? Keep in mind that a single product or firm seldom captures a market.

Sales percentages can be determined by establishing how much consumers in the defined market spent on the product during a given period (total sales) and how much was spent buying the product from each competitor. The chamber of commerce, local business schools, and library may have resources that specify these figures by individual firms.

Competitive advantages are the keys to a firm's success. How does each business attract its customers? Is it in a convenient location? Does it offer free parking or generous credit terms, free delivery, or installation? Are its prices lower, or does its product have a marketable difference in quality?

To determine the competitive advantages of different firms, try calling directly and take note of their advertising. What image are they projecting? What services do they offer? Learning about the competition is the first step in determining how the venture can compete. In addition to the kinds of advantages included in these questions, a venture may also be able to capitalize on its relation to the community as a whole.

Under competitive advantages, one should also analyze how competitors may respond to the venture. Are they likely to cut prices, increase advertising, or expand certain product lines? How much additional risk do competitors' possible responses impose on the venture? What competitors do will probably relate to how they currently market themselves.

A competitor's growth potential does not necessarily mean the possibility of expansion in the physical size of the store or facility but its potential for increasing sales and market percentages. This can be assessed from an analysis of its competitive strategy or advantages and the projected growth of its market segments or buying power. If accessible, the growth patterns of the business over the past several years can also be analyzed.

The previously given information will provide a realistic assessment of the venture's total estimated market share. Once this has been determined, it is possible to project the sales volume, a critical element in its financial feasibility.

Financial Analysis

Numerous publications, such as Seidman's *Economic Development Finance* (2004) and Giles Bischak's *Fundamentals of Economic Development Finance* (2011), go into depth about different aspects of financial feasibility. White and Kotval's (2012) *Financing Economic Development in the 21st Century* also offers a useful compendium specifically addressing local economic development. Accountants may also be able to provide valuable assistance in understanding and completing various financial statements. We focus here on six important financial analysis tools:

1. Estimates of initial financial requirements
2. Break-even analysis
3. Financial scenario development
4. Profit and loss (P&L) presentations
5. Financial cash flows
6. Return on investment (ROI) projections

The first five of these tools are used to determine the financial profitability and debt service capacity of the project. The last tool is a measure of the

project's ROI capability, a measure often compared with that of other projects in investment decision making.

Each of these financial projections is sensitive to the assumptions and projections made under the other feasibility factors. For example, if the venture requires an engineer or manager (who will probably command a high salary), that salary requirement will increase the venture's start-up and operating expenses. There may be many alternative ways of operating the business that could alter its financial standing. A business may, for example, have the choice of either manufacturing some parts itself or purchasing them. Financial feasibility could depend, to a large extent, on the alternatives selected for starting the undertaking. It may be beneficial to make several projections based on different alternatives so that they can be compared and the most feasible option chosen.

Estimates of Initial Financial Requirements and Financial Sources

The first step in determining a venture's financing requirements is to calculate all the expenses to be incurred before the business brings in money to cover costs. This includes three categories of expenses: start-up and initial operating costs and a reserve for unanticipated expenses. But the investors from whom funds are sought have to be considered as well. Good, straightforward financial presentations are excellent. However, some investors want to see other items, such as the following:

- *Leverage*. How will the start-up capital be used to gain other resources from third parties—donors, government, and the like? This needs to be built in to financial spreadsheets for the donor, lender, or investor.
- *Return to community*. A new criterion for many investors who realize that if the community is not part of the project, there may be costly delays. Projects that demonstrate community participation and sense of ownership are more likely to persevere, so the investor can be assured of realizing the anticipated return.
- *Sustainability contributions and returns*. How adoption of best practices for material and energy use as well as waste handling will contribute to the financial performance of the company while creating a lower environmental footprint and other benefits to the community.

Standard Financial Requirements

Start-up expenses are the costs associated with developing and setting up the business. They include market research, technical feasibility studies, cost

of hiring employees, purchasing equipment, deposits on premises, remodeling, and initial inventory. Start-up costs also include the salary or living expenses of the people starting the business. Although some of these costs may be subsidized initially, all expenses should be recorded carefully so that the true costs can be calculated.

Initial operating expenses are the costs of running the business until it reaches the break-even point, where income equals expenses. These expenses include fixed costs, such as rent, insurance, and other payments that do not vary according to sales, and variable costs, which are expenses that do vary with regard to sales, such as advertising and wages. Precisely which costs are categorized as fixed or variable depends in part on the type of business.

A *reserve for contingencies* is required to cover unexpected contingencies and changes in the venture development plans. These costs are extremely variable—although, as a general rule, they are projected at 10% of total project cost. A worksheet that can be used to estimate the venture's financial requirements is set out in Table 12.1. It may be adapted to match the venture being started. The estimates for each expense category should be as detailed and accurate as possible, though start-up costs can be filled in immediately. To estimate the initial operating expenses, however, the venture's break-even point must also be calculated.

Break-Even Analysis

The break-even analysis shows the relationship between total income and expenses at varying levels of production, sales, or provision of services. It

Table 12.1 Opening Financial Requirements

Start-up requirements
Financial analysis
Legal costs
Initial staffing
Contractors (architects, engineers, etc.)
Office (rent, purchase, use home or coffee shop)
Refurbishments of home or facilities to operate enterprise—short term, long term
New or used machinery
Cost of products

Marketing
Environmental and waste handling fees
Community contribution(s)
Borrowing costs
Utilities options—generate energy and use recycled water
Taxes or tax breaks
Insurance
Contingencies (at least 10% above total budget calculation
Total expenses

indicates at what level, given certain conditions, sales will reach the break-even point. At that point, income exactly equals expenses. Prior to this, the venture operates at a loss and must be subsidized. Subsequently, it generates a profit.

A venture could have several different break-even points, depending on the conditions under which it is operated. Such conditions, for example, are the number of employees or whether the business has its own delivery truck or hires a deliverer. Changes in these factors can cause variations in expenses and income.

For the break-even analysis, expenses are calculated as total fixed costs plus total variable costs over a certain period (e.g., 1 month):

$$\text{Total costs} = \text{Total fixed costs} + \text{Total variable costs}$$

Income is calculated as the number of units sold (either products or services) multiplied by the price of the unit:

$$\text{Total income} = \text{Number of units (products or services) sold} \times \text{Price of 1 unit}$$

Break-even analysis establishes whether the level of sales income will cover expenses. Once this is known, it is possible to calculate how long it will take to achieve the necessary sales level or whether it is possible for the venture to capture that particular amount of sales. This evaluation is made in conjunction with the information gathered in the market analysis. Based on how many months it will take to meet the projected break-even point, the

operating expense portion of the initial financial requirements of Table 12.1 can be estimated.

Development of Financial Scenarios

Once all the project's initial financial requirements are known, the local development organization should develop a series of financial scenarios based on Figure 12.2. Each scenario should be developed using realistic projections of the costs involved. Several need to be constructed using best-case to worst-case possibilities. Each component of the scenario should have a carefully developed narrative that explains how this form of funding can be obtained and the chances of obtaining it. In planning a new project, the necessary type of financing must be defined clearly. Failure to do so results not only in wasted time and effort but also in unnecessary confusion and, occasionally, failure.

From the community's point of view, a project's financing requirements are clearly defined by the purpose for which the funds will be used. The capital market institutions, however, define financing requirements by an entirely different set of criteria. To succeed in financing a project, financing needs must be defined using the criteria of both the project and the capital market.

The criteria used by lenders to analyze a financing package reflect six basic concerns:

Term. When and at what rate will the invested funds and interest be repaid? How does this correspond with the supplier's source of funds and stability?

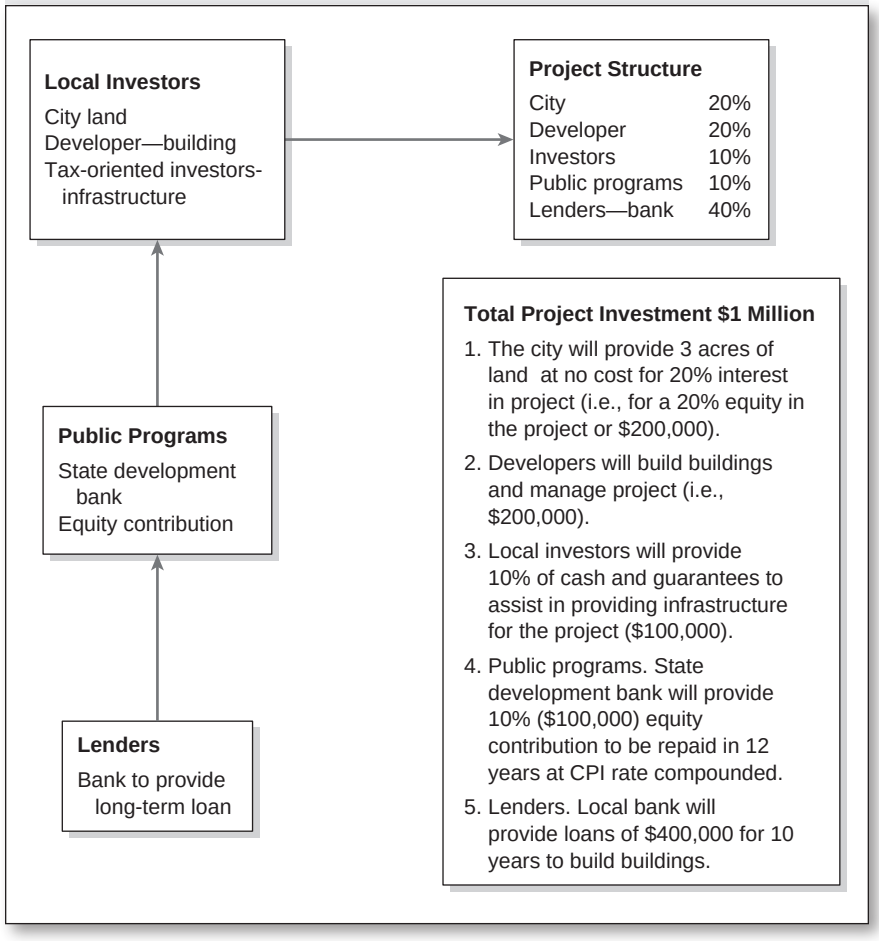
Risk. What is the primary source of repayment, and what is the probability that the invested funds will be repaid from this source? Is there a secondary source of repayment, and what is the probability that the funds will be repaid from that source if the primary source of payment fails to materialize?

Administrative cost. How much time and effort per dollar lent or invested will be required to ensure proper repayment and adequate control?

Return. What is the rate of return to the lender?

Community benefits. Will the investment result in the investor receiving additional deposits or make a contribution to new jobs, related business, goodwill in the community, or other tangible or intangible benefits?

Figure 12.2 Finance Development Scenarios



Portfolio assessment and expertise. Banks, insurance companies, and other lenders specialize in different areas of expertise, such as home-loan banks or industrial banks, and tend to keep their money in those sectors. Does the investment fit the institution's geographic, financial, sustainability, and professional involvement?

As we show, this is an entirely different set of criteria than that used in defining earlier financial requirements; it will therefore generate very different definitions. The following example of the financing requirements for a hypothetical community business venture demonstrates the differences in definitions. A community wishes to fund the industrial estate discussed in

the financial scenario. In a given project plan, it has been determined that approximately $2 million of finance will be required, to be used as follows:

1. Purchase property—1,000,000
2. Purchase equipment—$400,000
3. Carry receivables and inventory—$400,000
4. Early losses and contingency—$200,000

Total—$2,000,000

When viewed by potential financiers, however, this same financing package will look quite different, as shown next:

1. Real estate loan, 20-year, minimal risk, low administrative cost, low return, no secondary benefits, good portfolio fit—$400,000
2. Secured equipment loan, 5-year, fair risk, fair yield, low administrative cost, will receive sustainability offsets, fair portfolio fit—$200,000
3. Accounts receivable factoring, annual renewal, acceptable risk, high administrative cost, high yield, no other benefits, good portfolio fit—$200,000
4. Required equity to secure above—$1,000,000
5. Additional required equity—$200,000

Total—$2,000,000

To successfully prepare a realistic project plan, financial requirements need to be marketed. To avoid wasting valuable time and goodwill in locating the right financial sources, the project's financing must use the market's criteria.

Cash Flow Analysis

The Profit and Loss Statement

The venture's break-even point is determined by calculating its income and expense projections. These can be laid out graphically, in a quarterly time frame, on the venture's projected P&L statement, sometimes referred to as an "income and expense statement." A sample P&L statement is provided in Table 12.2.

Table 12.2 Project Profit and Loss Statement

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
Total net sales				
Cost of sales				
GROSS PROFIT				
Variable expenses				
Human resources				
Taxes				
Security				
Marketing				
Digital information and information technology (IT)				
Legal Accounting				
Office supplies				
Telephone				
Utilities				
Miscellaneous				
Total variable expenses				
Fixed expenses				
Depreciation				
Insurance				
Rent				
Taxes and licenses				
Loan payments				
Total fixed expenses				
TOTAL EXPENSES				
NET PROFIT (LOSS) (before taxes)				

The P&L statement is a quarterly projection of operating expenses, combined with a quarterly projection of income (sales minus the cost of sales). Cost of sales includes the costs directly incurred by the business in producing the goods sold. In a manufacturing operation, this includes the cost of converting purchased materials into the finished product—raw materials, direct labor, equipment repairs, and so on. In a retail operation, cost of sales may simply include the purchase cost of the inventory that was sold. Trade journals and associations provide an average cost of sales for many industries.

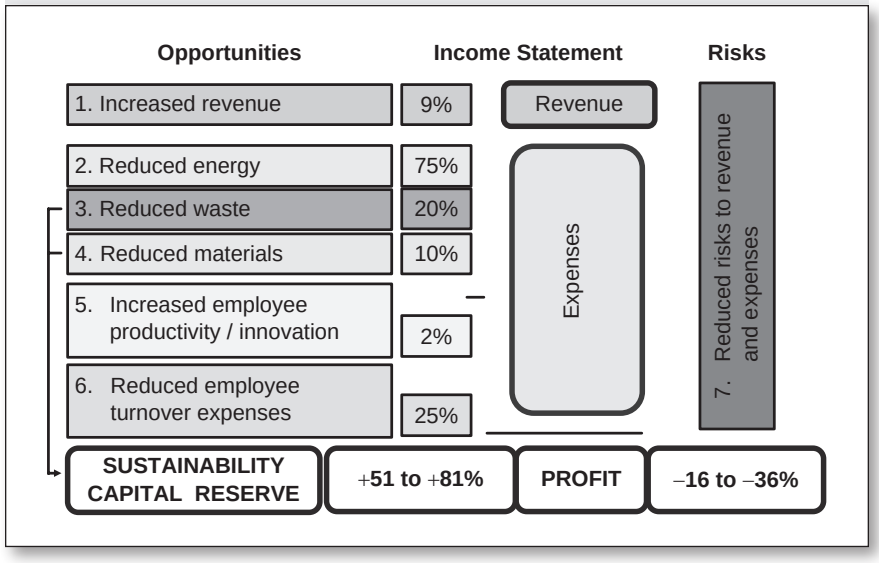
These can be used for comparison or rough estimation but should be adjusted to reflect the venture's specific circumstances.

The P&L statement should be accompanied by a statement of the assumptions used in making the projections. This is especially important if several variations of the venture are being tested within the financial feasibility study. It is also a good idea to develop several P&L statements for each variation on the venture: an "upside" projection that shows what it will look like if everything goes perfectly, an expected statement based on reasonable assumptions and projections, and a "downside" statement that shows what it will look like if the venture runs into a lot of problems or if circumstances vary a great deal in unexpected and negative ways. Once all the categories are filled in with projected figures, the total expenses are subtracted from the gross profit (sales minus cost of sales). The resulting figure is the venture's projected monthly net profit before income taxes.

The Corporate Shift to Sustainability

A 2010 worldwide survey of 766 CEOs documents the increasing adoption of sustainability practices in firms (Lacey et al., 2010). The survey identified three key drivers for the shift to sustainability: (1) 72% of CEOs saw the incorporation of sustainability practices as a way to enhance the firm's brand or reputation, (2) 44% saw it as an opportunity to grow revenue and reduce costs, and (3) 31% saw it as a way to recruit and engage quality employees. Bob Willard (n.d.) has developed a number of tools to help firms analyze the business case for adopting sustainability, including spreadsheets that estimate the profitability gains when data for a specific company are entered. Figure 12.3 depicts Willard's seven areas of concern to the firm, which can be mitigated through the adoption of sustainable practices: (1) revenue generation, (2) energy costs, (3) waste generation, (4) materials use, (5) employee productivity and innovation, (6) employee cost and turnover, and (7) the risk of not meeting revenue and expense projections. Based on firm research, adoption of sustainability practices mitigates all seven areas of concern and can increase profits from 51% to 81% while reducing risk by 16% to 36%.

Figure 12.3 Sustainability Business Case



Source: Willard (n.d.).

Traditional economic development implementation plans and specific analysis tools such as P&L statements are as applicable to sustainability-focused strategies as to traditional strategies. The need to make the business case for sustainability is imperative—and all the more so because of the deep recession that began in 2007 that has been followed by such a slow recovery. As more firm experience and data for those making the sustainability shift become available, however, economic developers are finding that making the case becomes a lot easier.

Project Sustainability

Project sustainability depends on how well the project does financially as well as meeting the social and environmental needs of the community. Cash flows reflect one aspect of sustainability, along with the returns on investment for the project in both financial and social terms.

Cash Flow Projections

Cash flow projections are similar to P&L statements except that they deal with the cash a business will actually have on hand and the bills actually due each quarter rather than all of the income (some of which may be in the form

of sales made on credit) and all of the expenses (some of which will not be paid during some months). The projected quarterly cash flow indicates whether the venture will have enough cash to pay its expenses each quarter or whether it will need short-term financing during some periods. A sample cash flow worksheet is provided in Table 12.3. "Cash flow cumulative" equals the cash flow quarterly for that quarter of the column plus the cash flow quarterly from the previous quarter. As with the P&L statement, you may want to make several projections based on how different circumstances, such as leasing or purchasing equipment, will affect the venture's projected cash flow.

Table 12.3 Cash Flow Projections

Start-Up Prior to Loan	**1st Quarter**	**2nd Quarter**	**3rd Quarter**	**4th Quarter**
Cash (beginning of month)				
Cash on hand				
Cash in bank				
Cash in investments				
Total cash				
Income (during month)				
Cash sales				
Credit sales payments				
Investment income				
Loans				
Other cash income				
Total income				
TOTAL CASH AND INCOME				
Expenses (during month)				
Inventory or new material				
Wages (including owner's)				

Start-Up Prior to Loan	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
Taxes				
Equipment expense				
Transportation				
Loan repayment				
Other cash expenses				
TOTAL EXPENSES				
CASH FLOW (end of month)				
CASH FLOW CUMULATIVE (monthly)				

The Projected Return on Investment Ratio

The ROI ratio estimates how much money a project will make compared with how much money was invested. It allows potential investors to compare whether the rate of return on one venture will be greater than the rate of return on the same money invested somewhere else. The ROI ratio is considered one of the best criteria of a venture's profitability and a key measure of management efficiency. Once the venture is operational, its actual ROI can be compared with industry averages as a measure of monitoring the venture's performance.

The ROI ratio is calculated by dividing net profits (before income taxes, if any) for a certain period by net worth at the end of the period. Projected net profit can be obtained from the P&L statement. *Net worth* is defined as the owner's equity, or the owner's investment; it is simply the business's assets minus liabilities. It does not include long-term debt, although in some cases it can include subordinated debt.

ROI is expressed as a percentage. As a simple example, if net profit before taxes for a 3-month period is $5,000 and net worth at the end of the period is $20,000, then the ROI ratio is 25%.

$$\frac{\$5{,}000}{\$20{,}000} = 25$$

In general, a ratio of between 14% and 25% is considered a desirable return for investment and possible future growth.

Cost–Benefit Analysis

Cost–benefit analysis is a complex subject beyond the scope of this book. Thus, we will deal with it only in general terms. The following review of the basic notions of cost–benefit analysis should be supplemented by more extensive and detailed discussions.

A cost–benefit analysis examines a proposed project's net contribution to the local economy and community. It compares the local community's potential success at achieving fundamental objectives by pursuing a particular project against opportunities lost because resources were committed specifically to that project.

There are various techniques of cost–benefit analysis. The three most commonly used, however, are (1) the net present value (NPV), (2) the benefit–cost ratio (BCR), and (3) the internal rate of return (IRR). Each of these techniques—and in fact the entire concept of cost–benefit analysis—has basic limitations. Before mentioning these limitations, however, the various techniques will be outlined briefly.

The first step in preparing the cost–benefit analysis is to estimate the project costs. These estimates should include all capital and operating costs calculated on a yearly basis for each of the years in which the project is expected to operate. The projected financial statement discussed in the preceding section will be a good starting point for identifying these costs. It must be appreciated, however, that these calculations reflect the project costs to its sponsor or operative entity, not the project's economic cost to the community. To determine the project's economic cost, changes must be made to the financial cost calculations. In determining economic costs only, those payments that reflect the actual use of a societal resource must be charged against the project. Payments that simply represent the transfer of control over resources from one segment of society to another should be deducted. These transfer payments include project costs such as taxes, loan repayments, and interest repayments on loans.

Sunken costs are defined as those that have been incurred on the project before the cost–benefit assessment was initiated. They should, of course, also be excluded from the cost of the project for the purpose of deciding whether to proceed with it. Only resource costs that can still be avoided are relevant. For example, the economic merit of a project designed to complete another project does not depend on the costs already incurred but only on the cost of completion.

The next step is to estimate the benefits generated by the project for each of the years for which it is expected to operate. These benefits will include revenues from the sale of the goods and/or services generated and also money from the sale of any remaining equipment at the end of the project's lifetime. Contributions to society should also be added into the calculation of project benefits. To reflect these social contributions, the project's wage payments to previously unemployed workers and the price of its services must be weighed more heavily than their actual market value. This would signify in economic terms the project's contribution to the local economy and community. It must be noted that wages are counted as project costs; therefore, in charging costs to the project, the wages paid to previously unemployed people are reduced by an appropriate amount. The price of services, on the other hand, is counted as project revenues. Therefore, in assigning benefits to the project, the revenues gained from it are increased by an appropriate amount.

The process of identifying project costs and benefits is difficult. Table 12.4 presents an overview of the complexity of the issues described. The process of adjusting cost and benefit items to reflect the relevant community values and objectives is known as *shadow pricing*. How shadow prices are determined is a question best answered by an experienced cost–benefit analyst. Once the cost or revenue (benefit) items have been adjusted to reflect the relevant social or community values, we can proceed to calculate (1) the NPV, (2) the BCR, and (3) the IRR.

The NPV is, quite simply, the amount remaining after subtracting the present value of all project costs from the present value of all project benefits. The key term is *present value*. This concept can be explained as follows: Because the project's operations occur in the future, it will incur costs and produce benefits at different points in time. Hence, it is necessary to express future costs and benefits in terms of their present worth—that is, in a chosen base year. This can be accomplished by using a social rate of discount, which is a specified percentage that devalues future project costs and benefits.

The BCR is the present worth of all project benefits divided by the present worth of all project costs. The decision rule is simply that a project contributes to society if BCR is greater than 1. The IRR is the discount rate that will make the project's NPV equal to zero—that is, the project's net present benefits equal to its net present costs over a given period of time.

There are limits to cost–benefit analysis. First, only those project impacts that can be quantified in economic terms can easily be incorporated into the analysis. Using cost–benefit analysis cannot adequately assess social projects, which may produce benefits such as teaching a community how to organize or instilling a sense of pride and self-worth in the community. Second, the definition of certain benefits must be conceived very narrowly.

Table 12.4 Assessing Project Impacts

Direct Impacts	**Possible Indirect Impacts**	
Employment	**Employment**	**Income**
Construction	Multiplier effect creating other jobs	Multiplier effect
Permanent	Reduction in other jobs	
	Education and training	
Income	**Revenues**	**Land use**
Wages and salaries of employees	Sales	New developments around project such as housing and businesses
Low-income/ disadvantaged groups	Property tax	Increased property values
Profits	Business permits and so on	Housing requirements
Land use	Service costs	Environmental/social costs
Changes in land values	Sewer	Transportation/traffic congestion
	Water and so on	Community amenity
	Schools	Increased air pollution damage and less "room" for additional industrial development because of air-quality standards
		Community social programs

Finally, in determining weights by which to value a project's contribution to society, or in determining the social rate of discount, there is too much room for discretion and arbitrary decisions. Given this flexibility, a cost–benefit analysis can be manipulated to show a social profit.

Put in perspective, cost–benefit analysis allows one to compare competing projects and alternative approaches to the same project. It is not, however, a precise measure of its actual value to society. Because the analysis can consider only some of the social consequences of quantitative project measurement, many important "community spirit" and attitudinal values are lost. In most instances, therefore, it is necessary for the decision maker to

take the calculations of cost–benefit as an approximate measure of the project's actual worth. To improve the cost–benefit assessment, the previously given calculations could be supplemented with a descriptive analysis of the project's nonquantifiable costs and benefits.

Organizational Design

In making a choice of organizational form for the project, a development organization should carefully consider a number of factors:

- Economic development goals
- Amount of control the organization wants over the project
- Internal management and staff capacity
- Impact of potential liability to the local development
- Organization or government associated with the economic risk
- Image in the community
- Ability to obtain outside sources of public and private capital
- Requirements of tax, securities, and business law

Some of the most common organizational forms are nonprofit-related in-house ventures, for-profit subsidiaries, joint ventures, and franchises. These forms will have different tax, business, legal, community, and organizational factors. The local development organization should first decide on its goals for the venture and then work with a knowledgeable lawyer to find the most appropriate form to achieve those goals legally. Selecting the most appropriate legal structure for a project is not a one-time decision. As it grows and changes, both it and the local development organization may have different needs. The project's structure and its relationship to the local development organization can be altered to reflect the changed needs.

Using the Feasibility Study

Once feasibility studies are completed for each of the prospective projects, it is helpful to have each one reviewed by an independent expert and also by members of the local economic development advisory committee. The reviewers will provide different perspectives and valuable expertise. Their evaluations and recommendations for improvement will strengthen the feasibility study and also confirm that its findings are valid.

The reviewed feasibility studies should then be assessed by those responsible for determining whether to proceed with the venture. The evaluation of the feasibility studies should be spread over several meetings of the community or citizen group reviewing them. The first meeting could explain the function of

the feasibility studies to the decision makers, as well as what they should be looking for in evaluating them. A second meeting could be used for the presentation and discussion of the results of the studies. A third meeting could be a community briefing session explaining the project's potential for the community and exploring other hidden costs and benefits. The last meeting would be for the final decision. Once a project has been selected, it is recommended that only one venture be started at a time. This will minimize risks to the implementing organization. The next step is the preparation of a business plan, if appropriate, or a project monitoring and evaluation program.

Business Plan Preparation

The venture's business plan will be closely related to its feasibility study, which will provide most of the data necessary to prepare the business plan. There are important differences between the two documents, however. The purpose of the feasibility study is to explore options for operating the venture in order to assess the possible success of the activity. The business plan will lay out, in detail, how the venture will operate and the assumptions upon which the operation is based. The feasibility study discusses different ways that the business might operate; the business plan describes the way that the business will operate. The business plan is a final check on the venture's feasibility. It is more detailed than the feasibility study and is often longer, especially if technical specifications are involved.

The format of the business plan is another variable. Like feasibility studies, business plans have no standard method. What the plan looks like depends on the type of business and how the plan will be used. Regardless of the format chosen, most business plans should discuss at least the following points:

- The industry and the business (including general industry trends and the history of the business, if applicable)
- The product and service that the business will sell
- The market (including market size, trends, competition, and market share projections)
- A marketing plan (including pricing, distribution, and promotion)
- Prestart-up and start-up plans and schedules
- Manufacturing or operating plans
- Organization and management (including job descriptions, personnel needs, lines of authority, wages, and skills and experience of key personnel)
- Community and sustainability benefits (including economic impacts, environmental, human development, and other social impacts)

- Financial plans (including initial capitalization, proposed financing, and projected financial statements such as balance sheets, P&L statements, and cash flow and break-even analyses)
- Control and feedback systems (including monitoring plans)
- A discussion of critical risks and assumptions associated with the business and the business plan

Most of these issues were at least touched on in the feasibility study, although they are covered in greater depth and detail in the business plan. These basic topics can be covered in a variety of ways. What is important is that they be discussed somewhere in the plan. Seek advice from experts who can help decide what format to use and who understand the business project and the financing.

Monitoring and Evaluation Program

Project evaluation is important for economic development plan implementation or specific projects. It can lead to more efficient and effective projects as a result of systematic, careful analysis of project consequences and costs. It is an ongoing activity, beginning when a plan or project is in the design stage and continuing through implementation. It should also include a full review of the project once it becomes operational. In short, project evaluation begins right at the planning stage, and project evaluation procedures must be evident in the planning process itself. Indeed, the feasibility and business plan documents should include a separate section on the evaluation plan. This section should explicitly identify the following.

Criteria to Be Used in Evaluation

For a project, if the main body of the feasibility document is done properly, evaluation criteria will naturally emerge out of the time schedule, cost and budget limits, and productivity output targets. Key result areas, specified in measurable terms where possible, will be the criteria for evaluation. This is as true of concrete technical projects as of social projects, though the latter are admittedly harder to quantify. The final benefits or effects the project intends to achieve, as defined by the project's both explicit and implicit objectives, should also be included among the evaluation criteria. These benefits may include such items as the following:

- A specified number of job opportunities for low-income members of the community

- Opportunities for management skill development and job upgrading
- Income redirection, given the flow of money in the community
- Venture self-sufficiency
- Facilitation of community development
- Infrastructure development
- Provision of quality goods and services
- Community education opportunities
- Community ownership, control, and decision-making opportunities

Strategic economic development plans for communities are also frequently evaluated by stated goals. For example, the city of Portland, Oregon, established goals for creating 10,000 jobs in four industries: (1) clean technology, (2) activewear, (3) software, and (4) advanced manufacturing in its 2009 *Economic Development Strategy* (Portland Economic Development Commission, 2009).

Evaluation Techniques

This section identifies the evaluation techniques to be used as well as the points in time when they are to be employed. In postproject evaluation, the evaluator's task is to measure if the planning stage did, in fact, reflect what actually occurred. This could mean a recomputation or remodification of costs and benefits in light of changing government priorities. The resulting figures would give developers a more realistic perspective of the project in relation to community objectives. Thus, this section should lay out the cost–benefit premise as the basis for future evaluations to be set.

Other approaches or evaluation techniques include the use of control groups for comparative analysis, baseline measures, sampling, and various data-gathering methods such as field surveys, questionnaires, and interviews. These techniques, again, largely occur at the beginning of a project if a study or research design is planned. If this type of study is done, an experimental test group of consumers and a control group may be determined. Furthermore, baseline measures such as size and number of jobs to be created can be set. Tests or interviews conducted can reveal certain critical aspects or situations prior to the start of the project.

At the time of postproject evaluation, the comparisons made would be the experimental group before and after the project, the control group before and after the project, and an evaluation of results based on the critical aspects studied. Other techniques used would be financially oriented, such as variance analysis, where a study of the budgeted versus actual financial performance is made. If the project did not utilize a budget, however, such analysis would be very difficult, if not impossible.

Time Schedules for Conducting the Evaluation

Aside from scheduling implementation, proposals should schedule evaluation so that it is not indefinitely postponed or indicate an acceptable lapse time in instances in which a project's desired results—especially social—are not evident immediately after project completion.

Budget for Evaluation

This section should include, aside from the total amount and the program breakdowns, the promised or possible sources of funding and the schedule of budget releases.

Organization and Staff Requirements for Evaluation

This section should outline the size of the evaluation team, its qualifications, the reporting relationships, and access to project information and staff.

Those responsible for post-project evaluation must, by definition, assume a comprehensive point of view. Whereas the project's components may be worked on individually during implementation, the evaluator looks at the project as a package. Success or failure is determined by the achievement of the whole venture measured against its objectives.

Often, a team of project evaluators is composed, at a minimum, of both a technical and a project-management expert. The group may consist of three to five individuals from various disciplines with recognized expertise in the line of the project. They are sometimes from universities or research agencies as well as from various government offices. Their expertise and experience are of primary consideration in their selection, however, as the quality of the evaluation work will only be as good as the evaluators themselves.

Opinions differ on the relative merits and demerits of a preponderantly external evaluation team over an evaluation from within the project-operating agency. External teams have objectivity, possibly at the cost of lack of understanding, perspective, or access to background information, both hard and soft; internal teams enjoy familiarity and access at the expense of possible subjectivity.

Conclusion

As we noted at the outset of this chapter, initiation of economic development planning is fundamentally an effort to influence the market economy

when there are acknowledged deficiencies in market outcomes for the community. The public sector is always involved—directly or indirectly—in economic development plan implementation for the purpose of strengthening the private sector and resulting benefits for all of the community. This chapter has focused on the mix of public and private sector partners, considerations, and tools for economic development plan and project implementation.

Significant attention has been given to marketing a community to achieve its economic development goals. This marketing is not just to outsiders but also to those within the community who make valuable economic contributions that the community does not want to lose but rather hopes to strengthen. Significant attention has also been given in this chapter to financing economic development projects and to their evaluation. A well-chosen project implemented through a strong public–private partnership can be a highly valuable catalyst for realizing the goals of a community's economic development plan. The chapter's overview of project viability and financial analysis was intended to give the reader a sense of the effort and complexity involved in creating and implementing an economic development project.

In contrast to the well-accepted steps for project development and analysis, the reader should be aware that the details of implementing an overall economic development plan will vary considerably depending on the size of the community (e.g., a small town or major city or county), the time frame for the plan (e.g., 1 year or 5 years), and specific economic goals (e.g., target specific industry sectors, grow small business, increase the skills of the labor force). Local governments often hire outside expertise when implementing their economic development plans or projects. This expertise, however, augments but does not supplant the public–private partnership that is required for successful economic development implementation.

Note

1. "Highest and best use" of a piece of property generally means a use that is legal, reasonable, and physically and financially feasible as well as provides the greatest return.

Institutional Approaches to Local Economic Development

Institutional approaches to, or structures for, local economic development have received considerable attention in recent years. One reason for this is that more local, regional, and state economic development institutions are being formed. The structure of the economic development program varies according to whether it is a state, substate, regional, or local city or county-wide organization. In some instances, these organizations merely coordinate activities in the public or private sector, and in others the development organization is the de facto project developer. There needs to be a clear distinction between a plan for economic development and a plan for short-term measures, no matter how urgent, to meet immediate community needs. Planning for economic development intends to bring about a lasting and continuing change in the local economy so that it will better serve social objectives. Economic development is an institution-building process. As a result, it requires the establishment of *planning systems and institutions* that can manage the development process over extended periods of time. The planning process, not the plan or document, is significant.

An institution with specific responsibility to coordinate each step of the local economic development process is essential. The development strategy plan, as well as the process itself, requires fiscal resources, technical expertise, leadership, and imagination. Some type of fully staffed, locally based institution must be available to assist in identifying and mobilizing all these resources in order to carry out strategic planning. Matt Kane and Peggy Sand

(1988) summarized the essential characteristics of an economic development organization:

> People and organizations with vested interests in an area's economic development must be drawn into the formation and policy processes for an economic development organization. Different stakeholders will have different goals that must be made explicit and considered. The city government and private businesses certainly need to play a role. But so, too, do downtown and neighborhood representatives, labor unions, city residents, utility companies, environmentalists, other area governments, and officials from local universities. The list of stakeholders will vary from city to city. Some of these stakeholders may be important in setting general directions for an organization, while others may be needed for its day-to-day operations. A community's economic development organization may involve stakeholders in a formal or informal manner. But one way or another, involvement itself is important. Without it, an organization may find it lacks political support to rally the community behind its objectives and programs. (p. 22)

The planning model or approach is as important as the process. This chapter reviews the basic organizational requirements for economic development planning. In addition, case studies of various development organization types are presented.

Organizational Requirements for Local Development

There are several basic ingredients for any local or regional economic development organization. Table 13.1 describes these components and the activities associated with each of them.

The coordinating organization for economic development is best thought of as a set of functions within a structure rather than as a single institution performing all tasks itself. (That is, the activities associated with each of the columns in Table 13.1 can be performed by staffing the organization or by the staff of another existing organization.) For example, the board of directors' function might be performed by the existing city council or a subcommittee of the city council. Alternatively, a group of local governments across a region could form a combined board.

Similarly, the executive director might be a full-time position held by a second staff member of a local government or regional organization. Of course, a full-time professional director would be best. The marketing and

Table 13.1 Components of Economic Development Organization

	Leadership Board Director

Assessment	Promotion	Profiles
Forecasting	Project development	Education and training
Strategy	Financial planning	Community services
	Financial packaging	Regulation analysis
		Local government coordination

finance functions, on the other hand, might be provided by the local chamber of commerce or a consortium of local businesses and financial organizations.

A local university or college may provide ongoing business and economic analysis, and the existing employment services agency might assist with human resource and community assessments.

Clearly, there is a wide range of effective organizational designs. The type of organizational form chosen depends on the size of the community and the level of sophistication of its institutions with respect to economic development. The specific form should be based on an analysis of the potential roles various institutions might play in the development strategy decided on by the community. Regardless of what form the development organization takes, the essential point is that it should have sufficient *authority* and *resources* to undertake at least the following activities:

- *Research*. To provide background information on the area's needs
- *Information provision*. On identified target activities
- *Marketing*. Customized according to specific development strategies
- *Coordination of activities of other groups*. Important to the achievement of the overall development strategy

Funds should be balanced between those devoted to staffing and those provided to staff for work-related costs. Too much funding devoted to salaries can, for example, result in staff not carrying out important tasks because they cannot provide project funding. A well-developed local coordinating body for economic and employment development will have a clearly written definition of management and staff roles and responsibilities. The essential responsibility for overseeing the planning and venture selection process in

the organization must be set forth clearly. The person in charge of analysis must be responsible for preparing and monitoring reports of analysis. Any new roles and responsibilities should always be explicitly identified and added to the workload of a particular staff member.

A well-developed local economic development organization also has strong financial planning controls and a forward-looking financial planning system. The financial system must not only be able to look back and describe what happened in the past—as is necessary in grant reporting—but also to look forward and make predictions so that the organization and its ventures can accommodate and react quickly to changes. The financial system should be structured so that overhead and administrative costs are not hidden but are allocated fairly and openly among the various programs. Strong financial controls enable the organization to keep accurate records of its finances and pinpoint trouble spots quickly.

The local economic development organization should also have a strong economic and employment planning component. This will enable the organization to look to the future and place current and short-term community interests and needs in the context of a long-term perspective on community revitalization and independence. The planning component also allows the organization to systematically increase the capacities of both the community and the organization for economic development activities. Effective targeted marketing programs for development activities are also crucial for success.

A well-developed organization will have a strong connection with the private sector and good relations with all the social groups within the community. This helps ensure that the organization meets the needs and expectations of these groups and enables the organization to make use of the community's resources to create healthy ventures. The support of the private sector is essential for obtaining business advice, financing, and also possible contracts. In addition, the support of the wider community can strengthen the organization's ability to obtain public and other grant funds and can demonstrate that the organization is involving the disadvantaged in the local development process. An appropriate legal structure should form the basis of a well-developed local economic development organization. Appropriate legal structures that reflect the needs and goals of the organization or venture are as simple as possible. This means that the economic development body has no external structure for its venture but houses it internally or that it sets up its venture as a separate subsidiary. Legal structures should allow the organization the amount of necessary control to monitor its investments effectively without interfering in their internal operations. Legal structure should follow function and therefore should be selected after the venture in order to ensure that the structure is appropriate.

Leveraging the nonmonetary resources (e.g., goodwill of the community and political connections) allows the well-developed local economic development organization to make the most of its resources. Indeed, the support and cooperation of local, state, and federal officeholders is essential. The organization identifies and develops additional ventures through vertical and horizontal integration, such as starting a laundry to service an already operating nursing home. The organization may also spin off ventures, when appropriate, to free resources for the support of new ventures.

Public–Private Partnerships

The term *public–private partnership* has permanently entered the lexicon of local government. What is a public–private partnership? Why is it important to consider it as a component of economic development?

Public–private partnerships are not a new phenomenon. They are the legacy of more than 50 years of federal urban policies. In 1938, the federal government embarked on a set of housing assistance programs by chartering the Federal National Mortgage Association (FNMA), now commonly known as Fannie Mae, to create a secondary market for home mortgages. This program created a partnership between the public sector and the private market to produce housing in urban areas. The cities benefited from this national partnership. It was so effective that in the 1960s and 1970s, this concept was extended to rebuilding the inner cities through the Model Cities Program and later the Urban Development Action Grant (UDAG). UDAG was the most powerful stimulus for downtown restoration ever devised. Most of the nation's large cities cleared large portions of their downtowns to open them to revitalization projects crafted at the local level but supported through federal government transfers and loan guarantees. The UDAG program established the framework for local partnerships between government and local private sectors.

In the mid-1970s, local officials began experimenting with a new set of relationships with the private sector in order to complete the projects launched a decade or more earlier under more generous federal support. The lessons learned from UDAGs were adapted in the 1980s, when federal support was withdrawn at the height of local fiscal distress.

City officials became deal makers by the late 1970s. These deals included the provision of essential infrastructure at little or no cost with promise of a return on the city's investment through a soft loan or a portion of the profits from the project. In many instances, cities built public garages for private developers or sold or leased back facilities to retailers. In essence, cities

moved from their traditional role as regulator to one as coinvestor. "This new role marked a change," as Sagalyn (1990) said the following:

> In expectations about the public sector's separateness from the private sector. . . . These strategies placed a high premium on public entrepreneurship and private market feasibility. . . . And increasingly, in bargaining with developers, cities negotiated direct financial stakes in a project in the form of public profit-sharing arrangements, a practice very unlike the usual behavior of cities. (pp. 429–430)

As a result, most local governments entered the 1990s with considerable experience as entrepreneurs in the development process.

No matter what organizational structure is selected, public agencies and private firms have to enter into new relationships to make the development process work. This approach is much more than the public sector merely offering cooperation to the private sector to facilitate economic activities for private gain; it is also far more than occasional meetings between the municipal council and local business organizations, such as the chamber of commerce. Although these activities are important—and perhaps integral to good business–government relations—they do not constitute true partnerships among the sectors. Partnerships are shared commitments to pursue common economic objectives jointly determined by public, private, and community sectors and instituted as joint actions. Analysis of successful partnership efforts suggests the following guidelines:

1. *A positive civic culture that encourages citizen participation and is related to the long-term employment concerns of the community*. The goals for the development process must be shared among the community. Civic institutions that help create jobs and stimulate the economic base can form real partnerships, whereas self-serving business promotion or traditionally insular government—without a development role—cannot find any common ground for a partnership.
2. *A realistic and commonly accepted vision of the community based on the area's strengths and weaknesses as well as on a common conception of the area's potential*. This is the most important area for partnership formation. Without a common understanding of what the community has or what it can become, it is impossible to build a better community. Furthermore, unless there is a realistic vision of the area's potential, the community will never come together to achieve its goals.
3. *An effective civic organization that can blend the self-interest of members with the broader interests of the community*. Enlightened self-interest is undoubtedly the spark that lights the most action. If the

interests of civic leaders, both individually and collectively, can be channeled through some structure in order to achieve what is in the common interest of the total community, the development process will work.

4. *A network of key groups and individuals that encourages communication among leaders and facilitates mediation of differences among competing interests*. This network builds respect and confidence in the community. It allows business, labor, and government to work out their differences in private rather than in public, thereby allowing the focus of public discussion to be on the areas of agreement rather than on the problems of poor relationships.
5. *The ability and desire to nurture civic entrepreneurship—that is, to encourage the risk takers and build their confidence*. Nothing is more damaging to the notion of economic development than communities that dismiss the work of effective people. It takes a few active and motivated persons and bold action to move an area or community into new job-creating ventures. If these people are not rewarded and encouraged, then the development process will stop and the community will suffer the loss.
6. *Continuity of policy, including the ability to adapt to changing circumstances and reduce uncertainty for business and individuals who want to take economic risks*. Too frequently, government, in the absence of any consistent goals, pursues ad hoc policies disruptive to the development process. There are steps that can be taken to minimize this. First, the community should work on a set of development policies that act as a frame for their actions in the development arena. For example, a community might adopt policies that promote labor-intensive developments. Subsequent projects, as well as regulations, have to be examined to see whether they fall within the framework. Second, local government and private enterprise, along with unions and community groups, should try to determine what kind of community they really want and build social and physical infrastructures accordingly.

These six guidelines form the basis for any organizational structure the community decides to adopt. Essentially, public–private partnerships are bridges of trust based on similar objectives but mindful of differences in roles.

Achieving public–private cooperation is the first step toward engaging in actual projects. The projects will follow easily if the structure is there to facilitate the relationships.

Finally, a key aspect of the well-developed local economic development organization is its aggressive identification of new areas for growth. For continuing success, the organization must constantly move forward, identifying new ventures and activities that will help it to meet its goals. Local government authorities and/or neighborhood associations must, in order to create new development initiatives, employ expert officers to act as project

coordinators, economic development specialists, or persons working under similar titles. These individuals will in the following pages be referred to as economic development specialists.

The Economic Development Specialist

The appointment of a local economic development specialist to plan and/or direct the local development program has numerous benefits for the community, irrespective of whether a decision is made to form a new organization to guide the development process. This position helps bring both focus and commitment from the total community. The position also brings visibility for the community in wider economic and political circles. The duties of development officers vary according to the sophistication of the development system in a community. In some instances, development officers are executives who direct other specialized staff or large regional development organizations. However, most communities are likely to require an individual who cannot only guide the development process but also accomplish the following tasks:

- *Research*. To assess community economic and social needs
- *Planning*. To organize people and information and set goals and priorities
- *Management*. To develop and promote specific projects involving public–private partnerships
- *Leadership*. To facilitate the effective functioning of the local development board or commission as well as lead staff

Institutional Approaches to Local Economic Development

As mentioned previously, the actual structure of a local development organization is dependent on community circumstances. It is, however, extremely important for everyone to understand the old management principle: "Form must follow function." Too frequently, communities adopt a structure based on reading about the experiences of other places. The correct procedure is to design an institutional form that fits the political and economic situation. First, however, a community must appreciate that, regardless of the form the development organization takes, it is ultimately an "enterprise" and must have sufficient capacity to perform. There are two important characteristics that development organizations must possess:

1. *Authority*. The legitimate power to act on behalf of the local government, community, unions, businesses, and other constituent groups

2. *Resources*. Staff, financial access, technical assistance, information, and other resources required by local economic and employment development projects and programs

For a development organization to be successful, it must be able to use a combination of authority and resources to facilitate work. If an organization exists in name only and has only nebulous coordinating responsibilities, it is unlikely to gain the respect of the business community. The community organization has the responsibility of specifying the limits of such authority at reasonable levels. The absence of delegated responsibility will mean that the organization cannot operate effectively and that the development officer spends too much time obtaining permission to function effectively.

A Typology of Development Organizations

There are three general types of development organizations. First, there are *government or public* development organizations. These are components or complete delegate agencies of city or county government. Second, there are *private development associations,* which are sponsored by local or regional businesses and operate with the permission or endorsement of local government. These are private bodies usually affiliated with or a component of chambers of commerce, manufacturers, or other similar bodies. Finally, there are *local development corporations* that are a form of public–private partnership. They act as semi-independent bodies that coordinate and actually manage development projects for or with local government. These organizational approaches are seldom observed in their pure form; nevertheless, they will be described here as "archetypes." Each has its advantages and disadvantages.

A major advantage of the public agency is its connections to the political system; as such, it has access to the political resources of local as well as state and federal governments. Its chief disadvantage is the persistent delays of government bureaucracy. In local development planning, where responsiveness to the market and opportunity is essential, this may be a fatal flaw unless local government genuinely supports the agency through city council actions. There are other important advantages associated with public economic development organizations that the International Economic Development Council (IEDC) *Managing Economic Development Organizations Training Manual* (2011) lists as the following:

- Use of finance tools to leverage private investment such as public grants and revenue sharing funds

- Municipal powers that can be utilized for economic development initiatives such as "taxing authority, eminent domain, ownership of land, rights of ways, zoning and regulatory powers, and the ability to construct and operate public facilities and services" (p. 90)
- Use of other local government resources (planning, research, public works)

On the other hand, the disadvantages of public organizations for economic development include the following:

- Economic influence is essentially limited to their political boundaries.
- The ability to finance initiatives is subject to municipal debt limitations.
- Prohibitions may be given on lending money to the private sector, participating in profit-making activity, and building or operating non-public facilities.
- There may be elected official turnover or weak commitment of officials.
- There may be private sector mistrust as well as public disclosure laws that "prevent private negotiations with relocating businesses or developers" (p. 91).

Private development organizations can act quickly, but they are bound by limited interests. Generally, they are concerned only with the promotion of existing private business and with the real estate and investment opportunities associated with new firms. Private organizations seldom involve themselves in wider employment and community welfare activities. Private groups, however, can function far more effectively than government bodies in economic sectors such as tourism and retail development. Private economic development organizations also have advantages and disadvantages (IEDC, 2011). Their key advantages include the ability to do the following:

- Make decisions quickly and not be accountable to a broad constituency.
- Raise funds, invest equity capital, and make profits.
- Insulate individual investors from risk.

Their key disadvantages are that they:

- Lack municipal land powers such as eminent domain
- May have less public sector support
- May have to pay taxes on investment income
- May sometimes shift efforts away from economic development because they are self-supporting

Development corporations, or "joint power" organizations, that involve government as well as business and community are the most used form of organization because such organizations continue to enjoy government and

private support. In some instances, however, the organization is given too little power or responsibility from either the private sector or government agencies. Key advantages of public–private economic development organizations include the following (IEDC, 2011):

- Are less subject to politicization of their work
- Can incur greater risk and make bolder decisions because their board is unpaid and unelected
- Augment government powers with "functions and powers of legal, private subsidiaries and affiliates" (p. 100)
- Can draw on the expertise and resources of the public and private sector
- Protect decision makers from financial risk via incorporation
- Can be self-supporting through assessing fees and dues

Compared to solely public or private economic development organizations, the public–private form has one key disadvantage. While limited accountability to the public sector can create greater flexibility and provide access to more tools, it also can lead to eroded public support if the public–private economic development organization's goals are not perceived to serve the public interest appropriately.

When considering the three forms of economic development organizations (public, private, public–private), the following questions should be kept in mind: What role is the organization to perform? What resources are available for the organization? What are the capabilities, interests, and needs of the locality?

Economic Development Agencies as Units of Local Government

Some local governments consider economic development a regular responsibility of government that should be incorporated into its organization structure. A development department is a very comprehensive organization, and the staffing required to run such an organization is effectively out of reach for most small local government authorities. Large cities have fully staffed economic development departments. This structure has the advantage of close communications, as shown in Figure 13.1.

Independent Private Development Agencies

This type of agency has existed for some time in various local government areas. In many instances, the tourism or retailer associations have evolved from more elaborated development bodies. The chamber of commerce or some existing business group usually acts as the nucleus for this

Figure 13.1 Model Structure of Development Organization That Is a Unit of Local Government

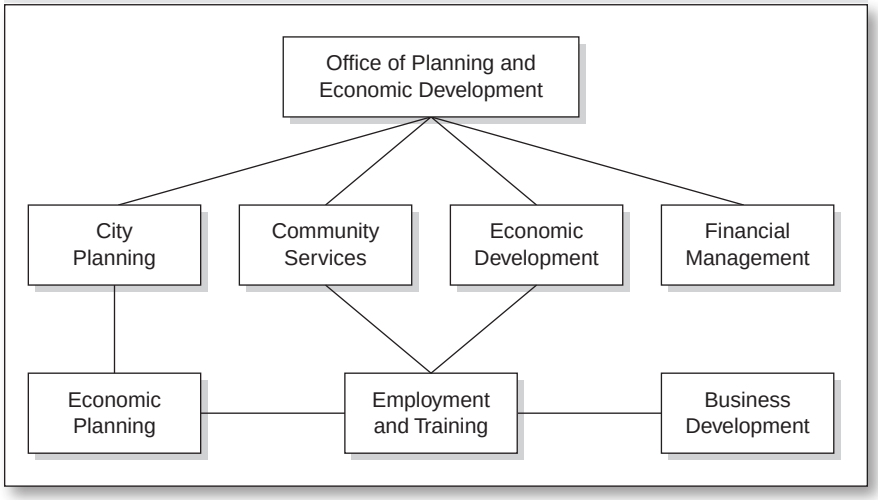

Figure 13.2 Private Development Organization Model

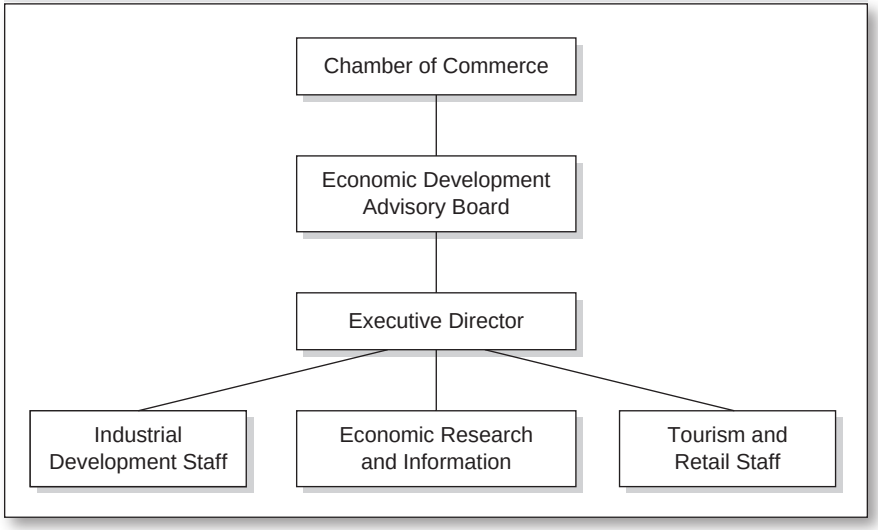


organizational framework. These organizations are effective as lobbyists for local interests with the local government. They may also raise private funds and become involved in high-risk ventures because of their status. The major benefit to the community of such a body is that it puts peer pressure on businesspeople to get things done for the community. Some smaller communities have decided that this is the best approach because the local government can assist these organizations by providing land or facilities, but it

does not risk taxpayer revenue since it cannot (by law) be directly involved in deal making (see Figure 13.2).

Economic Development Corporations

The economic development corporation (EDC) is an excellent vehicle and should enjoy strong support from both the public and the private sectors, although there are instances where this support is lacking. Nonetheless, this institutional approach makes it possible to bring together the complete resources of the community if the public and private sectors have equal stake in the corporation.

The structure of a local development corporation can be very sophisticated or relatively simple. Many EDCs have moderately complicated structures. The most important feature of this institutional form is that it can perform all of the tasks local government delegates to it while acting as a private body. For example, it can do the following:

- Administer development funds from both public and private sources.
- Manage industrial estates or commercial facilities for the government.
- Operate parking facilities and other services as joint public–private ventures.
- Enter into contracts and borrow funds for various development projects.
- Engage in marketing and promotion activities.
- Provide a "one-stop" business service.
- Act as a small business assistance center.
- Provide marketing and technical assistance for local firms.
- Sponsor industrial and commercial attraction efforts.

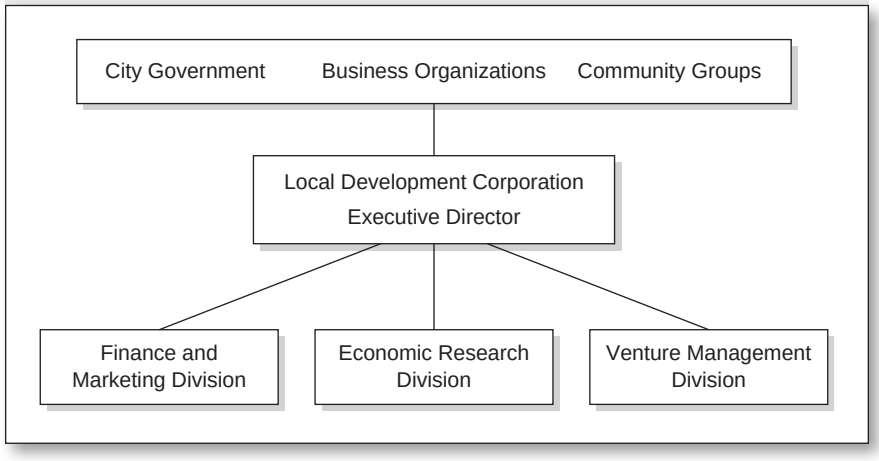
Clearly, a community development corporation (CDC) is the most flexible structure for carrying out the multiple development tasks of dealing with poverty and social maladies in distressed communities. Nonetheless, we need to be mindful of the following:

> We're not going to undo in ten years what it took 200 years to create. . . . If every CDC accomplished its goals, we would still not see the end of poverty. Poverty is the creation of the institutions we live in. . . . CDC can be important to a larger agenda that addresses economic injustice. (Bauen and Reed, 1995, p. 15; see Figure 13.3)

Summary of Institutional Approaches

Communities, regardless of their size, need to select an organizational form that meets their requirements. None of these forms is set in concrete:

Figure 13.3 Local Development Corporation Model



They can evolve over time, with components and functions being added or deleted as the need arises. There is no point in "reinventing the wheel," however. Adequate institutional development experience is available nationwide for communities to select a development framework to meet their needs. After the type of structure is selected, civic leaders can then tailor it to local circumstances.

Conclusion

Developing the correct organizational form is just as important as determining an economic development strategy. The form as well as the staffing will depend on the resources as well as the situation. Almost all economic development depends on public–private coordination and cooperation.

No matter what original forms of local economic development organization occur in a locality, it is likely that there will be pressures for them to change and adapt over time. In a 2012 report, "New Realities for Economic Development Organizations," Nourick (2012) observed the following: "EDOs of all sizes have been analyzing their strategic priorities and the practitioners' role in the community in order to be more effective and competitive in today's erratic economy" (p. 5).

In the aftermath of the Great Recession, economic development organizations have reduced funding from the traditional locally invested banks, utilities, and newspapers. They are turning to such disparate but locally vested entities such as hospitals, universities, cable companies, waste management companies, law firms, and auto dealerships (Nourick, 2012).

As public revenue has diminished, private funding of economic development has increased. The share of private-sector funding of economic development has grown from 30% in 1998 to 70% in 2011. As a consequence, economic development organizations must respond to increased pressure to track their performance in order to show what the return is to their investors. The trend toward private investor funding has also created greater pressure to demonstrate financial and organizational efficiency. This, in turn, is leading to more consolidations and mergers of economic development organizations (Nourick, 2012).

While more efficient use of resources is an important objective of economic development, a key question will be how well the multiple interests of local economic development (workers, firms, real estate, etc.) are met in the variations of consolidations and mergers that are taking shape.

Local Economic Development Planning's Response to a Global Economy and Climate-Challenged Planet

By now, it should be clear to students of local economic development planning that their field is complex and multifaceted. Local economic development may have been practiced in a simplistic manner in the past, but no locality can afford to make that mistake now nor hire local economic developers who do so. The ability of a local economy to thrive is contingent upon many factors, and those over which economic developers can and should have domain have been highlighted in this book. However, economic developers may also have a role to play in coordinating or facilitating responses to locality aspects that are not specifically their direct responsibility. For example, while disaster management planning is not specifically the responsibility of the local economic developer, if such planning is not in place, all of the economic developer's and the locality's hard work can easily be wiped out through hurricanes, roaring fires, earthquakes, or other natural disasters. Without excellent transportation systems (surface and air, private and public), efficient movement of goods and people cannot occur and economic development activity is stifled. Thus, economic developers often have to be advocates for transportation improvements. Likewise, they need to be advocates for an adequate supply of workforce housing in order to attract a

competitive labor force. And they need to be advocates for quality health care and prekindergarten through high school education. These are essential building blocks for creating a quality labor force and a high quality of life that increases the community's attractiveness. In particular, a strong education system is a key requirement for economic development strategies that are focused on advanced technologies and processes.

In the final chapter of this book, we discuss technology and innovation economic development strategies that are an essential response to the global economy as well as economic development strategies necessary to cope with extreme weather events. We also discuss other essential strategies for protecting, growing, and even reinventing local economies.

Finding Solutions Through Innovation and Technology

It is important to note at the outset that while innovation and technology are essential components of the response to climate change and maintaining competitiveness in the global economy, they will by no means be the sole solution. Changes in lifestyle and ways of doing business that reduce dependence on carbon-based resources are required to minimize climate change and do not necessarily require new technological solutions. For example, it is essential to shift the predominant mode of transportation away from petroleum-fueled private automobiles and trucks by using existing mass transit technology and the lowest of technology (bicycles and feet!).

High technology became the "it" strategy of economic development during the final two decades of the 20th century and continues as the accepted economic engine for the 21st century but is now referred to by the more meaningful term *advanced technology*. Further, this advanced technology is developed within a knowledge economy. The literature on attracting and retaining advanced technology firms reveals mixed results. The precise methods, as well as the factors that lead advanced technology firms to select one community over another, are debated widely (Blakely and Nishikawa, 1992; Lowe, 2014; Luger and Goldstein, 1991; Saxenian, 1987; Willoughby, 2000). Public officials at every level enthusiastically support efforts to attract, retain, or encourage advanced technology firms. Nearly every urban region in the Western world has a technology park and an advanced technology strategy. Urban regions in growing economies throughout the rest of the world are adopting the same approaches. Typically, these use university resources and public facilities to create or incubate innovative firms with specialized technologies that can penetrate global markets. In the global economy with high firm mobility, localities have not abandoned firm attraction strategies—especially of advanced technology firms. However, they are

placing increasing emphasis on creating the conditions for new advanced technology firms to take root and make their corporate headquarters in the community à la Silicon Valley, the most powerful metaphor in the knowledge economy. In this region of California, just south of the San Francisco Bay Area, firms and multiple advanced technology subsectors were not attracted but created. Further, as the Twitter case study of Chapter 9 shows, these firms and subsectors have transformed the Bay Area region and are most recently responsible for downtown revitalization of San Francisco.

In fact, most Western-style economies have embarked on advanced technology strategies that emphasize both specific technologies and specific locations. For example, France, Sweden, Germany, Italy, as well as China, Japan, Korea, and India are key examples of nations embarked on ambitious regional technology development programs that pinpoint technologies as well as tailored human and physical infrastructure for specific localities. Within the United States, San Jose/Silicon Valley, Emeryville-Oakland, and San Diego in California; New York City; Cambridge, Massachusetts; Ogden, Utah; Austin, Texas; and the North Carolina Research Triangle were the original technology success stories. The Japanese Technopolis and Sophia Antipolis in France are the best examples of non–North American *technopoles*. These special environments are the focus of many copycat policies aimed at stimulating new advanced technology firms. However, Luger and Goldstein's observation back in 1991 still holds true:

> Research parks will be most successful in helping to stimulate economic development in regions that already are richly endowed with resources that attract highly educated scientists and engineers. This is not to say that regions with less rich endowments cannot have a high technology future, but more basic long-term investments in improving public higher education, environmental quality, and residential opportunities will be needed first. (pp. 183–184)

Empirical evidence has long suggested that advanced technology development is nearly impossible to produce or purchase by traditional industrial incentives such as free land or low taxes (Lowe, 2014; Luger and Goldstein, 1991). Rather, the evidence indicates that advanced technology firms are induced by the region's character. The economic development question is: Is it possible for a community that currently does not have the correct environment to create or stimulate one? In this chapter, we cannot answer this question categorically; however, we can suggest what communities will need at the various stages of technology development to examine and nurture their *innovation and entrepreneurial capacity* to start, retain, and sustain an advanced technology firm environment.

The Technology Development Process

The range of support systems needed to encourage and foster advanced technology development are many and complex. Only a broad list of essential support structures is addressed in this chapter. The basic orientation we take is that the *soft infrastructure* (living amenities, cultural and educational institutions) sustains the *hard infrastructure* (money and physical) rather than the reverse. To plan for advanced technology, one must first understand how the technology process works. There are four stages, and the failure to provide the necessary supports at any one stage may ultimately inhibit the development of new products and industries.

Advanced Technology Regional Choice Model

In what follows, we describe a four-stage advanced technology model. The technology process is cyclical and interactive. Each stage in the process may revert back to or interact with a previous stage. For example, product failure spurs new research or a new phase of innovation. The process has its own support system requirements. In too many instances, the regional policy or program fails to recognize these distinct stages and consequently fails to create the right environment at the right time. The first stage of the technology-based economic development strategy begins with establishing a research base that leads to invention, as described in what follows:

1. *Research base*. Research identifies the basic scientific principles on which new technology industries or products are based. Research may be applied (designed to solve specific problems or have an application for a field of technology) or generic (nonspecific research in areas of continuing pertinence for a business enterprise). Targeted research may be market driven, guided by the knowledge of market requirements, or technology driven, guided by perceived capabilities of specific technology. Each field of research will also have its own peculiar support system. Most generic research is performed at national universities or laboratories, mainly with government funding. Most applied research is performed at large industrial labs. Many university communities have a set of research institutions with both the generic and applied/firm-based institutions. The communications or networks among research firms serve as the real incubators in economic development (Blakely and Nishikawa, 1992).
2. *Invention*. Inventions are products that may or may not arise directly from research. Often, they result from ideas that help to improve an operation's efficiency. In many cases, gadgets, devices, or programs

are the result of invention. These are eventually developed and refined as new-technology products. A technology milieu creates an environment that stimulates more invention. Moreover, it is important to have in place organizations to assist in patent handling as well as creative financing in the community. It is no accident that Silicon Valley developed near San Francisco. The San Francisco area has a very strong venture capital base and excellent legal services for scientists.

3. *Adaptation and development.* Adaptations result from research or invention modifying or improving existing technology. Modifications of software, for example, improve the operation's efficiency. During product development, ideas, research principles, inventions, and adaptations are translated into an actual product. Prototype tests or models are built to evaluate the performance, application, and feasibility of developing the product to a commercial level. More detailed feasibility studies and some market research will be undertaken. Communities and regions can assist in the adaptation and development process by providing actual incubator facilities and creating technology or manufacturing zones so that firms can find suitable space for their initial operations.
4. *Innovation and dissemination.* The fourth stage in the process involves the commercialization of a new product or process. A firm will decide to develop the product to manufacture or sell the design to another firm for manufacturing. If it decides to manufacture, the firm may enter into a joint venture or other production arrangements. Marketing, venture capital finance, and entrepreneurs will be important in the innovation and dissemination stage.

These first three stages in the technology process all represent investment costs. Through the manufacture or sale of new technology, a company should produce a return and recoup the cost of the product's creation. Production is the fourth and final stage of the process. Larger companies that have purchased or developed a high-tech product will manufacture and distribute it. Other companies will disseminate the production of components to subsidiaries to produce, for instance, chips and circuits. Constant marketing and monitoring of the product are essential during the production stage. Regular feedback to research and development (R&D) and marketing is essential in order to continue to improve a product or terminate the production before it reaches the end of the technology life cycle.

To facilitate the development process, a community has to provide "places to meet." These places range from convention centers to restaurants and theater areas. This soft infrastructure can be as important as physical roads, sewers, and special industrial parks.

Fostering the Advanced Technology Community

Creating an environment that maximizes information exchange, face-to-face communications, and the formation of strategic relationships is key to successful advanced technology development. These networks or channels of both information and exchange of capital and expertise form the nucleus for the other physical, social, economic, and environmental systems needed to support advanced technology industrial development.

Human Resources

Human resources, in terms of skills, know-how, and entrepreneurship, are essential for advanced technology development. Most people involved in the research phase of development will have postbaccalaureate degrees and often will have multidisciplinary skills.

Social skills in dealing effectively with people from a variety of cultures and foreign languages are essential in globally based enterprises. These skills develop as the result of peer group association and interaction during forums of scientific and social interest. One of the hallmarks of Silicon Valley has been the high level of social interaction that naturally developed between scientists in one locality. Local economic development efforts to replicate this innovation-nurturing social interaction have been widespread in the public and private sectors. For example, Microsoft is partnering with cities to create the Microsoft Innovation Center (MIC), which provides training to the technology community and hosts networking events. In Atlanta, MIC is colocated with flex working space, a women's entrepreneurship organization, and a university innovation center.

During the development and dissemination phase, a critical resource is the marketing department. Social entrepreneurial skills are an essential link between product development and production capital. Trained financial marketing depends on a human resource support system that can promote the products and bring in the venture capital. Special marketing, finance, and management skills are required in the final stage of the technology process, when a product is manufactured.

Advanced technology regions have been characterized by a high degree of employment mobility. This is partly due to the rapidly changing nature and high failure rates of technology enterprises. In addition, many individuals do not want to be bound to companies and prefer contractual or project-based employment. Many businesses look upon this favorably, as it reduces problems with staff retrenchments in economic downturns or at the end of technology life cycles. This mobility also supports the transfer of ideas and innovation.

Education and Research Facilities

Another important support system for advanced technology development is the presence of a university or technical institute of international standing that provides STEM (science, technology, engineering, and math) education and research. Evidence from studies carried out in the United States and elsewhere suggests that universities play a direct role in generating advanced technology research. Further, their affiliated research institutes, often with a specialized focus, emphasize applied research and can be major catalysts for advanced technology development. Stanford Research Institute, for example, was one of the important ingredients in propelling the original high-tech development in Silicon Valley, California. Such institutes might be privately or publicly funded and may consist of one or more centers.

Just as important as these institutes are research laboratories and incubator establishments like Bell Laboratories and the Wang Research Institute, which can be tied to major companies. There is a tendency for major companies to form, or parcel out, work to subsidiary companies whose activities specifically involve R&D. Government research centers are also important in this process. Many are involved with basic research leading to new discoveries.

Although universities, research institutes, and laboratories perform an important educational function in the process of technology development, strong support is essential at the secondary education level to ensure a supply of future research scientists, innovators, and technical workers. Students at high schools require strong basic math and science skills, digital literacy, and some training in research methods to gain employment in technology-based enterprises (Leigh and Walcott, 2003).

Environmental Quality and Community Amenities

The quality of the environment and its natural resources can have a significant effect on whether an individual chooses to live in one locality or another. Experience throughout the world indicates that personnel involved in R&D choose to live in high-quality residential environments with good amenities as well as cultural, commercial, and educational facilities.

Business and Support Institutions

Although universities and research institutes play a significant role in promoting new advanced technology–based enterprises, major corporations and institutions that have R&D sections attached to their operations also can stimulate growth and clustering of technology industries. Many large

American companies have defense contracts, which have been the principal stimulus behind numerous advanced technology developments. Other companies in the pharmaceutical, medical, chemical, bio- and nanotechnology fields have generated spin-offs of advanced technology enterprises.

Many state and local governments recruit technology branch plants as the basis for forming an advanced technology economic base under the (mistaken) belief that new firms will emerge from these branch operations and establish headquarters in their locality. Research indicates there is very little spin-off of new firms away from the research headquarters' locations (with the exception of software development). If a company moves its headquarters or a major division and product lines to a community, it usually continues to use its own internal support systems for servicing the branch operations.

However, a community that successfully implements a strategy of incubating or starting small tech firms may be able to create an agglomeration of technology industries within the region or locality. When this occurs, the multiplier effect of technology development is significant since R&D businesses pick up contracts from these larger companies.

Small companies are part of the technology life cycle of product development. Many never survive to grow into large firms and instead become part of larger operations. This has been a fundamental growth strategy of many information technology (IT)–based firms, including Amazon, Apple, Google, and Microsoft.

There is a trend in recent years to establish innovation centers to encourage the development of small-scale businesses involved in advanced technology. Many of these have failed partly because they were too far removed from the major businesses they served. Innovation centers are more likely to succeed when located close to major users or developers of advanced technology products and research institutions.

The importance of institutions as catalysts for advanced technology development has often been overlooked in the belief that the greatest spin-offs come from corporations. Medicine is one of the sciences in which research is expanding rapidly; hospitals are a base for much of that research. As hospitals become more specialized, there is a greater need for more precise instruments, drugs, vaccines, and equipment. Advanced technology firms have considerable opportunities to take advantage of these institutions' needs.

Government institutions that are catalysts for advanced technology are telecommunications, government science laboratories, agriculture and marine research centers, defense, and administrative services. The last group is becoming increasingly dependent on substantial data storage and retrieval systems and processing. The obvious benefits of defense institutions are well documented, but the opportunities to develop advanced technology industries that serve the special requirements of other government institutions are numerous.

Enterprise or Incubator Facilities

Enterprise facilities describe the buildings, areas, or estates necessary to carry out business associated with advanced technology. Some of these can be developed as part of other support systems—for example, universities, research institutes, research laboratories, and innovation and conference centers.

There are five specialized development areas that can house new businesses: (1) research parks, (2) science parks, (3) technology parks, (4) business parks, and (5) high-quality industrial parks. Their typical forms are described next. Historically, these forms have been located in suburban areas, but increasingly, they are also locating within revitalized areas of cities.

1. *Research park*. A high-quality, low-density physical development in a parklike setting, there is significant interaction between academics, researchers involved in research and product development, and commercial organizations and entrepreneurs.
2. *Science park*. An innovation center containing R&D enterprises, a science park can also include light industrial production relating to scientific research and appropriate ancillary services.
3. *Technology park*. This is a collection of advanced technology industries concerned with both research and production, located in attractive, well-landscaped surroundings and situated within a reasonable service area of a STEM university or major institute.
4. *Business park*. A prestigious environment, suitable for a wide range of activities, including manufacturing, assembly, sales, and other office-based activities. There is no requirement for these parks to be close to academic institutions.
5. *High-quality industrial park*. These parks have attractive features for certain forms of contemporary light industry.

There are many benefits to be gained by new industries being located in specialized, well-marked facilities—namely, good services, shared facilities, a high-quality environment, and flexible planning conditions.

Advanced technology workers expect quality entertainment, dining, and retail outlets. These outlets are also important in developing associations between people involved in R&D and advanced technology industries. These associations allow ideas to be expressed on an informal basis and help circulate knowledge.

Because many people involved in the fields of science, research, and development are generally highly paid, most of them expect higher levels of service and are prepared to pay for it. Their demand for high-quality housing and schools is very attractive to communities seeking to raise their level of economic development.

Not all localities can expect to become centers of innovation and advanced technology development. However, every community can better prepare its human resources and incorporate new technologies such as superfast fiber optic networks into its public infrastructure. In so doing, it maximizes its ability to stay competitive in the New Economy.

With broader acceptance of climate challenges and smart growth goals, we can expect the typical greenfield location and low-density development patterns of the four types described previously to be altered in the future. Indeed, in the future, the most innovative research and business activities may be expected to seek out parks and facilities that meet the physical standards of sustainable development. For example, a June 2008 joint conference of the Association of University Research Parks (AURP) and the Biotechnology Industry Organization (BIO) Council of Biotechnology Centers featured a session titled "Innovation: Green From the Ground Up," which focused on creating LEED (Leadership in Energy and Environmental Design)-certified green research parks (AURP, 2008). The LEED rating system developed by the U.S. Green Building Council (USGBC) for the research park infrastructure and research centers requires the use of construction materials that are renewable, do not harm the environment, and use less energy than those found in conventional construction. Auburn University, the University of Virginia, Boston University, and many other universities have adopted green building and infrastructure for their research parks and buildings.

Globalization is rapidly changing the prospects for advanced technology local economic development strategies in the United States and other advanced industrialized nations. The outsourcing of tech jobs to India and elsewhere that was discussed in the opening chapter of this book has been viewed as a significant threat to these strategies. At the same time, "reshoring," or the bringing back of jobs to the United States, has been occurring in a number of firms because of dissatisfaction with outsourced performance or conditions becoming more competitive in the United States. What the long-term balance between outsourced or reshored (i.e., domestic) jobs will be is unknown—and so are the impacts on U.S. local economic development. However, what is clear is that strong school systems from prekindergarten through university are essential to maintain a competitive position in the global economy. The reason U.S. firms can outsource research and analytical jobs to India is because India has a large supply of well-educated research scientists and other professions who receive a fraction of the compensation of their U.S. counterparts. Of course, it is technology in the form of advanced communications and logistics systems that allows the export of some of the most advanced employment for developing technology and new innovations.

Advanced Manufacturing and Clean Technology

In recent years, advanced technology is increasingly being deployed to transform manufacturing and to shift all sectors of the economy to cleaner or greener production and processes. The federal government has taken concerted steps to promote advanced manufacturing, which it defines as the following:

> A family of activities that (a) depend on the use and coordination of information, automation, computation, software, sensing, and networking, and/or (b) make use of cutting-edge materials and emerging capabilities enabled by the physical and biological sciences, for example nanotechnology, chemistry, and biology. This involves both new ways to manufacture existing products, and especially the manufacture of new products emerging from new advanced technologies. (www.manufacturing.gov)

One of the more notable U.S. presidential policy shifts for economic development has been the Obama administration's stance that "the nation's long-term ability to innovate and compete in the global economy greatly benefits from co-location of manufacturing and manufacturing-related R&D activities in the United States" (www.manufacturing.gov). This leadership at the national level can be seen as a clear rejection of the idea that advanced economies are postindustrial or service economies. Going back to the fundamentals for local economic development planning that contribute to stability and resiliency (the latter to be discussed in detail later in this chapter), an advanced economy should have a diverse composition of leading industrial and service sectors.

To remain globally competitive, it will also be necessary for advanced manufacturing to contribute to the growing expectations of the international green economy. The U.S. Department of Commerce has a "sustainable manufacturing" program that encourages industrial processes and products that conserve natural resources and generate less pollution. The national network of Manufacturing Extension Partnerships helps smaller manufacturers with innovation and competiveness in emerging sustainable industries.

The Organisation for Economic Co-operation and Development (OECD), made up of 35 countries, including the United States, has developed a sustainable manufacturing index and guidebook to help firms become more sustainable. The index and guidebook are also useful to economic developers seeking to promote more sustainable production activity in their communities. There are 18 indicators identified that are grouped into three key areas of manufacturing: (1) inputs, (2) operations, and (3) products (see Table 14.1).

Table 14.1 Sustainable Manufacturing Indicators Specified by the Organisation for Economic Co-operation and Development

Inputs	Operations	Products
Non-renewable materials intensity	Water intensity	Recycled/reused content
Restricted substances intensity	Energy intensity	Recyclability
Recycled/reused content	Renewable proportion of energy	Renewable materials content
	Greenhouse gas intensity	Non-renewable materials intensity
	Residuals Intensity	Restricted substances content
	Air releases intensity	Energy consumption intensity
	Water releases intensity	Greenhouse gas emissions intensity
	Proportion of natural land	

Source: OECD Sustainable Manufacturing Indicators. http://www.oecd.org/document/48/0,3746,en_21571361_47075996_47855728_1_1_1_1,00.html.

The move toward the green economy will naturally have an impact on the workforce, and local economic development efforts are increasingly focusing on creating green jobs. The U.S. Department of Labor defines green jobs to be those "in businesses that produce goods or provide services that benefit the environment or conserve natural resources."

Manufacturing typically offers above-average pay and benefits to workers with a wide range of skills and job titles. This should particularly be the case for advanced manufacturing jobs. However, the U.S. industrial workforce has significant skill gaps and is also rapidly aging, making it difficult for employers to fill jobs in emerging advanced and/or sustainable industries. Compounding the problem are surveys that found parents generally do not want their children working in manufacturing. Unless this is corrected through workforce strategies that promote manufacturing as a career option, local economic developers will have great difficulty helping their community either grow an advanced manufacturing firm from a local invention or attract one from elsewhere (Hoelzel and Leigh, 2012).

An additional critical challenge for local economic developers seeking to foster advanced and sustainable industry in their communities stems

from what has often been a contentious relationship between industry and communities as well as pressures to convert existing industrial land to residential and commercial uses. The negative image of industry held in many communities is largely associated with traditional industry, which, for good reason, was kept separate from residential and commercial development. Today's industry is cleaner and has a lighter imprint on the land, but attitudes and land use regulations are slow to take this into account. Consequently, opportunities for economic development are being missed. However, there are some forward-thinking cities in the United States (notably Brooklyn, New York; San Francisco, California; Seattle, Washington; Chicago, Illinois; Minneapolis, Minnesota; and Philadelphia, Pennsylvania) that are adopting proactive policies to retain industrial land that economic developers can learn from (Hoelzel and Leigh, 2012; Leigh et al., 2014).

Resiliency in Local Economic Development

The economic and environmental crises of U.S. cities in recent years have generated a growing planning and policy focus on resiliency in economic development as well as other aspects of city systems. The increasing use of phrases such as *the resilient economy* or *resilient city* or *resilient region* may give the impression that this is a term and a movement that supercedes efforts to create the sustainable economy or city or region. We take the view that these are not competing terms or efforts; rather, resiliency is a framework nested within that of a larger framework of sustainability. That is, recalling the definition of sustainable local economic development (SLED) upon which this book is based, we pursue SLED to preserve and raise the standard of living through a process of human and physical development based on principles of equity and sustainability. This requires achieving a minimum standard of living for all that increases over time while reducing inequality and fostering environmentally benign resource use and production. *Resiliency* has been defined as "the capacity of a region to respond effectively to a shock, such as the effects of realigning or declining industries, a national economic recession, or a natural disaster" (U.S. Department of Housing and Urban Development [HUD], 2012). If the local economy or region is truly resilient, then its standard of living, levels of equality, and environmentally benign resource use and production will not be diminished by any major economic shock or extreme weather event.

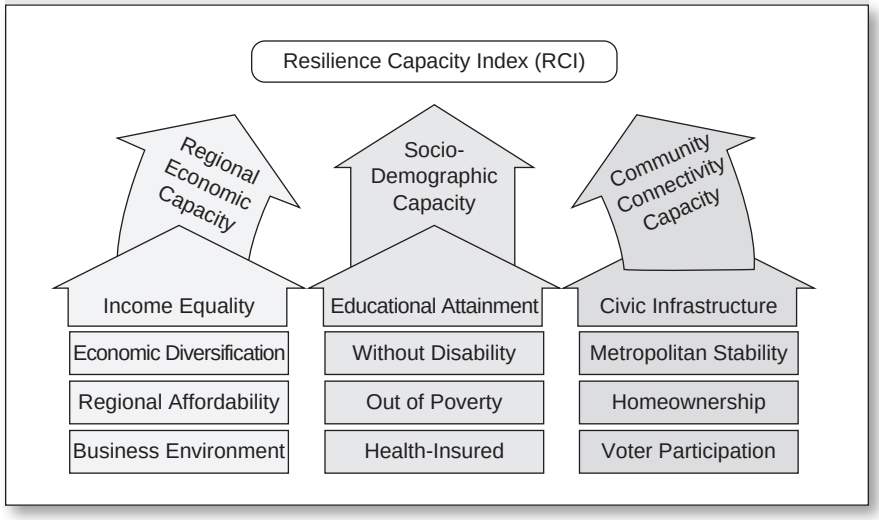
In a major initiative focused on building resilient regions funded by the MacArthur Foundation, significant analyses have been made of the kinds of shock that can occur and how specific characteristics of regional or local

economies affect their ability to recover. Hill and colleagues (2011) delineated three causes of economic shock. They can be due to (1) downturns in the national economy, (2) downturns in particular industries that constitute an important component of the local economy's export base, or (3) other external events (i.e., natural disaster, military base closure, exit of a major firm). Hill and colleagues (2011) defined whether an economy demonstrates resilience or nonresilience to a shock as follows: "A region is *resilient* if, within four years of the onset of the downturn, its annual growth rate returns to the eight-year growth rate prior to the year the downturn occurred. If it does not do so within four years, we term it *nonresilient*" (p. 7).

Hill and company's (2011) analysis of metropolitan regional economies yielded a number of important findings for local economic development—four of which are highlighted here. First, while economies with a higher proportion of employment in durable goods manufacturing tend to experience more downturns and to be less shock resistant, they also demonstrate resilience more quickly. Second, economies are more shock resistant when they have greater numbers of major export industries and when they have greater industrial diversity. Third, economies that are less shock resistant have lower average education levels (high school degree or less). And fourth, economies with higher income inequality experience more downturns and take longer to recover.

In other research associated with the Building Resilient Regions initiative, Kathryn Foster, author of Figure 14.1, developed a Resilience Capacity Index (RCI) that ranked 361 metro areas using 12 indicators in three capacity categories: regional economic, sociodemographic, and community connectivity. Of the three categories depicted in Figure 14.1, we will explore in more depth those under the *regional economic capacity* category: income equality, economic diversification, regional affordability, and business environment. Income equality is included in the index because regions that have more equal distribution of economic resources are hypothesized to respond more cohesively to shock (Cutter et al., 2010). Economic diversification is included because having economic activity spread more widely across industrial sectors means that business cycle impacts or industry shocks are lessened. The regional affordability indicator measures the proportion of an economy's households that pay more than 35% of their income on housing. Housing cost exceeding 35% of income is typically thought of as excessive (e.g., homebuyers generally cannot obtain mortgages when payments would exceed 35% of their income) and suggests the household would have less spending and investment flexibility during a crisis. The business environment indicator seeks to capture how economically dynamic an economy is,

Figure 14.1 Resilience Capacity Index (RCI)



Source: Kathryn A. Foster, University at Buffalo Regional Institute and MacArthur Foundation Research Network on Building Resilient Regions. *Graphic design by Beuving Creative, Inc.*

with greater dynamism associated with factors such as higher proportions of small businesses, high levels of business churn (starts and stops), and residential high-speed Internet connections.

Having discussed economic development characteristics associated with resiliency, the next section focuses on what local economic development planning can do to promote resiliency after an environmental or economic crisis.

Local Economic Development Planning for Resiliency

A key role for economic developers is that of helping communities adjust to the economic changes that are causing or may cause serious structural damage to their underlying economic base. These changes may occur overnight or over a long period of time and result from industrial or corporate restructuring, new federal laws and regulations, reductions in defense expenditures, and depletion of natural resources or natural disasters. On top of this, as the recent past showed, local economies can be negatively impacted by institutional and international monetary missteps well beyond their control. For

example, as was discussed previously in this book, the U.S. Federal Reserve's loosening of oversight and requirements for the home mortgage industry caused a subprime mortgage crisis that became international in scope while deeply affecting individual homeowners, local finance institutions, entire neighborhoods, and cities.

Because of the national dependency on oil to run the United States and other national economies, jumps in its price can raise the cost of doing business and moving goods and people in the economy to hardship levels in many communities. As petroleum is the basic input into the plastics and related industries, it is an essential input to much of what modern society consumes. Hence, unprecedented inflation in the basic consumer basket also began to accompany the subprime financial market collapse when fuel prices were also rising. While oil and gas prices subsequently fell due to growth in U.S. oil shale resources, supported by shifts in federal policy ($3.62 in 2013 compared to $2.45 in 2015, constant prices), the decline in prices is temporary. Communities should not lose sight of the fact that substantial increases in the cost of oil and gas threaten the middle-class lifestyle and create particular hardships for working-class families. Shifting to a greener, less petroleum-dependent economy now will ensure that the preview of what rapidly escalating prices can do to our national and local economies won't turn into a long-running nightmare.

If local communities have not already created a resiliency plan, let us hope the Great Recession and recent environmental disasters around the world will motivate them to do so, thereby helping to protect them from negative impacts of future economic and societal changes.

The Centre for Community Enterprise (2001) defines a resilient community as one that "takes intentional action to enhance the personal and collective capacity of its citizens to respond and influence the course of social and economic change" (p. 5). It has identified 23 characteristics of resilient communities that fall into four major categories: (1) people, (2) organizations, (3) resources, and (4) community process (see Table 14.2).

That local businesses have a great stake in creating community resiliency is persuasively argued by David Honour, editor of *Continuity Central* (see Economic Developments 14.1). Continuity planning is an activity in which businesses engage to enable the resumption of critical functions when a disaster or other disruption is experienced. Businesses should see community resiliency planning as an extension of their continuity planning because much of their success is dependent on a well-functioning community. Thus, businesses and local government and other economic development actors should view each other as important allies working together to create and implement community resiliency plans.

Table 14.2 Characteristics of Resilient Communities

People
1. Leadership is representative of the community. 2. Elected community leadership is visionary, shares power, and builds consensus. 3. Community members are involved in significant community decisions. 4. The community feels a sense of pride. 5. People feel optimistic about the future of the community. 6. There is a spirit of mutual assistance and cooperation in the community. 7. People feel a sense of attachment to their community. 8. The community is self-reliant and looks to itself and its own resources to address major issues. 9. There is a strong belief in and support for education at all levels.
Organizations
10. There are a variety of community economic development (CED) organizations in the community such that the key CED functions are well served. 11. Organizations in the community have developed partnerships and collaborative working relationships.
Resources
12. Employment in the community is diversified beyond a single large employer. 13. Major employers in the community are locally owned. 14. The community has a strategy for increasing independent local ownership. 15. There is openness to alternative ways of earning a living and economic activity. 16. The community looks outside itself to seek and secure resources (skills, expertise, and finance) that will address identified areas of weakness. 17. The community is aware of its competitive position in the broader economy.
Community Process
18. The community has a community economic development plan that guides its development. 19. Citizens are involved in the creation and implementation of the community vision and goals. 20. There is ongoing action toward achieving the goals in the CED plan. 21. There is regular evaluation of progress toward the community's strategic goals. 22. Organizations use the CED plan to guide their actions. 23. The community adopts a development approach that encompasses all segments of the population.

ECONOMIC DEVELOPMENTS 14.1
A Path Toward More Resilient Cities*

In 2012, Superstorm Sandy came barreling across the Eastern Seaboard, devastating large portions of coastal New York and New Jersey. Approximately 305,000 housing units in New York City were either damaged or destroyed, and total costs to the city were estimated at $19 billion. The New York City neighborhoods most impacted by the hurricane were in southern Manhattan, southern Brooklyn, South Queens, the East and South Shores of Staten Island, and the Brooklyn-Queens Waterfront, many of which had already experienced economic decline prior to the storm. Floodwaters forced approximately 18,000 businesses to close their doors either temporarily or for good, affecting more than 200,000 employees (New York City Economic Development Corporation [NYCEDC], 2013).

In 2013, the NYCEDC initiated the "Neighborhood Game-Changer Investment Competition" that would award up to $18 million to individual neighborhoods for innovative capital-intensive projects. The award money, funded by federal Community Development Block Grants (CDBGs) for Disaster Relief, encouraged private businesses and nonprofit organizations to submit project ideas that would spur long-term economic growth, while being tailored to a specific neighborhood's needs.

Applications were submitted and the NYCEDC spent over a year reviewing them. Then Mayor Bill de Blasio took office in January 2014 and announced that the game-changer competition was not the most effective way to spend federal relief funds. Part of the money was reallocated toward "Resiliency Innovations for a Stronger Economy" (RISE), a new NYCEDC competition to entice companies and organizations to apply resilient technologies to the city's more vulnerable areas (Boyle, 2015). In May 2015, $30 million was divided among 11 winning teams to install their technologies in small businesses impacted by Hurricane Sandy.

The winners represented three technology sectors: (1) energy, (2) telecom networks, and (3) building systems. Indiana-based Go Electric will implement an Energy Resiliency System that provides continuous electric power during outages. The Red Hook Initiative will expand its mesh wireless network to small businesses impacted by Hurricane Sandy in the Brooklyn-based Red Hook neighborhood. Young adults from Red Hook designed the project and now train and employ others from the neighborhood to retain financial resources and jobs within the community. A consortium of firms headed by F. William Brown in Connecticut will install Sandwich Plate System flood panels that prevent water infiltration in small businesses. The RISE program comes from Mayor de Blasio's larger plan to retrofit public and private buildings with green and innovative technologies that reduce New York City's large carbon footprint (NYCEDC, 2015).

Seven years prior to Sandy, in 2005, Hurricane Katrina's destructive force relocated 1.5 million residents and created $100 billion in damage. Today, New Orleans and the Louisiana Gulf Coast region have been become models for climate change adaptation planning thanks to several innovative and collaborative strategies. First,

federal funding has provided more than $14 billion to rebuild the levees and other flood resilient technologies. This has resulted in 133 miles of new construction and 100-year flood protection against flood levels that have a 1% chance of occurring in any one year (Sheppard, 2015).

In December 2005, the state of Louisiana created the Coastal Protection and Restoration Authority (CPRA) to unify coastal storm protection efforts under one agency. CPRA submits publicly and privately funded flood resiliency and restoration plans to the state legislature each year. Perhaps the most important collaborative project of the CPRA thus far is the "state coastal master plan," first created in 2007, and updated every 5 years. The 2012 update includes 109 coastal protection and restoration projects totaling $50 billion over 50 years.

The 2012 redevelopment update also includes "nonstructural" flood mitigation projects as alternatives to traditional systems such as levees designed to keep water out of an area. The nonstructural approaches, labeled "Living With Water" by New Orleans architects, are based on Dutch methods to adapt buildings and other infrastructure to accommodate water. Accommodations, including home elevation, flood and storm proofing, flood insurance, and public education about storm safety and response, are thought to be more cost effective than the traditional structural approaches (Jackson, 2012) and to be more beneficial to resource-stricken rural coastal regions. For instance, Terrebonne Parish in southern, rural Louisiana applied for and received grants from the Federal Emergency Management Agency (FEMA) and elevated more than 1,000 homes (Sheppard, 2015). However, leveraging state and federal funds to pay for these projects is not always feasible, so these types of successful nonstructural mitigation projects have been piecemeal so far.

The state coastal master plan also includes wide-scale wetland restoration efforts. According to a U.S. Geological Survey (Schleifstein, 2011), Louisiana's coastline is losing more than a football field of wetlands every hour and has one of the world's highest rates of rising sea levels. However, as a result of the Department of Justice's $18.7 billion settlement with BP for the devastating 2010 oil spill in the Gulf of Mexico, Louisiana will see a portion of that money go toward coastal wetlands restoration (Sheppard, 2015).

A joint effort between the city of New Orleans and the Rockefeller Foundation's 100 Resilient Cities Initiative has generated funding to hire a "chief resilience officer" and create a recently released policy agenda aptly named "Resilient New Orleans." The multifaceted plan depends on public and private partnerships to fund and develop 41 proposed strategies related to the environment, city services, and social and economic equity. Proposals include developing a new regional transit system, establishing a savings-matching program for low-income citizens to maintain emergency funds, and improving the city's storm water drainage system. The plan also proposes opening a Resilience Center as a research and innovation hub for flood mitigation technologies. The Resilient New Orleans plan will support efforts underway over the past decade to build up the region's resiliency through

(Continued)

(Continued)

nonstructural approaches such as home elevation, flood insurance, and targeted planning and zoning measures (Jackson, 2012). For instance, the Network for Economic Opportunity, which connects unemployed residents to training and job opportunities, also will benefit from the plan's resources (Kinney, 2015). The plan promotes the goal of the region becoming a global business hub for water and environmental services firms (City of New Orleans, 2015).

Both RISE : NYC and the state of Louisiana's regional efforts have resulted in innovative programs where the goal of resiliency is more than protecting against future natural disasters. Instead, resiliency includes strengthening communities and business through strategies that prioritize equity along with social, economic, and environmental sustainability.

*Research assistance provided by Ashley Bozarth.

The 2005 devastation of New Orleans and the Gulf Coast by Hurricanes Katrina and Rita; the 2011 tornado-driven havoc that Joplin, Missouri, and many midwestern and southern communities experienced; and Hurricane Sandy, which hit New Jersey and New York City in 2012, illustrate the difficulties and complexities of the disaster-recovery process. They also show how much better prepared for recovery communities could be by engaging in predisaster or resiliency planning. Plans need to be tailored to the nature of the disaster that one may reasonably foresee for a community—that is, a plan for a possible tornado in the Midwest may look very different than for a possible hurricane on the Gulf Coast. Further, there is a range of disasters for which the community should proactively plan to minimize impacts on economic development, for example, water shortages, company closings, or terrorist attacks.

The economic portion of the plan will also vary significantly from community to community, because it should be developed to address the specific needs of the local economy as defined by area businesses and infrastructure assets of critical importance to the economy. For example, by building into the local business retention and expansion database information about suppliers and distributors, the local economic development organization has the needed information to facilitate employers rebuilding these networks in the aftermath of a disaster.

Having the ability to do so brings to the forefront one of the key preparedness factors to facilitate recovery: availability of data and contact information. In addition to encouraging their local businesses to do so, part of disaster preparedness is the economic development organizations themselves backing up all data to a site outside of the immediate area—recommendations have been made for distances as far as 500 miles away, which can be accomplished

by using an Internet cloud data-storage service—so that this information can be accessed in the immediate aftermath. Included in the economic development organization's off-site data backup should be local businesses' contact information and physical addresses. Even when using a cloud, redundancies in backup locations provide even greater protection.

Joplin, Missouri, was hit by an EF5 multiple-vortex tornado on May 22, 2011, with winds over 200 miles per hour. It left 161 dead and destroyed more than 7,000 homes and nearly 550 businesses as well as key institutions. A year after the tornado hit, 429 of the businesses that were either destroyed or damaged were up and running. The Joplin Area Chamber of Commerce partially attributes its community's successful reopening of about 80% of its businesses to the organizational continuity planning the chamber engaged in prior to the May 22, 2011, tornado. Within 3 weeks of the tornado, the chamber staff was able to make contact with all 530 employers by walking the streets (facilitated by added capacity from volunteers from other chambers in the region). This provided businesses with a sense of someone being in charge and committed to their individual business and overall community economic recovery, fueling the optimism needed to rebuild. Further, part of the chamber's planning included designating emergency meeting locations, which it used along with SMS text messages to reconnect to employees and key local business owners. By being accessible to area businesses, the chamber could be a source of reliable information regarding utilities, cleanup and rebuilding, and business services, which reinforced confidence for rebuilding. If the chamber had not planned for its own organizational continuity, it may not have been as well positioned to facilitate that 80% rebuild rate (Wellemeyer, 2012).

The impact of having a positive, unified voice of leadership for rebuilding can be highly effective, as Charleston, South Carolina, found in the aftermath of 1989's Hurricane Hugo. The decision by President Harry Lightsey to open the College of Charleston just 7 days after the hurricane was met with skepticism but soon thereafter—and over 25 years later—continues to be cited as having had an important positive psychological impact for rebuilding (Graham, n.d.).

The International Economic Development Council (IEDC) was an early entry in the growing awareness of predisaster planning, specifically with regard to planning for economic recovery, as it immediately stepped in to provide support to its members and peers in the Gulf Coast in 2005 (see www.restoreyoureconomy.org). What began as a peer-to-peer volunteer effort evolved into a wider effort of educating economic development professionals regarding the importance of advancing disaster preparedness and postdisaster economic recovery planning. Additional organizations engaged in supporting predisaster planning activities include Community and Regional Resilience

Institute (CARRI), the National Association of Development Organizations (NADO), Business Civic Leadership Center (BCLC), and the Association of Chamber of Commerce Executives (ACCE).

The efforts of both the IEDC and its partners have resulted in the outline of a framework for predisaster planning. Not just the plan but the process itself should be tailored to the community and inclusive of all the relevant stakeholder groups for economic development—that is, representatives of local government; employers; business service providers; economic assets (e.g., the local airport and prominent tourist destinations); infrastructure (roads, water, sewer, electric, telecommunications, etc.); workforce development (K–12 and higher education); hospitals and other large health care providers; and local lending institutions, foundations, and other organizations that can be a source of loans or grants for planning or recovering activities.

As outlined by the IEDC, the planning process for preparing for disaster is best focused on the following:

1. Clarifying roles and responsibilities both in the planning and recovery phases
2. Developing an understanding of economic assets and their potential vulnerabilities and strategic actions to shore up those vulnerabilities predisaster and address them postdisaster
3. Writing a clear communications plan and contact information backed up in an Internet cloud or other off-site location
4. Identifying and then making available a list of identified funding and support systems at the federal, state, regional, and local levels
5. Integrating this plan with other relevant community plans and regularly revisiting and updating the plan, contact list, and funding and support system list. [1]

Through the RestoreYourEconomy.org website, IEDC has also provided recommendations in the areas of engaging businesses in their own continuity or disaster-preparedness planning, building capacity to support recovery, and developing business-recovery financing options as well as redevelopment planning (including land use and building code considerations) and workforce planning (including housing, training, retention, and transportation considerations). These activities could also be built into a predisaster planning process.

There are so many business recovery needs to address in predisaster planning—for example, capital, infrastructure, workforce, customers, technical assistance, and insurance—that the process can be overwhelming. With limited funding and time capacity to engage in proactive planning, it

PLED PROBLEM SOLVING 14.1
Community Resilience: The Next Stage in Business Community Thinking?

Companies and entities that are new to business continuity often focus their efforts solely within the boundaries of their organization. As their business continuity arrangements mature, their horizon expands to include supply chain vulnerabilities and any threats posed by the activities of other companies located close by. This is where many business continuity managers stop. But there is a further dimension to business continuity planning that the profession's innovators are starting to consider: the importance of community resilience.

No business exists in a vacuum; it has dependencies on its local community. Employees, suppliers, and customers may all come from the local area. The availability of all critical infrastructures is dependent on the local "last mile." If the community is impacted, then the business is also impacted. Good business continuity planning, therefore, needs to take into account dependencies in the local community and, for self-preservation rather than for altruistic reasons, needs to become involved in helping enhance the resilience of the local community.

There is a temptation for businesses to see community resilience as solely the role of the local authorities and emergency services. After all, these bodies have the statutory responsibility for emergency planning and disaster response. However, in a wide-area disaster, your company will be just one of many voices clamoring for help, and you will have no guarantee of assistance in time to meet your recovery time objectives. For an initial period, at least, communities often need to support themselves in times of disaster, and such self-help is much more likely to be effective if some level of planning has taken place.

The first step is to determine what makes up the local community for your organization. This will have different layers, each layer presenting different risk levels and therefore requiring more or less input and effort.

For example, if a business leases an office in a tenanted building in a business park on the outskirts of a town, it may have the following layers to its local community:

- *The building layer.* The community of other businesses that share the premises with it
- *The business park layer.* The community of other enterprises that are located in the immediate vicinity
- *The surrounding suburb*
- *The town*

The next step is to determine the stakeholders and community groups that you will need to work with within each layer.

(Continued)

(Continued)

After this, you can begin to take positive measures. These could include the following:

1. Working alongside local authority planners to support business continuity awareness and education among other businesses in the community
2. Creating a local business resilience group and inviting other local businesses to join. Joint activities could include the following:
   - Having regular forums to discuss business continuity and share ideas
   - Conducting tests and exercises
   - Carrying out a community risk assessment and building inventory assessment. This may bring up new threats that you were previously unaware of.
   - Making a group subscription to work-area recovery space
   - Agreeing to share a mobile recovery facility in the event of a disaster
   - Jointly funding a business continuity consultant to provide services to the group members or to provide group training sessions

   On a more ambitious level, the local business resilience group could do the following joint activities:

   - Building and managing its own local recovery center
   - Being an effective forum to liaise with local first responders about emergency credentialing, agreeing in advance which staff can enter a police cordon, and providing appropriate ID and training for these people
   - Developing a joint local business continuity information and emergency communications portal. See http://www.continuitycentral.com/news03449.htm for an example of this from the United States.
3. Working with employees in their community setting—for example, making work-area recovery choices based on commuting zones rather than the main office location and enabling resilient home working to prevent transport disruptions from affecting business continuity. This could also include being aware of local incidents, which, while not impacting any company premises, have affected homes and communities of employees. Support could be offered to help with areas such as transport, child care, and rehousing to ensure the well-being of the employees and to enable a rapid return to productivity.
4. If you are a larger company, it may be appropriate to offer the services of your business continuity team as volunteers to support local authorities' business continuity planning activities. These are likely to be stretched for time and budget, and your support may be well received.

As well as making sense from a business continuity point of view, community resilience also fits well into the current trend for companies to take corporate social responsibility (CSR) seriously. CSR is a growing requirement of good reputation management, and, in many countries, medium and large companies are now expected to have a CSR policy. To include community resilience activities within the remit of CSR could be a win-win situation, ensuring that the business is seen to

have the community's needs at heart while at the same time bringing tangible benefits to the business itself.

Source: Adapted from "Community Resilience: The Next Stage in Business Community Thinking?" 2008. *Community Central,* June. © Continuity Central Portal Publishing Ltd.

unfortunately often takes a disaster to motivate predisaster planning for the next one. An economic development organization can take the lead in encouraging preparedness by engaging in its own organizational continuity planning, like the Joplin Area Chamber, and by educating stakeholders and businesses about the much more substantial economic loss that can occur without the preparedness activities.

Conclusion: The Future of Local Economic Development Planning

As stated at the outset of this book, the United States and other advanced nations are enmeshed in the global market system as leaders, followers, and participants. Smart local economic and political decision makers are not surrendering their communities' fate to chance, the marketplace, or unsupportive governmental policies. Growing concern over widening inequality and global warming that accompanied past economic development is galvanizing those who seek sustainable economic development planning, as well as bringing converts from those who engaged in traditional economic development planning and practice. Indeed, the need to focus on equity and inclusivity in economic development has seemed to enter mass consciousness. Why is this the case now?

A recent report from the World Economic Forum offers some insight into our question:

> Since the onset of the financial crisis, the question of how to unlock new sources of productive employment and translate economic growth into broad-based progress in living standards has preoccupied political and business leaders in developed and developing countries alike. (Samans et al., 2015)

But we have to ask what it will take to ensure that the "unlocked" new development translates into broad-based progress. The United Nations Development Programme (2015) argued the following:

> Development can be inclusive—and reduce poverty—only if all groups of people contribute to creating opportunities, share the benefits of development and participate in decision-making. Inclusive development . . . integrates the standards and principles of human rights: participation, non-discrimination and accountability.

However, to ensure that all groups of people are included in the development process requires significant institutional change that, in turn, requires transparency and accountability.[2] Further, achieving this change necessitates convincing a broad public that explicit efforts to reduce inequality actually foster economic growth and development.[3]

The final chapter section of this book discusses four local economic development strategies that practitioners can pursue to foster structural change while promoting greater equity and inclusion. We call these the fundamentals for local economic development planning: entrepreneurial, green, culturally adaptive, and knowledge-based strategies.

Four Strategies to Foster Structural Change in Local Economic Development Planning and Practice

The four strategies to foster structural change can go a long way toward fostering the characteristics of resilient communities that were identified in Table 14.2.

The entrepreneurial strategy focuses on forming local businesses and job creation from within the local economy. This can occur across the wide spectrum of industries within the economy from manufacturing to advanced services to retail. It requires a critical mass of entrepreneurs, strong support networks, and a community ready for change, seeking innovation and willing to take risks (Lichtenstein, Lyons, and Kutzhanova, 2004). The strategy relies on the creation of social and professional networks. These networks connect business owners with service providers as well as grant access to resources, materials, labor, financing, and new markets.

The second local economic development strategy is based on ecofriendly or green development. There are a number of elements that can be found in the ecofriendly strategy, including green business, green building, waste management or diversion business, brownfield redevelopment, greenspace development, ecotourism, and eco-industrial development. These elements provide opportunities for new firm and employment creation, create demands for innovation, and use traditional marketing and recruitment skills aimed at attracting those who prioritize sustainability.

The third economic development strategy focuses on creating a culturally adaptive community. This type of community is one that sees its changing population as a source of assets to capitalize on or seeks to use the arts and culture as an economic development tool. These scenarios are not mutually exclusive. Despite the lack of community support, high housing poverty, poor English skills, and underemployment, ethnic populations have managed to build businesses and communities throughout rural and urban America. They are becoming an essential part of rural communities and central cities, adding children to declining schools, businesses to decaying main streets, and arts to dying towns. The culturally adaptive strategy requires economic developers to tailor traditional small business development approaches to meet the needs of different groups. This can include providing translation of business support materials into appropriate languages, or linking ethnic and minority business to corporate networks that can buy their products or services. Providing targeted workshops, training, and venture capital are other fundamental steps.

The final economic development strategy is the knowledge-based strategy. This strategy prioritizes the development of human capital from early childhood education on, the creation of a skilled labor force, and the fostering of innovation and creativity to spur new businesses and sources of employment. Knowledge-based communities are defined by the specific resources at their disposal. These can include businesses or private sector community members and other community development organizations as well as educational or research institutions, such as universities and colleges. Public–private partnerships are common. A distinguishing characteristic of knowledge-based communities is that they view the educational system not only as a vehicle for labor force development but also as one that can improve equity (School Communities That Work, 2002) and lead to "shared growth" where there is a "broad distribution of opportunities for meaningful participation in the economy and enjoyment of the benefits of an increased standard of living" (Schweke, 2004, p. 3).

The Way Forward

In concluding this book, we cannot overemphasize that these are challenging but exciting times for local economic development planning and practice. Economic developers have a critical role to play in helping communities to respond to the flatter, climate-challenged world. Traditional economic development practice will not be adequate to create sustainable economic development and to counter widening trends of inequality.

In order to serve their communities well, local economic developers will need a deep understanding of the major forces impacting local economies. They will need to hone analytical skills and take advantage of new sources of data and evidence that are rapidly becoming available from nongovernmental sources.[4] Further, local economic developers must direct their efforts to helping communities implement innovative and thoughtful strategies for creating sustainable and resilient economies. To advance SLED, practitioners should use the new data and evidence to evaluate any strategy or project under consideration by three questions: (1) Can it lead to a rising standard of living? (2) Can it reduce inequality between people and/or place? (3) Does it do no harm or, even better, repair the environment? Past evidence clearly shows that we cannot advance from traditional economic development to SLED unless the objectives represented by these questions are explicitly incorporated into our plans, policies, and actions.

Notes

1. This bullet list is adapted from the IEDC manual *Economic Development Strategic Planning*, revised November 2011.

2. We discussed in Chapter 9 one notable institutional change: the GASB Rule 77 that requires reporting of state and local tax incentives. See page 308.

3. See Samans et al. (2015) for a discussion of research evidence showing "that reducing inequality can enhance and strengthen the resilience of growth" (p. 2).

4. For example, real-time labor market data that is being created by private vendors from continual collection of job advertisements or improved business data from online surveying.

About the Authors

Nancey Green Leigh is a professor and PhD program director in the School of City and Regional Planning at the Georgia Institute of Technology. Her economic development planning research and teaching focus on sustainable industrial systems for urban regions, spatial redevelopment, brownfields, employment, and economic justice. She is a former Woodrow Wilson Fellow and Regents Fellow of the University of California and past vice president of the Association of Collegiate Schools of Planning. In 2008, she was elected a Fellow of the American Institute of Certified Planners. In addition to *Planning Local Economic Development*, she is the author of *Stemming Middle-Class Decline: The Challenge to Economic Development Planning* (1994), coauthor of *Economic Revitalization: Cases and Strategies for City and Suburb* (2002), and has published more than 50 articles.

Edward J. Blakely, PhD, is a professor of urban policy in the United States Study Centre at the University of Sydney, Australia. He has held academic positions in teaching, research, academic administration, and economic development policy for more than 30 years, including Dean of the Robert J. Milano Graduate School of Management and Urban Policy and Dean of the University of Southern California School of Policy, Planning, and Development. He is a leading scholar and practitioner in the fields of planning and local economic development. Dr. Blakely served as a policy adviser to the mayor of Oakland and adviser to the Los Angeles Public School District. He was appointed by President Clinton as vice chair of the Presidio Trust, where he played a key role in the development of the former army base into a profitable civic facility. He has served on the board of directors of the American Planning Association, the Nature Conservancy, and the Fulbright Association. In January 2007, Dr. Blakely was appointed by the mayor of New Orleans to head the recovery effort following the devastation of Hurricane Katrina.

Opportunities to Leverage Program Effectiveness via Partnerships
Interagency Network of Enterprise Assistance Providers
April 2012 Meeting Summary

Host
Small Business Administration (SBA)

Purpose of INEAP
Monthly forum where business and technical-assistance program-partnership catalysts meet in support of small businesses to initiate relationships and exchange information across organizational boundaries for the purposes of leveraging public-private resources and promoting innovative activities that accelerate domestic economic development.

Welcome and Opening Remarks

Speakers: Heidi Sheppard, Manufacturing Extension Partnership, National Institute of Standards and Technology, Department of Commerce
Michael Chodos, Office of Entrepreneurial Development, Small Business Administration

Attendees were welcomed to the April 2012 INEAP meeting convened at SBA located at 409 3rd Street, S.W., Washington, D.C. Exchanging information on new Federal program initiatives that support small businesses is a major goal of INEAP. Through this exchange of information, INEAP-member agencies can collaborate on each other's programs.

Small Business Administration, Office of Entrepreneurial Development
Michael Chodos, Associate Administrator for SBA's Office of Entrepreneurial Development, heard about INEAP 2 years ago from Antonio Doss, of SBA and one of the founders of INEAP. Since then, INEAP has come up again and again within the Office of Entrepreneurial Development during conversations involving all levels of collaborations, from grass roots to the Administrator levels within the Federal government. Most importantly, INEAP fosters non-political, directed, real collaboration among dedicated INEAP members in support of small businesses. Mr. Chodos commends INEAP members who are going over and beyond their normal responsibilities:

- To voluntarily be involved with INEAP,
- To share awareness of what is needed and what works within their programs, and
- To determine the most effective way to collaborate with each other's programs.

Mr. Chodos acknowledges the accomplishments and success stories that have evolved from INEAP interactions and looks forward to hearing the collaborative outcomes that result from April's INEAP meeting.

Feature Presentations
The April meeting featured presentations on:

- Employment and Training Administration's (ETA's) New Business Engagement Strategy,

- Access to Capital, a study by Booz-Allen for National Institute of Standards and Technology, Manufacturing Extension Partnership (NIST MEP),
- Small-Business-Assistance-Program Metrics Project, a study by American University, Kogod School of Business, for INEAP's Metric Subgroup, and
- *Supporting Entrepreneurs and Small Businesses: A Toolkit for Local Leaders*, National League of Cities (NLC).

The meeting continued with Sharing and Discussion and concluded with Announcements.

Employment and Training Administration's New Business Engagement Strategy
Speakers: Gina Wells and Megan Lizik, Employment and Training Administration, Department of Labor

Department of Labor (DOL), ETA, has developed a 2012 workforce-investment workplan to provide technical assistance to businesses across the country. The nation's workforce-investment system is Federally funded and supports workforce-development activities through the States and local communities, who operate one-stop career centers. These centers are designed to provide a full range of assistance to job seekers either in person or online (www.careeronestop.org).

The focus of ETA's 2012 workplan is to help businesses become more engaged in developing the nation's workforce through four areas: credentials and skills attainment, job fairs, small-business and entrepreneurship support, and communicating workforce-system successes.

- Credentials and Skills Attainment (1st Quarter)

ETA has sought input from national employers and the academic community to discuss highly valued credentials and skills to determine industry-recognized credentials that employers value and seek when recruiting. Through these efforts, ETA's certification-finder tool (www.acinet.org) has been enhanced and highlights credentials that are endorsed or accredited by third-party organizations such as the American National Standards Institute and the National Commission for Certifying Agencies. The certification-finder tool can be searched by industry, occupation, or keyword to find relevant certifications to help an individual qualify for employment or advancement.

- Job Fairs (2nd Quarter)

By hosting job fairs, businesses can promote the services and raise awareness of ETA's one-stop career centers. ETA has developed a Business Services Leadership Website (businessengagement.workforce3one.org) that provides training materials for businesses on how to hold virtual career fairs as well as resources for employing youth, veterans, and persons with disabilities. ETA has designated June as American Job Fair Month and hopes businesses will help ETA promote the nation's job-center network to new employers and jobseekers across the country by hosting local job fairs.

- Small-Business and Entrepreneurship Support (3rd Quarter)

Through roundtable discussions with small businesses and entrepreneurs that have been involved with programs sponsored by SBA, Economic Development Administration, and ETA, ETA's goal is to find ways to best promote local, integrated, public/private partnerships to better support small businesses and entrepreneurs. ETA's Small Business Toolkit (businessengagement.workforce3one.org/news/view/small-business-toolkit) is designed to help business-services representatives build strong partnerships between the workforce-development

system and business-serving organizations in an effort to support entrepreneurship and self-employment at the community level.

- Workforce-System Successes (4th Quarter)

ETA is gathering information from employers, the National Association of Workforce Boards and their best practices, and the National Association of State Workforce Agencies' conference on *Bridging Business and Workforce Development*, to determine what is working with the workforce system. ETA's Business Services Leadership Website (businessengagement.workforce3one.org) contains information and resources for business-services representatives to become more effective in partnering with and serving their business customers.

Gina Wells (well.gina@dol.gov) and Megan Lizik (lizik.mega@dol.gov) welcome comments and feedback on ETA's workplan to better engage businesses with workforce development.

Discussion

- It was emphasized that jobseekers need to know an employer's certification needs. ETA's tool should allow for employers to input their certification requirements.
- A major national concern is employing military personnel returning home.
- www.myskillsmyfuture.org helps jobseekers find career matches.
- Detroit is hosting the annual National Veterans Small Business Conference and job fair in June 2012 (www.nationalveteransconference.com/welcome).
- ETA's O*NET (www.onetonline.org) is the nation's primary source on occupational information and allows jobseekers and workers to explore and search occupational opportunities and find those occupations that are most in demand.
- SBA has many programs to help veterans become business owners (www.turbotap.org/portal/transition/lifestyles/Entrepreneurship/The_US_Small_Business_Administration_Programs_Reserve_Component).
- It was noted that only 7% of small and medium-sized manufacturers are aware of ETA's efforts on certifications. ETA is working on a communications plan.
- In ETA's Career Pathways Initiative (https://learnwork.workforce3one.org/), State and local teams work collaboratively to develop a career pathway system at the local level.
- Certifications need to be standardized from industry to industry. ETA and NIST MEP (stacey.wagner@nist.gov) will work together to look at certification-standardization issues.

Access to Capital

Speakers: Clara Asmail and Doug Devereaux, Manufacturing Extension Partnership, National Institute of Standards and Technology, Department of Commerce

A major goal of NIST MEP is to promote and motivate innovation and growth among the nation's small and medium-sized enterprises (SMEs); however, a barrier for SMEs is capital. A report on access to capital, *Connecting Small Manufacturers with the Capital Needed to Grow, Compete, and Succeed* (www.nist.gov/ineap/related.cfm), developed by Booz-Allen for NIST MEP, looks at current capital accessibility and its impact on SMEs.

The most common reasons SMEs need capital are for:

- Working capital (to cover inventory and accounts receivables and to meet supply-chain demands of larger manufacturers),

- Purchasing machinery or equipment,
- Expanding or remodeling a facility, and
- Refinancing/restructuring their balance sheet.

Gap analysis reveals weaknesses and strengths in the availability, awareness, and accessibility of sources of capital for SMEs. Bank-loan activity has been recovering since the recession hit in 2007; however, small-business-loan approvals by big banks dropped during the month of March 2012. While there is money available through various Federal programs designed to help SME access capital, many of the programs are underutilized. Loans from $150,000 to $500,000 are especially underutilized and represent the amount a small business would most likely pursue. However, small businesses are too busy to take on the paperwork and banks feel that loans from $150,000 to $500,000 are too much work.

MEP, in coordination with other Federal, State, public-private partnerships, and private-sector stakeholders, is looking at ways to address the availability, awareness, and accessibility of capital to SMEs. Recommendations from the study fall into three areas:

- Business assistance, including developing new or enhanced business-assistance offerings, such as providing guidance to MEP Centers on how to identify and establish relationships with local business-assistance organizations,
- Partnership and collaboration, which would focus on building relationships with key stakeholders who also have an interest and role in serving SMEs through their services, and
- Federal strategic and programmatic activities, which would focus on integrating capital-access strategies into existing Federal programs and plans, modifying existing Federal program requirements, developing communication products to raise awareness, and enhancing current MEP activities.

MEP continues to work with its Centers to better engage local Community Development Financial Institutions, banks, private-equity investors, and other sources of capital to build relationships and help direct local manufacturers to relevant sources and to the right products. MEP has an inventory of sources of capital (Prototype of Capital Sources Inventory) that was developed during the study and is planning to adapt the listing into a web-based diagnostic tool for SMEs.

NIST MEP will continue to develop a comprehensive set of solutions that addresses the availability, accessibility, and awareness gaps related to both the supply of, and demand for, capital. NIST MEP will be developing a pilot "MoneyTech" tool that will incorporate Federal, State, and private programs that provide loans, grants, and equity-based financing for SME growth and extract financial information relevant to specific funding sources that will help build and represent the fundability of manufacturers.

NIST MEP welcomes ideas from INEAP-member agencies (clara.asmail@nist.gov and douglas.devereaux@nist.gov).

Discussion

- *Connecting Small Manufacturers with the Capital Needed to Grow, Compete, and Succeed* and resulting toolkits should be posted on business.USA.gov.
- Should credit unions address the sweet spot and loan to SMEs? Credit unions are not-for-profit organizations; therefore, allowing credit unions to provide greater than 9% of their

business to businesses (versus consumers) would give credit unions an unfair advantage. Small banks could syndicate with larger banks, where small banks would work together and re-package their loans to sell to larger banks (much like the mortgage industry).
- More comprehensive listings of capital sources have been compiled by such organizations as Kenneth Poole's Council for Community and Economic Research.
- The Minority Business Development Agency (MBDA) (icunnaro@mbda.gov) has found that medium-sized businesses face unique challenges. An example is that minority-owned medium-sized businesses are vulnerable to takeovers.

Small-Business-Assistance-Program Metrics Project

Speakers: Beth Torres, Office of Small and Disadvantaged Business Utilization, Department of Veterans Affairs

Ralph Kirkpatrick, Lee Brindle, Raashi Binjrajka, Andres Bu Soto, Anthony Frazier, and Adrian Montgomery, Kogod School of Business, American University

Introduction

At the April 2011 INEAP meeting, a round-robin discussion was held on metrics. Three questions were posed:
- How does a Federal agency measure how well Federal investments are affecting the nation?
- How does a Federal agency measure a program's success?
- How does the Federal government measure the benefit of small-business programs?

It was determined that metrics for small-business programs within the Federal government must be better defined. Beth Torres took the lead to develop an INEAP special-interest group on metrics.

From that initial round-robin discussion, the INEAP Metrics Subgroup was formed. After several meetings, the Metrics Subgroup developed a memorandum of agreement with American University, where the Kogod School of Business would help produce a suite of small-business metrics through its practicum course for 2nd-year Masters of Business Administration students.

After initial discussions with the INEAP Metrics Subgroup, it was decided that the ultimate measure of success for small-business programs is job creation.

INEAP Metrics Report – Small Business Job Creation Analysis

Metrics are needed to determine whether Federal-government programs are creating jobs. These programs fall into three categories:
- Advocacy, through awards, partnerships, and research,
- Financial assistance, through grants, loans, subsidies, infrastructure, and contract awards, and
- Technical assistance, through advising, training, counseling, hiring, information dissemination, and education.

Traditionally, impact is measured after the fact. The power of metrics is to be able to determine impact in real time, to measure progress, and to then make adjustments.

To effectively determine the impact of a program, it is essential to:
- Define metrics properly,

- Standardize the metrics, and
- Communicate the metrics.

It is crucial for metrics to tell the story:
- Communicating mission success is critical for Congressional and agency oversight,
- Sharing successful programs and implementation approaches is critical for an effective government, and
- Attracting businesses to take advantage of agency programs will help small businesses create jobs.

Project Process

The goals of INEAP's Metrics study are to:
- Identify agency programs through Performance and Accountability Reports, agency websites, and General Accounting Office reports on program effectiveness,
- Catalogue agency programs and metrics,
- Analyze metrics as leading (programs need leading indicators to help justify program continuance and to steer the direction of a program), lagging (which confirm long-term trends, but do not predict them), and "but for" (what would the outcome be "but for" this program),
- Review industry best practices,
- Identify strengths, weaknesses, and opportunities (such as developing a composite index) of current metrics, and
- Develop a Federal dictionary of terms, which will standardize terms used in small-business metrics across the Federal government.

Summary

Thus far, the Metrics study has shown that:
- Standardizing metrics across job-creation efforts allow for evaluation across programs; continuous improvement as strong programs stand out and gaps are easier to identify; collaboration and sharing of resources, which allow for greater impact; and strengthening of the metrics base/stronger connections.
- Developing clear goals, metrics, and targets communicates the efforts of a program/illustrates a program's story.
- Developing a composite index, which is a combination of indicators intended to measure overall impact over time, will provide a gauge on a program's effectiveness and can therefore enhance a program's credibility.

Discussion

- The next phase of the study will look at specific elements, develop new methods for data collection, and propose new analytical tools and methods.
- The template being developed for the Federal government and manufacturers should be useful for other organizations and associations.
- Reports generated from the Government Performance and Results Act are silo/vertically based. The Metrics report is a study across the Federal government.
- The Federal government represents silos within silos. The approach of the Metrics study is across agencies.

- The Metrics report is unifying the message. Every agency is currently writing its story; however, with standardizing metrics and developing a dictionary of terms and a composite index, there is strength to having one message.
- An audience for the Metrics study should be elected officials.
- Whether a program is sustainable is important; what is the long-term life of a program after the funding ends?
- How jobs creation is defined is critical. Was a job created through funding or through best practices? How is return on investment determined?

Supporting Entrepreneurs and Small Businesses: A Toolkit for Local Leaders
Speaker: Christy McFarland, National League of Cities

NLC (www.nlc.org/) has conducted a multi-year study to better understand how local governments can support entrepreneurial and small-business growth. NLC researched literature and interviewed and conducted roundtable discussions with experts, city leaders, and practitioners involved with economic and regional development. At the national level, small businesses are a key to the U.S. economic recovery. At the local level, small businesses employ local residents and create a sense of place that enhances a community's quality of life.

The study focuses on four areas: understanding small-business development, roles within city hall, partnerships, and programs developed in cities across the country. The toolkit includes examples of support programs that range from regulatory improvements to university partnerships. Common themes across the programs are leadership, communications, and partnerships.

Understanding Small-Business Development
- As small businesses grow and develop, they face the same management, technical, and financial challenges.
- As small businesses grow and face new challenges, they need different resources and relationships to support them.
- Understanding the different stages and challenges a small businesses faces as it grows allows local governments to provide policies to support them.

Roles Within City Hall
- To support entrepreneurs and small businesses, local governments must first examine the policies and actions that lie within their powers. These include leadership, communication strategies that create avenues for local businesses to engage with local government, and an efficient regulatory environment.
- Strong local, elected leaders are needed to prioritize issues and show that entrepreneurs and small businesses are important to a community.
- Communication between the entrepreneurial/small-business community and the municipal government is needed to improve processes and to better respond to needs.
- Unclear regulations are especially burdensome on new and small businesses. Efforts must be made to communicate the availability of regulatory-assistance services.

Partners
Cities and local leaders can create meaningful partnerships because they can:

- Bring together service providers and business groups who may not be connected to each other,
- Identify gaps in the types of services being provided, and
- Serve as a centralized source of available services for small and new businesses.

Key partners include colleges and universities, small-business development centers, community-based organizations, business groups such as local chambers of commerce, and financial institutions.

City Examples

- To encourage local businesses to begin and continue greening their operations, the City of Austin, Texas, started a program called Austin Green Business Leader, which supports sustainability activities throughout the city.
- In an effort to spur economic development along Boston's waterfront, the Mayor developed a strategy that focuses on nurturing new and growing industries. A key component of Boston's Innovation District is that it offers entrepreneurs networking opportunities and business-development accelerator services.
- Instead of approaching economic development by attracting large companies with tax and land incentives, Littleton, Colorado, has developed its economy from within, known as economic gardening.
- New York has developed a program that supports immigrant small businesses by helping businesses build capacity, link businesses with customers, and connect businesses with resources.
- Scottsdale, in partnership with Arizona State University, has established the SkySong Center, a one-stop shop designed to incubate and accelerate startups.
- Seattle, Washington, recently focused its economic-development activities on facilitating connections, providing on-the-ground services to businesses needing assistance, and advocating policy and service changes to improve Seattle's business climate.
- Wichita, in collaboration with the Kansas World Trade Center, has developed a number of services to help small businesses achieve greater profits through trade. These services include consultation and research, education and training, translation and interpretation, and global credit reports.

Next Steps

- NLC is sharing the strategies and lessons learned from the study to help city leaders 1) better support entrepreneurs and small businesses in communities across the country and 2) shed additional light on how local governments contribute to business growth.
- NLC hosts bi-monthly Economic Development Network webinars. A webinar on Wednesday, May 23, at 2:30 p.m., Eastern time, will focus on small-business financing and support services.

Discussion

- NIST MEP Centers (www.nist.gov/mep) and MBDA's Minority Business Enterprise Centers (www.mbda.gov/main/offices) are good resources for NLC's toolkit.
- NLC's bi-monthly Economic Development Network webinars should be placed on business.USA.gov (contact dennis.alvord@sba.gov).

Sharing and Discussion

Appalachian Regional Commission

The Appalachian Regional Commission (http://www.arc.gov/) is helping local communities to form angel-investment funds in the Appalachian Region. Two types of awards are available through this Request for Proposal (RFP):

- Technical assistance will be provided to local entities to support new angel-fund formation or to improve the performance of an existing angel-fund/network. Up to four applicants will be selected for this support.
- Direct grant support will to be provided to qualified local organizations to support the formation of a new angel fund. Up to $30,000 of direct grant support will be provided to one qualified applicant in this round.

Selected applicants are anticipated to raise over $1 million each in local investment capital in angel-investment funds for early-stage and/or expanding companies. Proposals are due by 5:00 p.m., Eastern time, on June 15, 2012. Informational webinars will be held on May 14 and 15, 2012, to answer questions about this RFP and about angel-fund formation and operation.

Announcements and Concluding Comments

- Host, speakers, and attendees were thanked for their continued support of INEAP.
- Attendees are encouraged to share any type of collaboration tools, such as inter-agency agreements, alliance agreements, memoranda of understanding, or web casts, which can be posted on INEAP's website to help foster collaboration efforts. The web address for INEAP is www.nist.gov/ineap.

Next Meeting

Date: May 23, 2012
Time: 2:00 - 4:00 p.m.
Host: International Trade Center

Attendees

Clara Asmail, Department of Commerce, National Institute of Standards and Technology, Manufacturing Extension Partnership
William Bailey, American University, Kogod School of Business
Alexander Bant, American University, Kogod School of Business
Raashi Binjrajka, American University, Kogod School of Business
Ann Bradbury, Small Business Administration, Office of Small Business Development Centers
Lee Brindel, American University, Kogod School of Business
Andres Bu Soto, American University, Kogod School of Business
Michael Chodos, Small Business Administration, Office of Entrepreneurial Development
Mark Clark, American University, Kogod School of Business
Ivonne Cunarro, Department of Commerce, Minority Business Development Agency
Matthew Cunningham, American University, Kogod School of Business
Antonio Doss, Small Business Administration, Office of Grants Management
Anthony Frazier, American University, Kogod School of Business
Scott Henry, Small Business Administration, Office of Small Business Development Centers
David Hughes, Appalachian Regional Commission
Pam Hurt, Society of Manufacturing Engineers

Ralph Kirkpatrick, American University, Kogod School of Business
Carolyn Kluck, Appalachian Regional Commission
Lauren Leonard, Department of Labor, Office of Recovery for Auto Communities and Workers
Megan Lizik, Department of Labor, Employment and Training Administration
Glynis Long, Small Business Administration, Office of Women's Business Ownership
Jeff Lucas, Department of Commerce, National Institute of Standards and Technology, Manufacturing Extension Partnership
Isela Martin, Department of Labor, Office of Small and Disadvantaged Business Utilization
Paul Matthai, Environmental Protection Agency, Office of Pollution Prevention and Toxics
Christy McFarland, National League of Cities
Adrian Montgomery, American University, Kogod School of Business
Rachel Newman, Small Business Administration, Office of Small Business Development Centers

Welcome to Central Oregon

Where the commute times are short and breathtaking views await you at every turn. The region features dramatic snow-capped mountain ranges and high desert plateaus within Deschutes, Crook and Jefferson Counties. Located halfway between San Francisco and Seattle, one of the hottest small metropolitan markets in the U.S. is Central Oregon. In the last decade the region has seen some of the highest sustained GDP growth, job and population growth. This year, the Milken Institute ranked the Bend-Redmond region in the top 5 of its Best Performing Small Cities study. The report noted growth of the region's concentration of high-tech industry and robust broadband access as key strengths for the ranking.

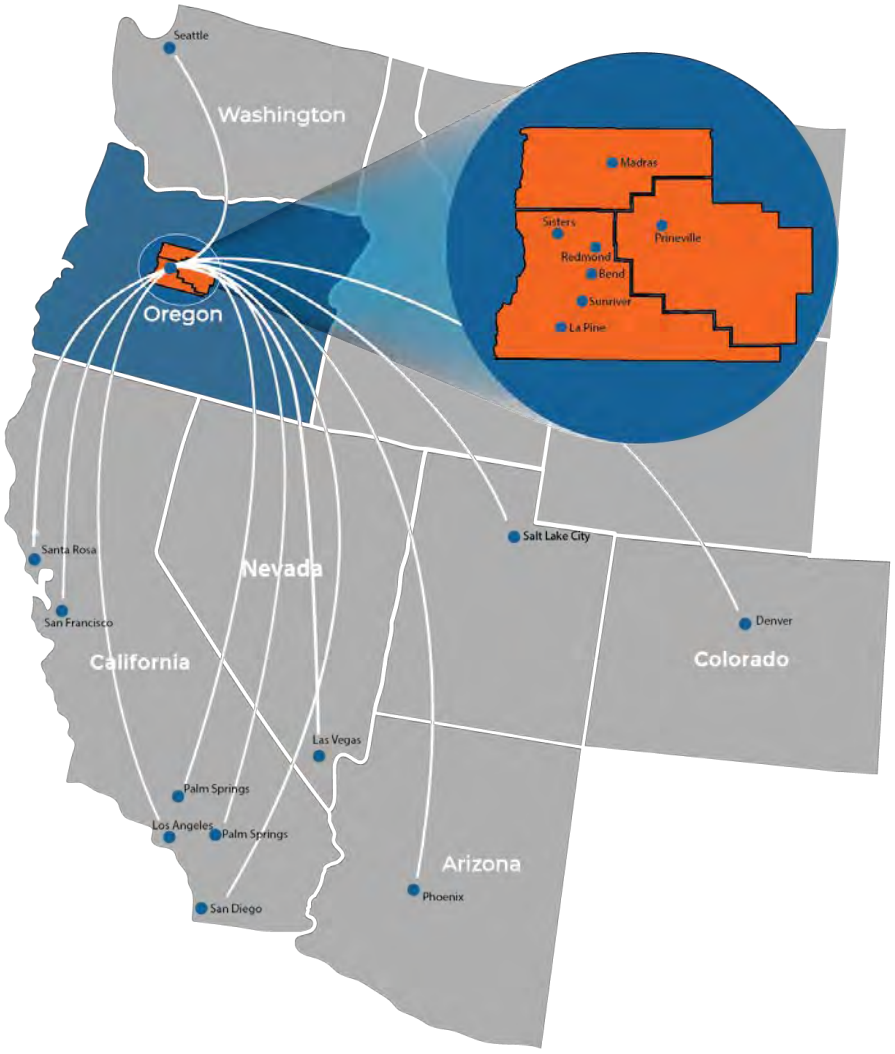
Central Oregon is pulling extraordinary talent and capital, fostering a diverse and highly entrepreneurial business ecosystem. Deschutes County received the most investment in Oregon in 2022, according to SmartAsset. Lured by natural scenic beauty and big city amenities without big city commute times, people are learning that having a true work-life balance is possible. Employees are happier and companies are more innovative and capital-efficient. Although domindated by small to mid-sized firms, Central Oregon brands compete globally - and win.

CENTRAL OREGON OVERVIEW

Regional Population: **259,127**
(2022 estimates from Portland State University)

Regional Labor Force: **123,953**
(Seasonally adjusted total for 2021 from Oregon Employment Department)

Bend-Redmond MSA GDP Per Capita: **$54,390**
(2020 estimate from the Bureau of Economic Analysis)
*Bureau of Economic Analysis data is only available for the Bend-Redmond MSA



Access outside and within the region has never been easier, with five national carriers flying up to 54 segments daily to 12 airports and major freight routes to the I-5 and I-84 corridors, all the while maintaining average commute times of less than 24 minutes between workforce centers around the region.

POPULATION

Central Oregon has been among the fastest growing regions anywhere in the U.S.

In-migration has been the dominating factor in the region's growth. With millions of visitors annually, Central Oregon continues to attract thousands of new residents from all over the country each year for its outdoor amenities, arts and culture opportunities, quality healthcare, and a growing education system.

POPULATION CHANGES FOR CENTRAL OREGON

Area	Population Growth 2010 - 2022	Net Migration %
Oregon	450,777	121%
Counties		
Deschutes County	49,828	109%
Crook County	5,184	98%
Jefferson County	3,684	110%

Source: Population Research Center, 2010-2022

"Central Oregon's economic growth is stronger than the state and nation overall. The primary reason is the high quality of life that attracts new residents. Faster population growth means local businesses can hire and expand at a faster rate due to the influx of working-age migrants and the growing labor force."

Josh Lehner
Economist,
Oregon Office of Economic Analysis

NEW RESIDENTS, NEW IDEAS & NEW ENERGY

#5

BEST MOUNTAIN TOWN IN THE UNITED STATES

***-OUTSIDE*, 2022**

With over 3.9 million visitors flocking to Central Oregon each year, it proves a great introduction to the region's culture, lifestyle and a great first impression for businesses. Central Oregon's population grew by an astounding 29.1% between 2010-2022. In 2022, Bend was one of six small cities with the most startups per capita in the U.S. While the population grows, Central Oregon is strategically investing in infrastructure and public spaces to ensure growth is sustainable. Citizens and organizations across the region are cultivating a community that has consciously decided to live here and attracting new talent pools to serve the increasing demand for labor.

POPULATION TOTALS FOR CENTRAL OREGON

Area	2000	2010	2015	2020	2022	% Growth 2010-2022
Oregon	3,421,399	3,837,300	4,013,845	4,243,959	4,281,851	11.8%
Crook County	19,184	21,020	21,085	24,866	26,162	24.7%
Deschutes County	115,367	157,905	170,740	199,263	207,561	31.6%

MOVE

EDCO guides employers outside the region through the relocation process as a resource for regional data, incentives, talent, site selection, and A-Z problem solving.

Business Cost Comparison

Oregon offers more incentive programs to traded-sector* businesses than Washington or California. Even without taking those incentives into consideration, Oregon is still a more cost-effective choice for doing business. Connect with EDCO for a detailed look at the business costs in Central Oregon.

**companies that sell their products or services outside the region, bringing new jobs and capital investment to the area*

	OR	CA	WA
Avg. Electricity Rate (¢/kWh)	8.95¢	19.65¢	8.75¢
Avg. Natural Gas Rate ($/kcf)	$5.07	$9.75	$8.21
State & Local Sales Tax Rate	None	8.82%+	8.86%+
State Business Tax Climate Index	#24	#48	#28

"While our move to Central Oregon may have started for personal reasons, it has allowed us to do more with our business than we thought possible. It has allowed us to hire amazing employees – the available talent here in Central Oregon has proven to be of the highest caliber and chocked full of integrity. Sometimes you feel like you can get lost in a big city. In Sisters we have been able to be part of a growing and nurturing business community." **- Wyatt Woods, President and Owner, Holy Kakow**

Case Study: Holy Kakow

Founded in Portland in 2009, Holy Kakow creates premium organic chocolate sauces and syrups that are used in coffee shops across the nation and globe. After running the business for nearly a decade, President and Owner Wyatt Woods decided a move to the City of Sisters would be beneficial for his family. The next step was to figure out how to move the successful business. After EDCO's help with site selection, incentives, permitting, and more, Holy Kakow was able to move their operations into a new building in the Sisters Business Park. The relocation allowed them to scale for growth, even during the pandemic, expanding their employment from three to eight in the span of a couple months. Holy Kakow have their sights set on new product launches. With the backing of the community and the growing number of craft food businesses in Sisters, the company is surrounded by a strong business ecosystem to help them succeed.

Get connected to the growing industry clusters that include: advanced manufacturing, bioscience, outdoor products, technology, natural foods, and consumer goods.

EDCO links you to tools to help your company including: connections to the local supply chain, talent acquisition, incentives, business finance, market intelligence, and more.

EDCO helps you navigate the regional and local real estate market, infrastructure and permitting processes.

WHY CENTRAL OREGON?

The region offers a pro-business environment with several incentives and business finance options to encourage economic growth. Oregon also allows corporate net operating losses to be carried forward for up to 15 years without a cap, which can meaningfully reduce your business's tax liability.

For businesses looking to relocate, Central Oregon has a reputation for welcoming new companies. The region offers a tightknit community without sacrificing talent, education opportunities or quality healthcare. EDCO's network can help your business streamline decisions when choosing a new location.

START

EDCO mentor and advise scalable young companies from concept to exit on issues such as access to capital, critical expertise and business strategy.

"We moved to Bend to start Altitude Beverages in the fall of 2020. Besides the 300 days of sunshine and incredible outdoor activities, it is a great startup incubator."
- Thomas Angel, Founder & CEO, Altitude Beverages

Case Study: Altitude Beverages

Thomas Angel and Laura Melgarejo moved to Bend to start Altitude Beverages in the Fall of 2020, citing the startup community as a key contributor to their decision to move. Their first product - The Everything Latte - launched that same year and had such success that they expanded the line to include green and black tea lattes and sparkling white tea mocktails. In 2022, Altitude Beverages was a semifinalist at the Bend Venture Conference and has continued to work with EDCO for mentorship and access to funding. With a growing number of consumers looking to incorporate functional ingredients into their routine, Altitude Beverages' shelf-stable, canned products are poised for growth and are now available in about 500 stores across 13 states. Inspired by the community in Central Oregon, Thomas Angel partnered with fellow product makers from the area to form Cultivate Bend, a mutual benefit trade organization aimed at cultivating a vibrant ecosystem for the growing cluster of entrepreneurs, operators and leaders in Central Oregon's food and natural products industry.

ENTREPRENEURIAL SUPPORT

A driving force for Central Oregon's economic performance is a collaborative and inclusive entrepreneurial community. This is supported via the number of new business registrations, which has outpaced far larger cities. According to SmartAsset data, 28.96% of Deschutes County residents have small business incomes, and independent businesses generate about 13.02% of the income for the county.

The region is large enough to provide resources and access to capital that help new entrepreneurs get started, while still being small enough that those resources are interconnected to support businesses as they grow. Assets managed by EDCO include monthly Central Oregon PubTalks, the Stable of Experts mentorship program and the largest Angel Conference in the PNW, the Bend Venture Conference. Since launching in

BEST SMALL CITIES FOR STARTING A BUSINESS

Area	National Rank	Business Environment Rank	Access to Resources Rank
Washington, UT	1	4	3
St. George, UT	2	1	359
Bozeman, MT	3	8	18
Redmond, OR	**16**	**5**	**127**
Bend, OR	**23**	**3**	**54**

Source: WalletHub, April, 2023.

Both Redmond and Bend made WalletHub's Top 30 list for best cities to start a business, at #16 and #23 respectively, based on an index of criteria that included business environment, access to resources and business costs. They were the only two Oregon cities to make it in the top 450 of 1,334 small cities ranked in the index.

GROW

EDCO partners with local traded-sector companies to help them grow and expand, offering them the very same incentives and assistance as relocation projects.

"Our flagship manufacturing facility is located in Bend, nestled at the base of the Cascade Mountain Range, which also inspired the brand name. The views and outdoor amenities are unmatched, but the entrepreneurial and community support we have received from day one has been the driving factor in bringing our homegrown business sustainable success in Oregon and beyond. Our employees, customers and partners are what make Bend home and inspire continued growth." **- Affton Coffelt, Founder and CEO, Broken Top Brands**

Case Study: Broken Top Brands

HANDMADE
BROKEN TOP®
BRANDS

Broken Top Brands creates handmade, sustainable, eco-conscious candles and body products that have been featured in National media outlets such as BuzzFeed, Oprah Daily and HuffPost. Started as Broken Top Candle Co. in 2015 out of Founder Affton Coffelt's kitchen in Bend, the company has now blossomed to 19 employees and has grown its footprint to an 18,000 SF manufacturing facility.

Broken Top Brands is currently selling an array of all natural, biodegradble and paraben-free lifestyle products in the U.S., as well as Canada and parts of Europe. The brand's market is primarily wholesale with an organically growing e-commerce presence. Customers can find their products in over 2,800 retail locations nationally and internationally, with Whole Foods being their largest account.

Broken Top Brands was attracted to starting a business in Central Oregon for its quality of life and supportive community. Due to it's unique company culture and location, the business has had success retaining employees which has enabled its continued expansion. Broken Top Brands has sustained steady growth and continues to partner with EDCO, 1% for the Planet, One Tree Planted, Opportunity Knocks, Bend Chamber, and Business Oregon to serve their loyal customer base.

#5
FOR 5-YEAR JOB GROWTH IN THE U.S.
- MILKEN INSTITUTE, 2022

MANUFACTURING EMPLOYMENT GROWTH by Total Payroll 2012-2022	
U.S.	10.4%
Oregon	17.8%
Deschutes County	79.3%
Jefferson County	85.9%
Crook County	49.1%

Source: State of Oregon Employment Department

"Total nonfarm private sector employment in Central Oregon has grown by 50% over the last 10 years, which continues to be significantly faster than the statewide growth of around 25% in 2022. At the county level, Deschutes County has had the largest private sector growth since 2012, growing by approximately 52%, while Crook County has seen employment grow by 41% and Jefferson County by 35%. Employment in the private sector is projected to grow by 18% across the region between 2021 and 2031." **- Nicole Ramos, Oregon Employment Department**

Workforce Development

Communities in Central Oregon are actively engaged in aligning workforce goals with economic development. Local education institutions and private sector employers continue to find innovative ways to improve skill attainment within the workforce. In addition to a growing post-secondary education framework, East Cascades Works (EC Works) supports the talent needs of employers through intern placement, on-the-job training salary support and recruiting assistance.

Central Oregon Community College (COCC) has campuses in Bend, Prineville, Redmond, and Madras. Students can choose from over 25 Certificate and Associate options.

OSU-Cascades offers over 26 degree programs and recently announced a program that will integrate career preparation into coursework for all students to prepare them for success.

INCOMING INVESTMENT

The combination of a collaborative culture, a supportive attitude among government and economic development partners, plus a location that attracts talent and investment all help Central Oregon compete nationally.

INCOMING INVESTMENT BY COUNTY IN OREGON

SERVICES & INFRASTRUCTURE

UTILITIES

Most of the region has been newly built in the past two decades, making Central Oregon's telecommunications infrastructure one of the Northwest's most technologically advanced. Businesses and telecommuters benefit from reliable fast data speeds and upload times.

EDUCATION

Central Oregon is well-recognized for its high level of education, with some of the best K-12 public schools in the nation. In 2022, the Bend-La Pine school district's average SAT scores surpassed the national average by 57 points. Additionally, the higher education opportunities abound. From Oregon State University-Cascades campus' ongoing expansion, to Central Oregon Community College's four campuses in the region, there are opportunities for all to obtain a quality education.

HEALTHCARE

St. Charles Health System is the largest healthcare provider in the region, and is also the largest employer with over 4,500 employees across the tri-county area. The hospital received HealthGrade's 2021 Pulmonary Care Excellence Award™ and offers a network of more than 100 clinics and specialty practices throughout the area.

ADVANCED MANUFACTURING

- More than 100 businesses in advanced manufacturing make their own products here in Central Oregon, as well as provide a critical role in the supply chain for other OEM in aviation/aerospace, brewing & distilling, specialty food processing, and automotive.
- Additive and subtractive machining of metals and plastics, advanced welding and metal fabrication, specialty metals casting, production printing and publishing, as well as specialized machinery and equipment continue to advance locally.
- The largest employers in this industry group include Precision Cast Parts (PCC) Schlosser, Keith Manufacturing and BASX Solutions.

AVIATION & AEROSPACE

- The production of light aircraft in Central Oregon spans back more than 30 years and over that time, 25 aircraft have moved through the process of conceptual design to flight.
- Composite (carbon fiber) fabrication and innovation aircraft are the region's specialty offering a cluster of world-class talent and capabilities here.
- Some of the most successful flight training programs in the country are located in the region with both fixed-wing and helicopter flight schools that serve the global industry, including Leading Edge, Hillsboro Aero Academy and Central Oregon Community College.

BIOSCIENCE

- Producing everything from titanium implants to cutting edge drug research, Central Oregon's bioscience industry has been experiencing year-over-year double digit employment growth for nearly a decade.
- Quietly, Central Oregon's bioscience industry has proven capable of attracting world-class scientific and technical talent that has made companies here competitive on a global scale.
- Swiss-based pharmaceutical research and manufacturer, Lonza, is the largest bioscience company in the region, and among the largest in Oregon, with two campuses and additional operations scattered across the region.

BREWING & DISTILLING

- Central Oregon is home to breweries both large and small, with Deschutes Brewery production placing it as the largest craft brewery by volume in Oregon.
- For Oregon, which has 318 craft breweries, nearly one-third of the largest 30 brewers by volume are located in Central Oregon – testimony to the quality of product produced here.
- The region is also home to a dozen craft cideries and distilleries. Notably, two of these, Bendistillery and AVID Cider, hold the distinction of being the second largest in the state in their respective sectors.

#2 BEST CITIES FOR BEER DRINKERS -SMARTASSET, 2022

BUILDING PRODUCTS

- After 100+ years and considerable systemic change across the industry, the building products sector is still Central Oregon's largest traded-sector employer.
- Businesses in this sector compete and win on a global scale, innovating and automating as global leaders in their respective sub-industries, including wood doors and windows, mouldings, cabinetry, furniture, and musical instruments.
- The region's largest manufacturer and third largest private employer, Bright Wood Corporation, is based in Madras, with operations in Redmond, Culver and Prineville. The company has been growing in Central Oregon for over a half century.

Bright Wood Quality Millwork · CertainTeed Saint-Gobain · JELD-WEN Windows & Doors · Breedlove · Chase Doors · Powered by Endura Door Components Made in the USA · Warm Springs Composite Products · Brian's Cabinets

OUTDOOR GEAR & APPAREL

- Central Oregon is home to a diverse group of businesses in a variety of sub-sectors, including rock climbing, water sports, hydration, hiking, backpacking, recreation vehicles, road and mountain biking, outerwear, and software.
- The region is home to the Oregon Outdoor Alliance (OOA) which is dedicated to connecting and cultivating the industry through events, mentorship and advocacy.
- The region's largest manufacturer and third largest private employer, Bright Wood Corporation, is based in Madras, with operations in Redmond, Culver and Prineville. The company has been growing in Central Oregon for over a half century.

- WASHINGTON POST, 2022

PROFESSIONAL SERVICES

- Central Oregon companies are increasingly exporting professional services outside of the tri-county region in specialties including engineering, architecture, accounting, HR, recruitment, creative services, advertising, and publishing to name a few.
- The creative, marketing and advertising sub-sectors of this industry are particularly strong in Central Oregon with firms being attracted to the region from as far away as Barcelona, Spain.

TECHNOLOGY

- Including software companies, electronics manufacturers, alternative energy and data centers, the region has over 130 tech companies employing nearly 3,000 people.
- Five dozen software companies call the region home, often locating their headquarter operations in Central Oregon.
- Prineville is a growing data center hub and is home to Meta's first and largest data center campus, a 4.5 million square foot complex. Central Oregon offers a unique advantage for data centers due to its available infrastructure, affordable industrial land, multiple telecom carriers, desert climate, and globally competitive tax incentives.

ABOUT EDCO

Founded in 1981, EDCO is a non-profit corporation supported by private and public members and stakeholders. Our mission is to create a balanced and diversified economy with a strong base of middle-class jobs in Central Oregon.

To do this, we focus on helping companies do the following:

MOVE. We guide employers outside the region through the relocation process as a resource for regional data, incentives, talent, site selection, and more.

START. We mentor and advise scalable young companies from concept to exit on issues such as access to capital, critical expertise and business strategy.

GROW. We partner with local traded-sector companies to help them grow and expand.

EDCO'S RESULTS

Fiscal Year	Companies	Jobs (New & Retained)	New Capital Investment
2022 - 2023	23	126	$53.7 million
2021 - 2022	13	483	$1.98 billion
2020 - 2021	34	451	$208.7 million
2019 - 2020	36	774	$67.1 million

OREGON TECH

Soaring data center electricity demand could trigger Northwest blackouts, industry insiders say

Updated: Dec. 11, 2024, 10:14 p.m. | Published: Dec. 11, 2024, 1:44 p.m.

Power lines feed an Amazon data center near Boardman. Dave Killen / The Oregonian

OREGONLIVE
The Oregonian

By Mike Rogoway | The Oregonian/OregonLive

A panel of authorities on the data center industry told Northwest energy planners Wednesday that the tech sector will take all the electricity it can get its hands on, warning of severe consequences if the region doesn't respond in time.

"We're going to need to build more transmission faster than any time we have in the last 70 years as a region," said Robert Cromwell, who consults with Northwest power utilities. He said the region is already flirting with rolling blackouts because peak energy demand is already near the region's capacity to provide electricity.

OREGONLIVE
The Oregonian

Data center demand is soaring because of artificial intelligence, which uses massive amounts of electricity for advanced computation. These powerful machines already consume more than 10% of all of Oregon's power and forecasters say data center power use will be at least double that by 2030 — and perhaps some multiple higher.

If the Northwest fails to add enough generation and transmission to meet the growing energy needs, Cromwell said periodic blackouts are inevitable at times power demand is at its greatest. He used an industry term, "rotating load shedding," to describe rolling blackouts, which briefly cut off power to homes, businesses and even hospitals that need electricity to provide life-saving care.

"Nothing will change policy faster than elected officials going to constituent funerals, and it won't be for the better because it'll be reactionary and less than fully thought through," Cromwell told Wednesday's meeting of the Northwest Power and Conservation Council.

Oregon has one of the nation's largest and fastest-growing data center industries, owing in large part to some of the most generous tax breaks anywhere in the world. Data centers don't employ many people, but the wealthy tech companies that run them enjoy Oregon tax giveaways worth more than $225 million annually.

Amazon, Apple, Google and Meta operate enormous data centers in central and eastern Oregon. Several other companies, including Oracle, LinkedIn and the social network X, have huge installations in Hillsboro.

Earlier this year, the power council issued a forecast suggesting a range of possibilities for data center power demand through the end of the decade. In the middle case, the council said Northwest data centers would need 4,000 average megawatts of additional electricity in 2030.

That's an enormous jump in demand, equivalent to the power use of 3 million homes.

And yet on Wednesday, Cromwell said the council's median forecast is too low.

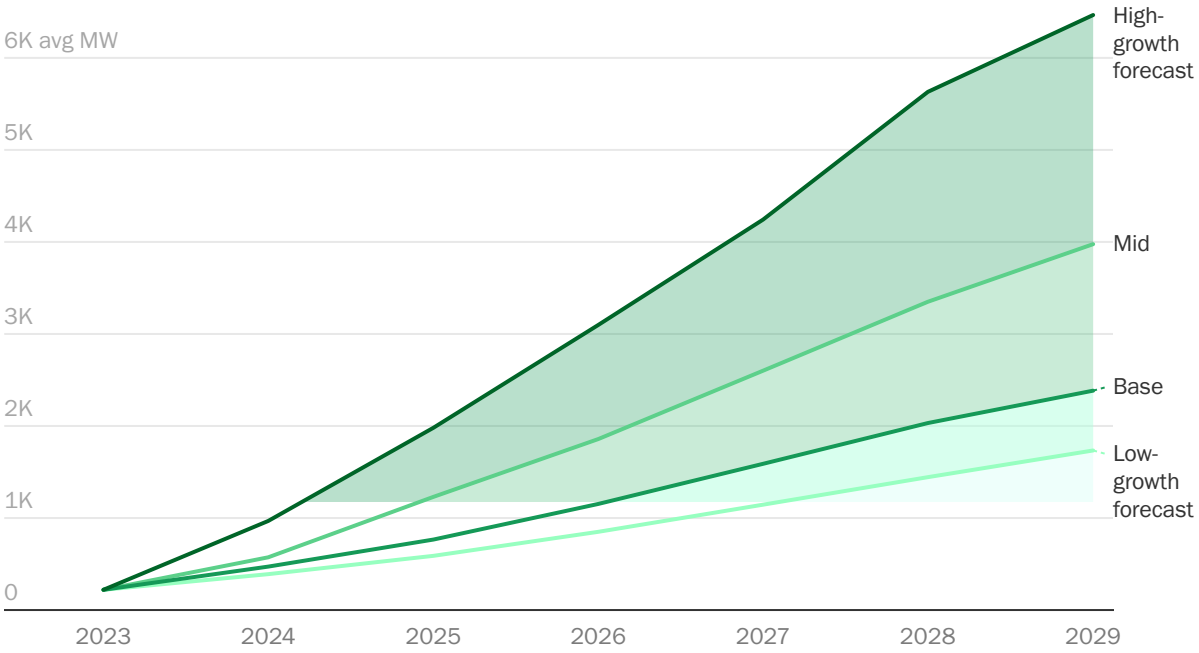
"Your medium case is not high enough and your high case is probably pretty close to spot on," he said.

The high forecast predicts that data centers will actually need an additional 6,500 average megawatts in the next few years — equivalent to the power needs of nearly 5 million homes.

OREGONLIVE
The Oregonian

Expected growth in NW electricity use by tech industry

Energy forecasters say Northwest data centers and chip factories could need thousands of additional megawatts of electricity by the end of the decade. They say 80% of the growth will come from data centers. At the high end of the forecast, new data centers could require nearly as much power as all the homes in Oregon and Washington use today.



The Northwest Power and Conservation Council says all four scenarios are possible. Outside consultants say the high forecast is the most likely.

Source: Northwest Power and Conservation Council • Get the data

"There's no question in my mind that the demand for computation and AI, and the demand to plug in (computer processors), exceeds the available power that we have by 2030," said Brian Janous, a former Microsoft vice president now consulting for industrial electricity users.

There's little prospect of blunting that growth by shifting demand to other data centers during peak times or through the invention of more efficient computers, Janous and others told the council on Wednesday. He said the demand for artificial intelligence is so high that data center operators will use all the electricity they can get and will operate all their facilities around the clock.

When power demand exceeds supply, during winter storms or heatwaves for example, utilities and governments must make wrenching decisions about who loses power and for how long. Turning off power to data centers could preserve power for homes and hospitals but would have its own negative consequences.

Think about the faulty CrowdStrike software update last summer, said panelist Sarah Smith, with the Lawrence Berkeley National Laboratory. That took down banks, hospitals, factories, news sites and many others as online systems went awry.

“Air travel was disrupted for days,” Smith said. “There was a lot of really wide-ranging impacts you could imagine.”

The Northwest Power and Conservation Council is a regional organization that works with utilities and governments in Idaho, Montana, Oregon and Washington to balance future power needs and environmental protections. It convened Wednesday’s panel on data centers to help plan a new forecast the council will issue next year.

Big tech companies generally accept the scientific consensus that carbon emissions are causing climate change. Until recently, most tech companies expressed public commitments to find renewable power for their data centers.

Recently, though, Janous said they’ve become “willing to compromise, in the short run” on their clean power goals because they’re desperate for any source of electricity.

Despite the data centers’ voracious appetite for power, the panelists expressed some hope that the region will be able to meet the challenge and, in time, push data center operators to return to their clean energy aspirations. They suggested a Northwest regional transmission authority, long under discussion, could help streamline the construction of new power lines and collaboration among western states.

Data centers’ power needs are triggering expensive upgrades to the Northwest’s power lines and prompting construction of new power plants. There is growing concern among ratepayer advocates, regulators and politicians that households will end up bearing much of the cost of data center growth through higher residential power bills.

On Wednesday, panelists said data center operators are highly motivated. They said tech companies probably would be willing to bear the cost of additional power themselves, provided they have a pathway to get that energy quickly.

MORE BY MIKE ROGOWAY

"The companies that are asking for this infrastructure are extraordinarily deep-pocketed and there's a huge willingness to pay," Janous said, "because the returns they earn on the back end are massive."

Food	10.4	10.5	Feb. 1981
Food at home	12.2	12.3	Apr. 1979
Food away from home	7.7	8.0	Nov. 1981
Energy	41.6	43.5	Apr. 1980
Fuel oils and other fuels	70.4	58.8	Apr. 2022

Expenditure category	12-month percent change, Jun. 2021–Jun. 2022	Largest percent change before June 2022	Month of previous largest percent change
Motor fuel (including gasoline, all types)	60.2	68.2	Mar. 1980
Electricity	13.7	14.8	Apr. 2006
Utility (piped) gas service	38.4	45.3	Oct. 2005

Prices for food increased 10.4 percent for the 12 months ending June 2022, the largest increase since February 1981. Prices for food at home rose 12.2 percent over the last 12 months, the largest increase since April 1979. Prices for food away from home rose 7.7 percent, the largest 12-month change since November 1981.

Energy prices rose 41.6 percent over the last year, the largest 12-month increase since April 1980. Within the energy category, motor fuel prices (which includes all types of gasoline) increased 60.2 percent over the year. Gasoline prices increased 59.9 percent, the largest 12-month increase since March 1980. Electricity prices rose 13.7 percent, the largest 12-month increase since April 2006. Natural gas (piped utility gas) prices increased 38.4 percent over the 12 months ended June 2022, the largest increase since October 2005.

Prices for new vehicles increased 11.4 percent over the year, prices for used cars and trucks were up 7.1 percent, while prices for motor vehicle parts and equipment increased 14.9 percent.

These data are from the Consumer Price Index program and are not seasonally adjusted. To learn more, see "Consumer Price Index — June 2022." Also see more charts related to the latest Consumer Price Index news release.

All items	3.4	6.5	7.0	1.4

Prices for four of the six major food at home groups increased from 2022 to 2023. Prices in the other food at home index increased the most, up 2.8 percent. This index includes food items such as candy, snacks, and sauces which are not classified in the other food categories. Cereals and bakery products prices and nonalcoholic beverages and beverage materials prices each increased 2.6 percent. Prices for fruits and vegetables rose 0.3 percent. Offsetting movements left prices for meats, poultry, fish, and eggs down 0.1 percent. Prices for meats, poultry, and fish were up 2.3 percent. Egg prices fell 23.8 percent, a downward adjustment following their 2022 price increase of 59.9 percent. Dairy and related products had the largest price decline among the major food at home groups, down 1.3 percent in 2023.

Energy prices decreased 2.0 percent in 2023, after increasing 7.3 percent in 2022. Fuel oil prices and utility gas service prices declined 14.7 percent and 13.8 percent, respectively, from December 2022 to December 2023. Gasoline prices declined 1.9 percent in 2023, following a decline of 1.5 percent in 2022. In contrast, electricity prices continued to increase, rising 3.3 percent in 2023 after increasing 14.3 percent in the prior year.

Costs for new vehicles increased 1.0 percent in 2023, compared with a 5.9-percent increase in 2022. Used cars and trucks prices declined 1.3 percent, following a decline of 8.8 percent the previous year. Motor vehicle insurance costs were 20.3 percent higher in December 2023 than in December 2022.

Prices for medical care rose 0.5 percent in 2023, following an increase of 4.0 percent in 2022. Nonprescription drug prices increased 8.3 percent after increasing 5.4 percent the previous year. From December 2022 to December 2023, costs for hospital and related services rose 5.6 percent and prescription drug prices increased 3.3 percent. Prices for physicians' services declined 0.6 percent over the year.

These data are from the Consumer Price Index program and are not seasonally adjusted. For more information, see "Consumer Price Index — December 2023." We also have more charts on consumer prices.

Attention

If you are reading this annual comprehensive financial report in its PDF format, there are links included within the document to make navigation easier.

- Page numbers and headings within the table of contents are linked to take readers to the appropriate page
- Starting in the Introductory Section, a table of contents button is located on the upper-right corner of each page to take readers back to the table
- Referenced pages within body text are linked to their stated page numbers
- Bookmarks are utilized in the document for all major headings and topics. If a bookmark has a + next to it, it can be clicked to open up a list of subheadings for that section
- External links are included to items referenced within the document, including links to State of Oregon documents

Tip: If readers wish to return to the original page they were on before clicking a link and want to avoid have to scroll back, it is helpful to enable the previous view button within Adobe Acrobat. If it isn't available on the navigation bar within the program, it can be enabled by right clicking the bar and selecting "page navigation" and clicking on "previous view." A new button on the bar will appear that can be clicked to return to the previous view. Alternatively, pressing Alt + Left Arrow (Windows) or Command + Left Arrow (Mac OS) will accomplish the same thing.

City Manager Steve Forrester

December 27, 2024

To the Honorable Mayor, City Councilors, Finance Committee Members and Citizens of Prineville, Oregon:

We hereby submit the Annual Comprehensive Financial Report (ACFR) of the City of Prineville (the "City") for the fiscal year ended June 30, 2024.

This report presents the financial position of the City as of June 30, 2024 and the results of its operations for the fiscal year then ended. The financial statements and supporting schedules have been prepared in accordance with generally accepted accounting principles (GAAP) in the United States of America and meet the requirements of the standards prescribed by the Oregon Secretary of State Audits Division. We believe the data, as presented, is accurate in all material respects and presented in a manner designed to fairly set forth the financial position and results of operations of the various funds of the City.

The accuracy of the City's financial statements and the completeness and fairness of their presentation is the responsibility of the City's management. The City maintains a system of internal accounting controls designed to provide reasonable assurance that assets are safeguarded against loss or unauthorized use, and that financial records can be relied upon to produce financial statements in accordance with GAAP. The concept of reasonable assurance recognizes that the cost of maintaining the system of internal accounting controls should not exceed benefits likely to be derived.

Pauly, Rogers, and Co. P.C., has issued an unmodified or "clean" opinion on the City's financial statements for the fiscal year ended June 30, 2024. The independent auditor's opinion is located at page 13 in the "Financial Section" of this report.

GAAP requires that management provide a narrative introduction, overview, and analysis to accompany the basic financial statements in the form of a Management's Discussion and Analysis ("MD&A"). This letter of transmittal is designed to complement the MD&A, and should be read in conjunction with it. The City's MD&A is located on page 17, immediately following the independent auditor's report.

Prineville and Its Services

Prineville is a community where citizens, civic organizations, businesses and city government work together to ensure that the community retains its hometown identity, high quality of life, and its natural beauty. The City incorporated in 1880, and today serves a population of 11,466. It is close to the region's business core and more urban amenities, with Bend approximately thirty miles to the southwest and the regional airport in Redmond approximately twenty miles west. The City provides a small-town atmosphere with its historic county courthouse building, other pioneer-era buildings and residential dwellings, and the contemporary architecture of newer homes. Prineville is the gateway to recreation in the Ochoco National Forest and Prineville Reservoir.

CITY FINANCE
387 NE Third Street – City of Prineville 97754
EMAIL: lhooper@cityofprineville.com
541.447.5627 ext. 1119 phone 541-447-5628 fax

The City is a full-service municipality that operates under a council/manager form of government. The elected Prineville City Council consists of a mayor and six councilors who act as the board of directors. The Council sets policies for city government, enacts ordinances and hires, and directs and evaluates the city manager. In turn, the city manager is the City's chief executive officer, responsible for overall management and administration.

Municipal services provided by the City include police, emergency dispatch, water and wastewater utilities, street operations, planning, engineering, railroad and freight depot facilities, golf course, and airport management services.

The Crook County Fire & Rescue District provides fire and emergency services to the community, the Crook County Parks and Recreation District provides parks and recreation services, and Crook County provides library services. Prineville is the county seat of Crook County.

Local Economy

The City's economy is linked with that of the entire Central Oregon region. Within the last fifteen years Facebook and Apple constructed major data centers in Prineville, which help to diversify the economy. Prineville serves as a hub-community for residents of Crook County, with significant commercial and industrial development. The top 10 largest employers in Prineville include Meta, Crook County School District, Les Schwab Distribution Facility, Endura Products, Crook County, St. Charles Health Systems, Ochoco National Forest, Bureau of Land Management, Western Heavy Haul / SMAF and the City of Prineville. Additionally, agriculture plays a significant cultural and economic role in Prineville.

The City has 15 companies taking advantage of tax abatements as of June 30th, 2024, which has affected the local economy in a positive way. These tax abatements offer a long-term benefit to the community through capital investments, higher wage jobs and community investment. Since the program was initiated, there have been over 2,660 jobs created, $11.8 billion in capital investments and any agreement over three years must pay employees at least 130 percent (130%) of the county's average wage. As of June 30th, 2024, 9 of the 15 active agreements qualified for the wage requirement. Crook County now has the third highest annual average wage of all 36 Oregon counties (all industries), behind only Washington and Multnomah.

Long-term Financial Planning

Long-term financial planning is performed on an ongoing basis. The City prepares 5-, 10- and 20- year financial plans for its General Fund, golf course, utilities and railroad, and is preparing various long-term financial analysis of its transportation system to inform decision makers. The financial plans include reserves by fund that fall within the policy guidelines set by the Prineville City Council and reviewed by the City's Finance Committee during the budget process. Reserve policy guidelines are measured as a percentage of annual operating expenses or current year revenues, and generally range between 15 percent (15%) and 25 percent (25%) depending on the fund.

The BN 25 budget was adopted in June of 2023. Water rates are anticipated to increase 2 percent (2%) year over year for the foreseeable future. Sewer rates are anticipated to fall in line with water rates with 2 percent (2%) year over year increases anticipated. Also included in the BN 25 budget was dollars for a facilitator to help with strategic planning and council goals. In line with strategic planning, fiscal policies will be updated in BN 25.

CITY FINANCE

EMAIL: lhooper@cityofprineville.com
541.447.5627 ext. 1119 phone 541-447-5628 fax

In regards to the City's long-term debt obligations, the City had a total of $18.8 million in long-term debt obligations including $15.1 million in full faith and credit obligations (FFCO) and a United States Department of Agriculture (USDA) bond for $3.6 million in federal funds as of June 30, 2024.

City's Credit Ratings

In August of fiscal year 2015, Standard and Poor's rating services affirmed the City's "A+" long-term rating. Their rationale was cited as the City has "strong financial management, very strong budgetary flexibility, very strong liquidity, strong budgetary performance, adequate debt and contingent liabilities, and a strong institutional framework." Our private lender for the FFCO in FY 19 for acquisition of the new public safety building stated in the approval letter, "We are once again impressed with the City's management and high credit quality." The City continues to maintain strong financial management, and has improved in all of the areas stated above in the Standard and Poor's comments for our rating in FY 15.

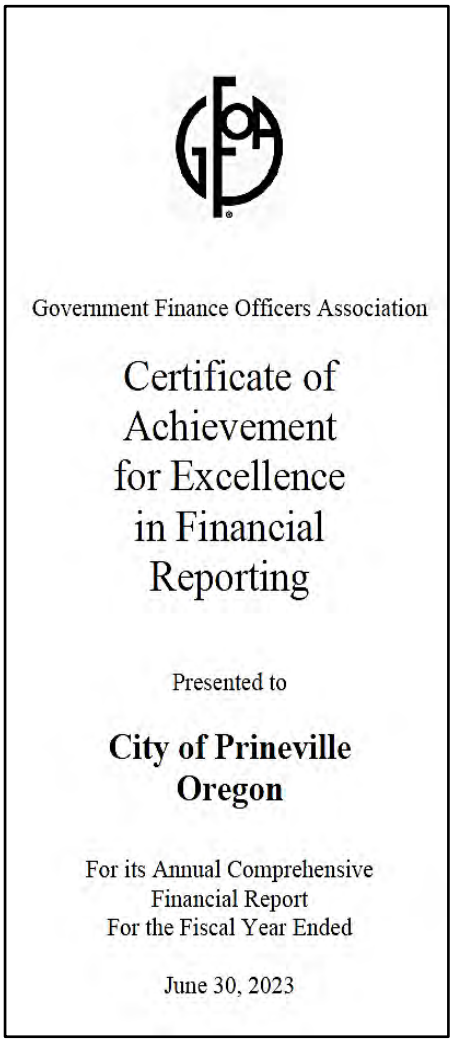
Major Initiatives

The City continues its incremental strategic planning process for the community and organization. The foundation has been established with the creation of a financial planning and decision-making framework for its major operations: water, wastewater, and transportation systems, police and emergency dispatch, railroad and freight facilities, and golf facilities. The Council and management are working toward clearly defined goals and objectives. During the budget review process, goals and objectives are developed and prioritized by the City Council and staff. The process is a continuing cycle of setting goals and objectives, reviewing short- and long-term goals, evaluating results, and reassessing the goals and their priority.

In preparing the budget for biennium 2025, the City Council updated and adopted various goals that were incorporated into budgeted operations. The City Council also established guidelines to achieve goals in the following major areas: urban and growth management, utility infrastructure, finances, downtown enhancement, recreation and culture, and partnerships with other agencies. Additionally, the City's Finance Committee, consisting of Mayor Jason Beebe and Councilors, Gail Merritt and Janet Hutchison, continue their focus on long-range financial stability, sustainability and audit oversight, and improving all finance processes.

Awards

Annual Comprehensive Financial Reporting Award. The City received the *Certificate of Achievement for Excellence in Financial Reporting* (CAEFR) award from the Government Finance Officers Association (GFOA) for its fiscal year 2023 report, making it the eighth time the City has applied and received the award. The CAEFR is a prestigious national award that recognizes conformance with the highest standards



Government Finance Officers Association

Certificate of Achievement for Excellence in Financial Reporting

of preparation of state and local government financial reports. In order to receive this award, government unit must publish an easily readable and efficiently organized ACFR whose contents conform to program standards and satisfy both accounting principles generally accepted in the United States of America and applicable legal requirements.

Distinguished Budget Presentation Award. The City submitted and received the *Distinguished Budget Presentation Award* for its BN 23-25 budget document from the GFOA. This is the 18th consecutive City budget document to receive this award. The award is the highest form of recognition in governmental budgeting. Its attainment represents a significant accomplishment by a governmental entity, its financial staff, and its management. This international award program was first established in 1984 to encourage exemplary budgetary practices and to provide peer recognition for government finance officers who prepare budget documents. Budget proficiency is rated in four major categories: as a policy document, an operations guide, a financial plan and a communications device.

Acknowledgements

The preparation of this Annual Comprehensive Financial Report was a combined effort of the dedicated finance staff under the direction of Lori Hooper Antram. We wish to express our appreciation to everyone who contributed to the preparation of this report. Lastly, we wish to recognize the Mayor, Councilors, and the Finance Committee for their full support for maintaining the highest standards of professionalism in the management of the City's finances.

Respectfully submitted,

December 9, 2024

To the Honorable Mayor and Members of the City Council
City of Prineville

INDEPENDENT AUDITORS' REPORT

Report on the Audit of the Financial Statements

Opinions

We have audited the accompanying financial statements of the governmental activities, the business-type activities, each major fund, and the aggregate remaining fund information of City of Prineville, as of and for the year ended June 30, 2024, and the related notes to the financial statements, which collectively comprise the basic financial statements as listed in the table of contents.

In our opinion, the financial statements referred to above present fairly, in all material respects, the respective financial position of the governmental activities, the business-type activities, each major fund, and the aggregate remaining fund information of City of Prineville, as of June 30, 2024, and the respective changes in financial position and, where applicable, cash flows thereof for the year then ended in accordance with accounting principles generally accepted in the United States of America.

Basis for Opinions

We conducted our audit in accordance with the auditing standards generally accepted in the United States of America and the standards applicable to financial audits contained in *Government Auditing Standards*, issued by the Comptroller General of the United States. Our responsibilities under those standards are further described in the Auditors' Responsibilities for the Audit of the Financial Statements section of our report. We are required to be independent of City of Prineville to meet our other ethical responsibilities, in accordance with the relevant ethical requirements relating to our audit. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinions.

Responsibilities of Management for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with accounting principles generally accepted in the United States of America, and for the design, implementation, and maintenance of internal control relevant to the preparation and fair presentation of financial statements that are free from material misstatement, whether due to fraud or error.

In preparing the financial statements, management is required to evaluate whether there are conditions or events, considered in the aggregate, that raise substantial doubt about City of Prineville's ability to continue as a going concern for twelve months beyond the financial statement date, including any currently known information that may raise substantial doubt shortly thereafter.

Auditors' Responsibilities for the Audit of the Financial Statements

Our objectives are to obtain reasonable assurance about whether the financial statements as a whole are free from material misstatement, whether due to fraud or error, and to issue an auditors' report that includes our opinions. Reasonable assurance is a high level of assurance but is not absolute assurance and therefore is not a guarantee that an audit conducted in accordance with generally accepted auditing standards and *Government Auditing Standards* will always detect a material misstatement when it exists.

The risk of not detecting a material misstatement resulting from fraud is higher than for one resulting from error, as fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal control. Misstatements are considered material if there is a substantial likelihood that, individually or in the aggregate, they would influence the judgment made by a reasonable user based on the financial statements.

In performing an audit in accordance with generally accepted auditing standards and *Government Auditing Standards*, we:

- Exercise professional judgment and maintain professional skepticism throughout the audit.
- Identify and assess the risks of material misstatement of the financial statements, whether due to fraud or error, and design and perform audit procedures responsive to those risks. Such procedures include examining, on a test basis, evidence regarding the amounts and disclosures in the financial statements.
- Obtain an understanding of internal control relevant to the audit in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the City of Prineville's internal control. Accordingly, no such opinion is expressed.
- Evaluate the appropriateness of accounting policies used and the reasonableness of significant accounting estimates made by management, as well as evaluate the overall presentation of the financial statements.
- Conclude whether, in our judgment, there are conditions or events, considered in the aggregate, that raise substantial doubt about the City of Prineville's ability to continue as a going concern for a reasonable period of time.

We are required to communicate with those charged with governance regarding, among other matters, the planned scope and timing of the audit, significant audit findings, and certain internal control-related matters that we identified during the audit.

Required Supplementary Information

Accounting principles generally accepted in the United States of America require that the management's discussion and analysis, and required supplementary information, as listed in the table of contents, be presented to supplement the basic financial statements. Such information is the responsibility of management and, although not a part of the basic financial statements, is required by the Governmental Accounting Standards Board, who considers it to be an essential part of financial reporting for placing the basic financial statements in an appropriate operational, economic, or historical context. We have applied certain limited procedures to the required supplementary information in accordance with auditing standards generally accepted in the United States of America, which consisted of inquiries of management about the methods of preparing the information and comparing the information for consistency with management's responses to our inquiries, the basic financial statements, and other knowledge we obtained during our audit of the basic financial statements. We do not express an opinion or provide any assurance on the information because the limited procedures do not provide us with sufficient evidence to express an opinion or provide any assurance.

The budgetary comparison information presented as required supplementary information, is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the basic financial statements. Such information has been subjected to the auditing procedures applied in the audit of the basic financial statements and certain additional procedures, including comparing and reconciling such information directly to the underlying accounting and other records used to prepare the basic financial statements or to the basic financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the information is fairly stated, in all material respects, in relation to the basic financial statements as a whole.

Supplementary Information

Our audit was conducted for the purpose of forming opinions on the financial statements that collectively comprise the basic financial statements. The supplementary information, as listed in the table of contents, and the schedule of expenditures of federal awards, as required by Title 2 U.S. Code of Federal Regulations (CRF) Part 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, are presented for purposes of additional analysis and are not a required part of the basic financial statements. The supplementary information, as listed in the table of contents, is the responsibility of management and was derived from and relates directly to the underlying accounting and other records used to prepare the basic financial statements. Such information has been subjected to the auditing procedures applied in the audit of the basic financial statements and certain additional procedures, including comparing and reconciling such information directly to the underlying accounting and other records used to prepare the basic financial statements or to the basic financial statements themselves, and other additional procedures in accordance with auditing standards generally accepted in the United States of America. In our opinion, the supplementary information, as listed in the table of contents, and the schedule of expenditures of federal awards are fairly stated, in all material respects, in relation to the basic financial statements as a whole.

Other Information

Management is responsible for the other information included in the annual report. The other information comprises the other information, as listed in the table of contents, the introductory, statistical, and the compliance and other reports sections as listed in the table of contents, and the listing of board members containing their term expiration dates, located before the table of contents, but does not include the basic financial statements and our auditors' report thereon. Our opinions on the basic financial statements do not cover the other information, and we do not express an opinion or any form of assurance thereon.

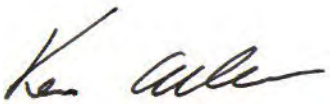
In connection with our audit of the basic financial statements, our responsibility is to read the other information and consider whether a material inconsistency exists between the other information and the basic financial statements, or the other information otherwise appears to be materially misstated. If, based on the work performed, we conclude that an uncorrected material misstatement of the other information exists, we are required to describe it in our report.

Report on Other Legal and Regulatory Requirements

In accordance with *Government Auditing Standards*, we have also issued our report dated December 9, 2024 on our consideration of the internal control over financial reporting and on our tests of compliance with certain provisions of laws, regulations, contracts, and grant agreements and other matters. The purpose of that report is to describe the scope of our testing of internal control over financial reporting and compliance and the results of that testing, and not to provide an opinion on the effectiveness of the internal control over financial reporting or on compliance. That report is an integral part of an audit performed in accordance with *Government Auditing Standards* in considering internal control over financial reporting and compliance.

In accordance with Minimum Standards for Audits of Oregon Municipal Corporations, we have issued our report dated December 9, 2024, on our consideration of compliance with certain provisions of laws and regulations, including the provisions of Oregon Revised Statutes as specified in Oregon Administrative Rules. The purpose

of that report is to describe the scope of our testing of compliance and the results of that testing and not to provide an opinion on compliance.



Kenneth Allen, CPA
Municipal Auditor
PAULY, ROGERS AND CO., P.C.

Management's Discussion and Analysis (MD&A) is presented to facilitate financial analysis and provide an overview of the financial activities of the City of Prineville (the "City") for the fiscal year ended June 30, 2024. Information in the MD&A is based on currently known facts, decisions and conditions. Please read the MD&A in conjunction with the basic financial statements and the accompanying notes.

Financial Highlights

The City's assets and deferred outflows of resources totaled $163.3 million at June 30, 2024, consisting of $121.8 million in capital assets, $28.1 million in cash and investments, $303,000 in restricted cash and investments, $9.2 million in other assets, and $3.9 million deferred outflows of resources. Total assets and deferred outflows of resources increased by $12.5 million from the previous fiscal year.

The City's liabilities and deferred inflows of resources totaled $44.2 million at June 30, 2024 consisting of $25.8 million in long-term liabilities, $14.5 million in accounts payable and other liabilities, and $3.9 million in deferred inflows related to pensions and leases.

The assets and deferred outflows of resources of the City exceeded its liabilities and deferred inflows of resources by $119.2 million at the close of fiscal year 2024, an increase of $13.6 million over the prior year. Unrestricted net position totaled $10.9 million with the remainder of the City's net position invested in capital assets totaling $103.9 million, capital projects $224,000, streets and highways $3.3 million, and debt service reserve $945,000.

For governmental activities, the City generated $1.1 million in fees and charges for services and received $3.3 million in operating grants and contributions. Direct expenses, including interest on long-term debt for governmental activities were $16.0 million for the year, resulting in a net direct expense of $11.6 million. Receipt of $15.1 million in general revenues and $3.8 million in transfers resulted in a change in net position of $7.2 million.

For business-type activities, the City generated $17.0 million in fees and charges for services. Capital grants and contributions to fund direct expenses totaled $1.7 million. Expenses for business-type activities totaled $8.8 million resulting in a change to net position of $6.3 million.

Fund balance in the City's governmental funds was $14.4 million at June 30, 2024, an increase of $5.7 million from June 30, 2023.

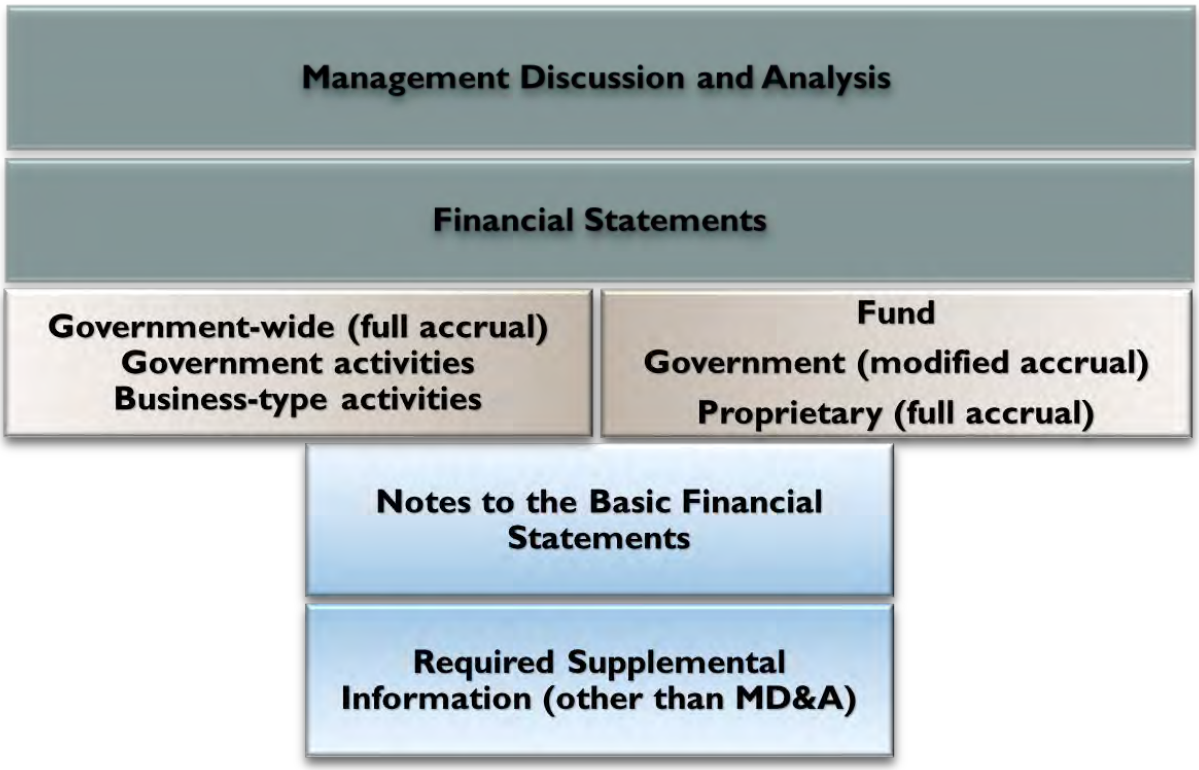
The City's total long-term debt decreased $1.8 million during the fiscal year ended June 30, 2024. Debt per capita decreased from $1,819 to $1,638 (-9.9%), using the City population of 11,466. The population increased by 115 from 11,351 according to the Portland State University preliminary population report as of on July 1, 2024.

Overview of the Financial Statements

In addition to this discussion and analysis, the financial section of this annual report contains the *basic financial statements, required supplementary information,* and *other supplementary information*, including the *combining statements and schedules* of the non-major funds.

The basic financial statements also include *notes* that explain the information in the financial statements and provide additional details. The following chart illustrates how the various sections of this report are arranged to one another.

Required Elements of the Annual Comprehensive Financial Report



Government-wide Financial Statements

The G*overnment-wide Financial Statements* are designed to provide readers with a broad overview of the City's finances, in a manner similar to a private-sector business.

The *Statement of Net Position* presents information on all City assets, deferred outflows of resources, liabilities and deferred inflows of resources, with the difference reported as *net position*. Over time increases or decreases in the net position may serve as a useful indicator of whether the financial position of the City is improving or deteriorating.

The *Statement of Activities* presents information showing how the City's net position changed during the fiscal year ended June 30, 2024. Changes in net position are reported when the underlying event giving rise to the change occurs, regardless of the timing of the related cash, or other financial assets, flows. Thus, revenues and expenses are reported in this statement for some items – such as property taxes and accrued vacation – that will result in cash flows in future fiscal periods.

Each of these government-wide financial statements, *Statement of Net Position* and *Statement of Activities,* distinguish functions of the City that are supported primarily by taxes and inter-governmental revenues (*government activities)* from other functions that are intended to recover all – or a significant portion of – their cost through user fees and charges (*business-type activities).* The governmental activities of the City include general government, public safety, highways and streets, and interest on long-term debt. The business-type activities include railroad, golf, airport, and public works, including water and wastewater.

The City's government-wide financial statements begin on page 31 and the government-wide financial policies are included in the notes to financial statements.

Fund financial statements. A *fund* is a grouping of related accounts that is used to maintain control over resources that have been segregated for specific activities or objectives. The City of Prineville, like other state and local government entities, uses fund accounting to ensure and demonstrate compliance with finance-related legal requirements. Each of the funds of the City is classified in one of three categories: government funds, proprietary funds and fiduciary funds.

Governmental funds. *Governmental funds* are used to account for essentially the same functions as *governmental activities* in the government-wide financial statements. However, unlike the government-wide financial statements, government fund financial statements focus on *near term inflows and outflows of spendable resources,* as well as on *balances of spendable resources* available at the end of the fiscal year. Such information may be useful in evaluating a government's near-term financing requirements.

Because the focus of governmental funds is narrower than that of the government-wide financial statements, it is useful to compare the information presented for *governmental funds* with similar information presented for *governmental activities* in the government-wide financial statements. By doing so, readers may better understand the long-term impact of the government's near-term financing decisions. Reconciliations from the *Government Funds Balance Sheet to the Government-wide Statement of Net Position* and from the *Government Funds Statement of Revenues, Expenditures and Changes in Fund Balances to the Government-wide Statement of Activities* are included in this report.

The City reported activity in five individual governmental funds and three internal service funds performing governmental activities during the fiscal year ended June 30, 2024. Information is presented separately in the *Governmental Funds Balance Sheet* and in the *Governmental Funds Statement of Revenues, Expenditures and Changes in Fund Balances* for the general fund and the City's other major funds (emergency dispatch, transportation, transportation system development charges, and pension obligation debt service). Data from all other governmental funds are combined into a single, aggregated presentation. Individual data for each of these non-major governmental funds, if applicable, is provided in the form of combining statements in the "Other Supplementary Data" section of this report and in the budget to actual comparison schedules.

The City adopts a biennial budget for each of its funds. A budget to actual schedule has been provided for each fund to communicate budgetary compliance.

The "Basic Governmental Fund Financial Statements" can be found on pages 31-38 of this report.

Proprietary funds. The City maintains two types of proprietary funds. Enterprise funds are used to report the same functions as business-type activities in the government-wide financial statements. The City uses enterprise funds to account for its railroad and freight depot, water, wastewater, airport, and golf fund. Internal service funds are used to report the administrative and facility operations of the City where charges for services are primarily recovered from other operations and functions of the City.

Proprietary funds financial statements provide similar, but more detailed, information as the government-wide financial statements. The proprietary fund financial statements provide information separately for the Railroad and Freight Depot, Water, Wastewater, Airport, and Golf Funds.

The "Basic Proprietary Funds Financial Statements" can be found beginning on page 39.

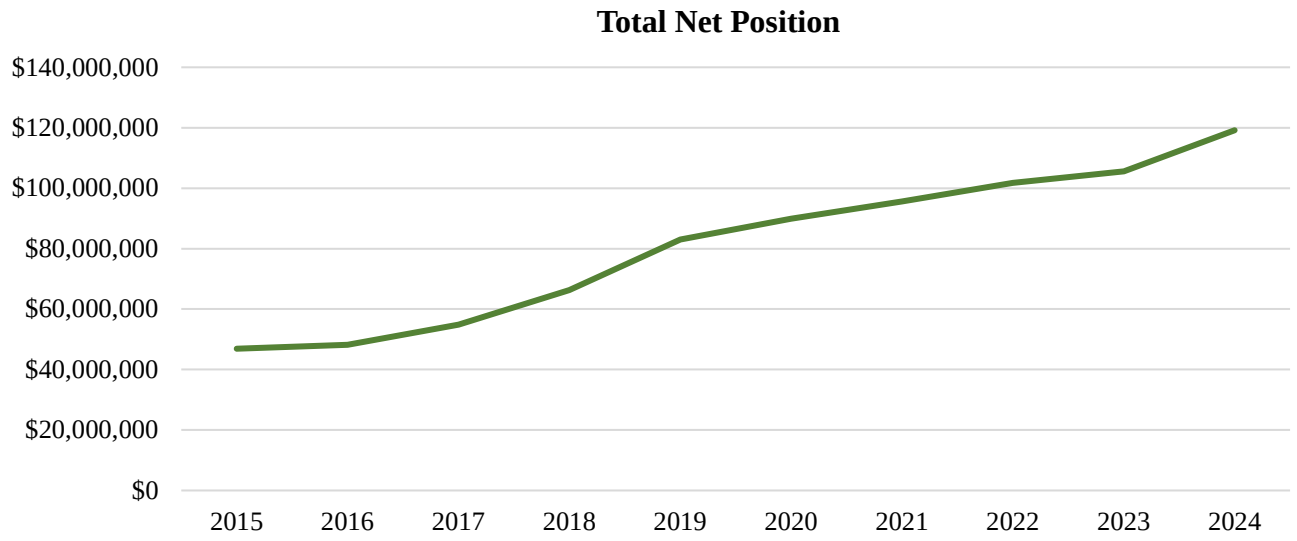
Notes to the financial statements. The notes provide additional information that is essential to a full understanding of the data provided in the government-wide and fund financial statements. The notes to the financial statements begin on page 45. The combining statements referred to above in connection with non-major governmental funds and business-type funds are presented in the "Additional Supplementary Information" section of this report.

Statement of Net Position

Net position, at a specific point in time, serves as a useful indicator of an entity's financial position. In the case of the City, assets and deferred outflows of resources exceed liabilities and deferred inflows of resources by $119.2 million at June 30, 2024.

The City's net position is heavily allocated to its investment in capital assets (land, infrastructure, buildings and equipment) less the related outstanding debt issued to acquire those capital assets and accumulated depreciation, $103.9 million, 87 percent (87.1%) of total position. The City's net investments in capital assets for water and wastewater utilities represent approximately 64 percent (64.0%) of total net investment in capital assets.

- The net position of the governmental funds equaled $37.4 million, an increase of $7.2 million or 24 percent (24.0%) over the prior year-end net position.
- The net position in the water utility totaled $39.4 million, an increase of $5.2 million or approximately 15 percent (15.2%) over the prior year-end net position.
- The net position in the wastewater utility totaled $31.3 million, an increase of $1.2 million or roughly 4 percent (4.2%) from the prior year-end net position.
- The net position in the railroad totaled $7.5 million, a decrease of $12,000 over prior year, or -0 percent (-0.2%) from the prior year-end net position.
- The net position in the Golf Course Fund totaled $3.5 million, an increase of $55,000 or roughly 2 percent (1.6%) over the prior year-end net position.



The City's net position includes approximately $4.4 million (3.7%) that is restricted. This restricted portion is for debt service of $945,000, transportation operations of $3.3 million and capital projects of $224,000. The unrestricted portion of the City's net position is $10.9 million and may be used to meet the City's ongoing obligations to citizens and creditors.

Net Position at June 30, 2024 and 2023

	Governmental activities		Business-type activities		Total	
	2024	2023	2024	2023	2024	2023

Restricted	3,269,733	2,025,707	1,169,272	909,699	4,439,005	2,935,406
Unrestricted	6,328,738	2,320,904	4,547,343	4,903,678	10,876,081	7,224,582
Total net position	37,420,719	30,176,016	81,751,732	75,415,914	119,172,451	105,591,930
Total net position, liabilities and deferred inflows	$ 65,753,964	$ 58,890,747	$ 97,594,905	$ 91,909,735	$ 163,348,869	$ 150,800,482

Overall, the City increased its net position by $13.6 million during fiscal year 2024 while also continuing to make investments in capital infrastructure, reduce its other outstanding debt obligations, and control operational spending. The $6.3 million increase in business-type activities can be largely attributed to capital investments made in water and wastewater infrastructure.

As of June 30, 2024, the City reports positive balances in all three categories of net position for the government.

Statement of Activities

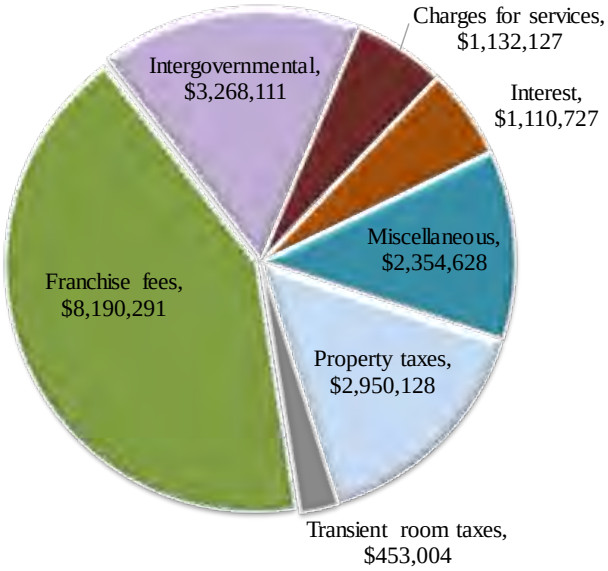
As with the *Statement of Net Position*, the City reports governmental activities on a consolidated basis.

Governmental activities increased Prineville's net position by $7.2 million during fiscal year ended June 30, 2024 as compared to an increase of approximately a $3.1 million in the prior year. Revenue increased by $4.5 million and expenses, excluding transfers, increased by $716,000. Key elements of these changes as illustrated in the summary of activities table on the next page are primarily the results of an increase of electrical franchise fees from data center activities, property tax, and interest and increases in public safety.

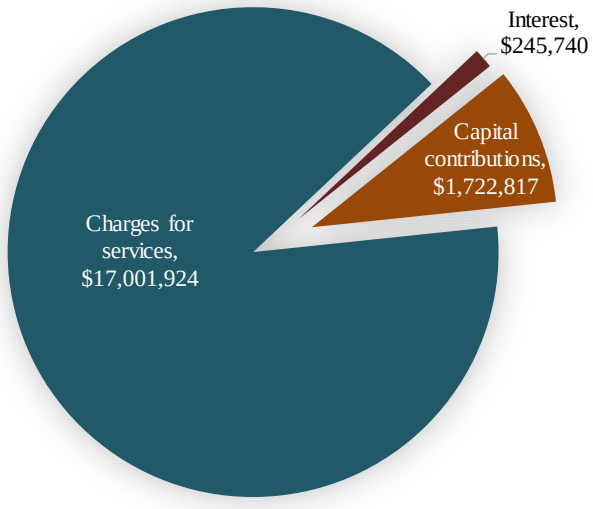
The revenues charted in the pie chart below in the sources for governmental activities include all program and general revenues for governmental activities such as property and transient room taxes, franchise fees, charges for services, intergovernmental revenue and miscellaneous revenues.

Business-type activities increased the City of Prineville's net position by $6.1 million. Water Fund revenues represent approximately 52 percent (52.2%) of total business-type revenue, with 95 percent (94.8%) of its revenue coming from charges for service. Charges for services in the Water Fund totaling $9.4 million are largely associated with metered water sales and reimbursements for water system expansion projects. The Wastewater Fund revenue represents approximately 32 percent (31.6%) of business activities with $4.5 million of the $4.8 million in charges for services coming from sewer utility charges. Capital contributions totaled approximately $1.7 million with $517,000 in the Water Fund and $1.2 million in the Wastewater Fund for developer installed water and sewer lines. Other business-type activities include the airport, railroad, and golf course. These activities represent approximately 15 percent (15.0%) of revenues during the year, and generally these revenues fall into the charges for service, and intergovernmental revenue areas.

Revenue by Source - Governmental Activities



Revenue by Source - Business-type Activities



A summary of the *Statement of Activities* follows:

	Governmental Activities		Business-type Activities		Total		
	2024	2023	2024	2023	2024	2023	Change

Financial Analysis of Prineville's Funds

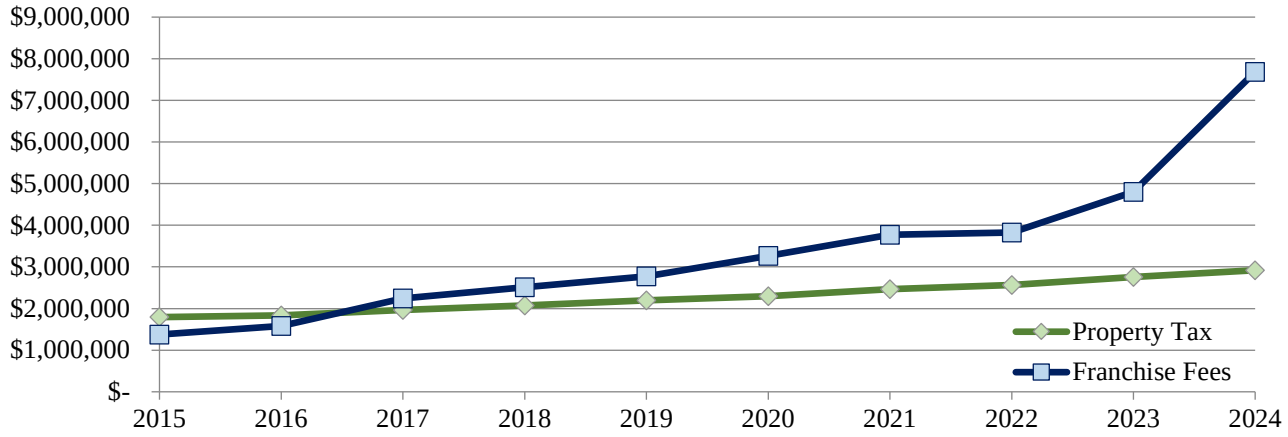
The City of Prineville uses fund accounting to ensure and demonstrate compliance with finance-related legal requirements.

Governmental funds. The focus of the City of Prineville's governmental funds is to provide information on near-term inflows, outflows and balances of available resources. Such information is useful in assessing Prineville's financing requirements. In particular, unassigned fund balance may serve as a useful measure of a government's net resources available for spending as of the end of the fiscal year.

As of June 30, 2024, $14.4 million is the reported combined ending fund balance for the City of Prineville's governmental funds, an increase of approximately $5.7 million from June 30, 2023. The increase is primarily the result of increases in electrical franchise fees in the General Fund. In emergency dispatch, the fund balance continued to increase with open position unable to be filled. In the Transportation SDC Fund, Oregon House Bill 5006 grants for the Peters Road to Combs Flat Road extension contributed to the increase in fund balance. In the Pension Obligation Debt Service Fund, increases can be attributed to the City maintaining transfers in at a level to build fund balance for creating another Oregon Public Employees Retirement System (PERS) side account in the future. Net increases or decreases in fund balance are as follows:

General Fund/Community Development	$ 3,602,013	103%
Emergency Dispatch	$ 501,832	36%
Transportation Fund	$ 137,572	20%
Transportation SDC Fund	$ 1,106,454	84%
Pension Debt Service Fund	$ 363,099	20%

General Fund Budgetary Highlights. The General Fund is the chief operating fund of the City. As of June 30, 2024, total fund balance was $7.1 million, an increase of $3.6 million (103.3%) from prior year. Within the General Fund ending balance, $6.8 million is considered unassigned. General Fund actual current year resources were $13.3 million for the first half of the 2023-2025 biennium. There were no expense categories that exceeded the biennial budget in the General Fund. Interest and miscellaneous revenues have outpaced the two-year budget in year one. The largest contributing factors to this are the Local Government Investment Pool interest coming in higher than anticipated and having more cash on hand due to increased collection in electrical franchise fees. In miscellaneous revenue the Chamber of Commerce gave the City a grant for street lighting for around the new justice center that was not anticipated at the time of budgeting. Police department expenses totaled $5.0 million with $4.1 million coming from personnel services and approximately $310,000 spent on outfitting six new police cars and motor vehicle maintenance. In non-departmental, spending was at $1.0 million with $167,000 in transient lodging taxes going to the chamber of commerce and $689,000 going to support the biomass project. Total General Fund expenditures were $6.0 million. The General Fund ended year one of the biennium budget with revenues exceeding expenditures by $7.3 million. Fund balance increased through the year largely due to the unanticipated revenue collection associated with increased electrical franchise fees with data center buildings coming back online after renovations. The graph below shows General Fund property tax collection and electrical franchise fee trends from 2015 through 2024.



Emergency Dispatch. The Emergency Dispatch Fund balance increased roughly $502,000. In FY 24, dispatcher vacancies continued to be difficult to fill and the under staffing contributed to the increases in fund balance. Call taker positions were added in FY 24 to try and relieve some of the dispatchers work load and to add a step before

becoming a dispatcher, but those positions have also been difficult to fill. At the end of FY 24 the E911 Director was working with the community college to help improve recruiting efforts.

Transportation and Transportation SDC Funds. Fund balance increased $138,000 in the Transportation Fund. The fund balance increase is largely attributed to Oregon State Gas Taxes coming in higher than expected with travel increasing with the end of the pandemic. In the Transportation SDC Fund, the fund balance increased $1.1 million with cash on hand increasing interest revenue dramatically due to $9.9 million in grants that were distributed up front before the projects they were funding started. The grant funded projects for the completion of the N Main Street and NE Peters Road safety improvements and the preliminary work for Combs Flat Extension project (pictured below) made up the capital spending in the Transportation SDC Fund.

Pension Debt Service Fund. Fund balance increased $363,000 in the Pension Debt Service Fund to $2.2 million. This was anticipated as reserves are being built up to be used for accrued liabilities associated with payroll and to stabilize PERS rates in the future.

Proprietary funds. The focus of the City's proprietary funds is to provide information on the financial performance, i.e., ability for each fund to recover full costs of the services provided. Such information is useful in assessing Prineville's ability to continue to provide those services on a sustainable basis.

As of June 30, 2024, the City realized an increase in net position of $6.3 million for the combined performance of all proprietary funds. Operating revenues over operating expenses from combined proprietary funds are $8.4 million, contributing to an overall increase in net position. The biggest factor to the increase in net position was the impact of capital contributions in the Water and Wastewater Funds and operational profits in the Water Fund.

Railroad and Freight Depot Fund. The railroad's net position decreased slightly by $12,000 through the fiscal year. Operational revenues over expenses resulted in a profit of roughly $43,000 with depreciation contributing to 29 percent (29.4%) of the operational expenses. The railroad ended the year with a net position as of June 30, 2024 of $7.5 million. Operational revenue is up for the railroad in comparison to the prior year 13 percent (13.3%), with significant increases in switching and storage charges. Switching fees are charged to move cars into and from storage, so the charges are directly related. Freight depot charges for services are up over prior year by roughly 7 percent (7.2%), largely due to increased lease revenue from Heniff Transportation and Ed Staub and Son's and an increase in lumber customers utilizing the freight depot for storage. In FY 24, a used locomotive was purchased to help improve efficiencies and is expected to be put into operation in FY 25 (pictured below). Overall revenues over expenditures, including transfers out, have decreased the fund balance by $227,000 to $1.0 million.

Photo taken by Dade Shank

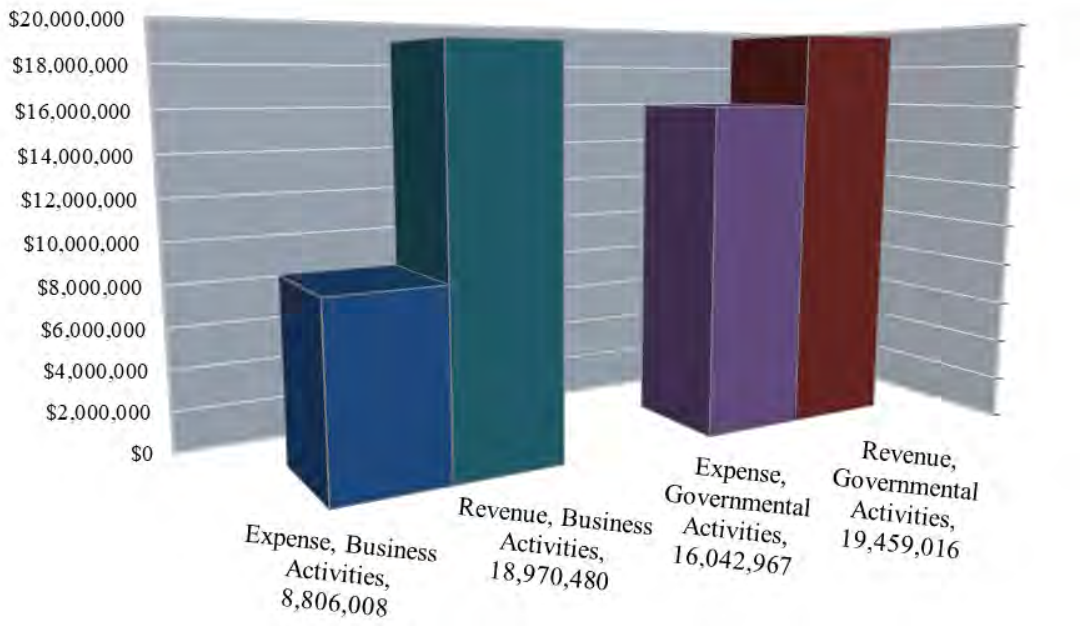
Golf and Restaurant Fund. The net position in golf increased $55,000 largely due to a budgeted transfer of $370,000 from the Wastewater Fund for operational support. Golf operational revenues in comparison to the prior year are up 14 percent (13.6%) with operational expenses up 19 percent (19.2%). Operational expenses are up primarily due to increased personnel and maintenance costs due to the increased activity. Operationally, the golf course finished the year strong with rounds of golf up by approximately 4,130 over the prior year. Fund balance decreased throughout the year $51,000, ending the year at $1.1 million.

Airport Fund. The airport's net position decreased $156,000 to $8,000. The airport is a collaboration effort between Crook County and the City. A new intergovernmental agreement (IGA) was put in place during FY 24 and the operations of the airport were leased out to a third party fixed based operator (FBO) starting in October 2023. The City's sole responsibility is now managing the manager of the airport and Crook County has taken the rest of the responsibilities. The IGA is set up in a way where the fund balance is to be at breakeven resulting in the fund balance at June 30, 2024 of roughly zero.

Water Fund. The net position of the Water Fund increased $5.2 million through the fiscal year, ending at $39.4 million on June 30th, 2024. The primary contributing factors for the increase of net position are due to capital contributions - system development charge collections, other operational revenues associated with reimbursements for water system expansions from data centers and operational profits. Water rates increased 3 percent (3%) in July of 2023. Overall metered water sales revenue was up in comparison to the prior year by 4 percent (4.0%) which can largely be attributed to the rate increases that were implemented during the year.

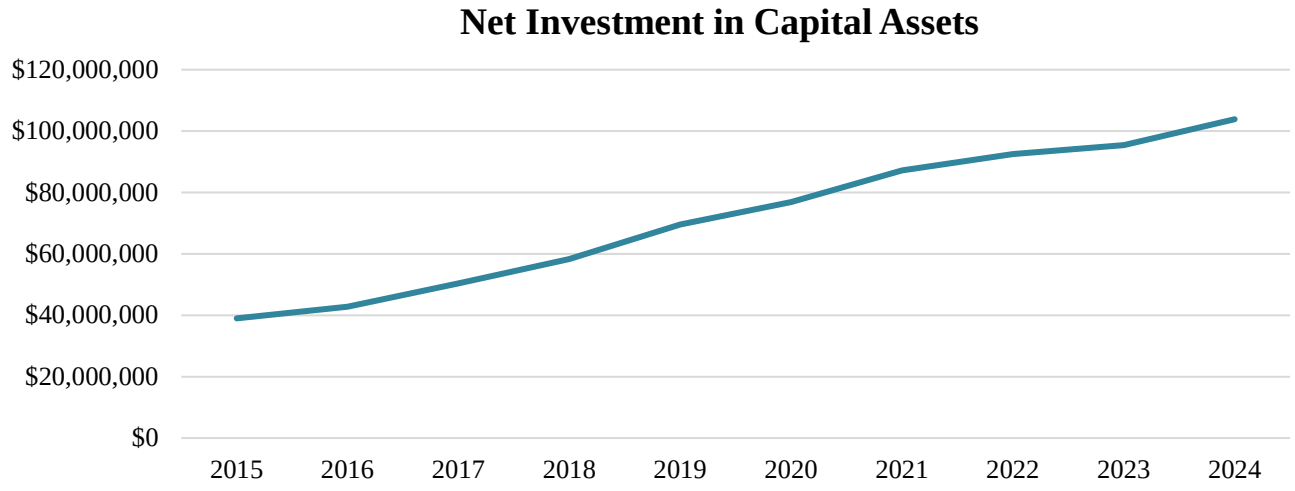
Wastewater Fund. In the Wastewater Fund, net position increased $1.2 million with operational profits of roughly $1.8 million. Wastewater charges for services are largely associated with customer utility charges totaling $4.5 million. This is an increase of 7 percent (7.0%) in comparison to the prior year largely due to an increases in connection charges as residential construction increased in FY 24 and rate increases. Sewer rates increased as of July 2023 by 3 percent (3%) and a master plan update for wastewater was started in FY 23 and was completed in FY 24.

The City continues to actively pursue additional business for the airport, railroad and freight depot operations. It has also adjusted its utility rates incrementally to recover total costs of operations and provide adequate funding for debt service and capital replacement and expansion.



Capital Asset and Debt Administration

Capital Assets. The City's net investment in capital assets for its governmental and business-type activities as of June 30, 2024 is $103.9 million. The investment in capital assets includes land, buildings, equipment and infrastructure such as roads, water and wastewater systems. The net increase in net capital assets for the year ended June 30, 2024 was $8.4 million.



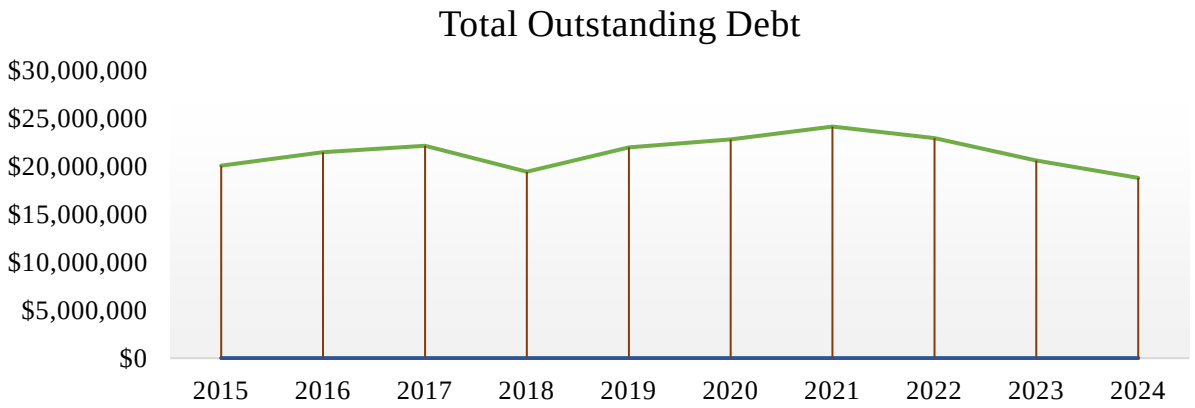
Additional information on capital assets is included in "Note 4" to the financial statements of this report on pages 60-62.

Long-term debt. As of June 30, 2024, the City's outstanding bonded debt was $18.8 million, $1.9 million less than at June 30, 2023. Of this, $15.1 million is backed by the full faith and credit of the City, which includes $4.7 million for obligations repaid with water, wastewater and golf revenues, $1.2 million refinanced note payable for pension obligation repaid from all funds with employees subject to Oregon Public Employees Retirement System retirement payments, $699,000 of refunded federal debt for the city hall building, $3 million in interim financing

through Business Oregon for the Aquifer Storage and Recovery project, an IFA loan for $594,000, a note payable for a street sweeper in the amount of $114,000 and $4.81 million for the remodel and adaptation of the new police facility. The City also had $3.6 million bond outstanding in wastewater with USDA for the wetlands. The City is liable for notes payable with government commitment if other revenues are insufficient to repay the debt. There are no debt requirements, commitments or other limitations required by debt holders that significantly affect the availability of resources for current or future use.

Schedule of Outstanding Long-term Debt
June 30, 2024 and June 30, 2023

	Governmental Activities		Business-type Activities		Total	
	2024	2023	2024	2023	2024	2023
Full faith and credit obligations			$ 4,723,388	$ 5,741,249	$ 4,723,388	$ 5,741,249
Water, golf and wastewater					-	-
Pension note payable	1,172,919	1,450,562			1,172,919	1,450,562
Federal debt			3,639,007	3,703,325	3,639,007	3,703,325
Oregon IFA / CWSRL			593,763	621,602	593,763	621,602
Other leases, SBITA's and notes payable	5,655,882	6,131,073	3,000,000	3,000,000	8,655,882	9,131,073
Totals	$ 6,828,801	$ 7,581,635	$ 11,956,158	$ 13,066,176	$ 18,784,959	$ 20,647,810



Additional information on the City's long-term debt is included in "Note 5" to the financial statements on pages 62-68.

Key Economic Factors and Budget Information for the Future, FY24 update

- ***Unemployment and real estate*** – Oregon's unemployment rate for FY24 began at 3.6%, had a high of 4.2% and ended 4.1%. Crook County began at 5.6%, had a high of 6.4% and ended at 6.1%; according to the Oregon Employment Department. As of October, FY24, Oregon unemployment has decreased to 4.0%, with Crook County decreasing to 5.6%, as the Federal Reserve signaled a couple of interest rates cuts through the end of the year countering years of rate increases to tackle high inflation caused by the pandemic. Unemployment has remained remarkably low and steady the last 3-years during this period of higher than normal inflation. Demand for goods and services remained steady due to high employment and a very significant increase in federal spending on infrastructure through the "Inflation Reduction Act". Supply chain issues have normalized and inflation has slowed nearing the Federal Reserve's 2% target. The Central Oregon region in general is attracting a significant amount of growth that will likely insulate the region from any significant economic downturn caused by a reversal in interest rate trends. At this time, it appears as though the economy will have a soft landing with slow intentional rate cuts through 2025; however, common economic assumptions that have guided investors, business and consumers prior

to the pandemic no longer seem to apply and the incoming Federal administration has prior history of being unpredictable.

- According to reports from the City's Realtor of Record, the median home sale price for Crook County through October 2024 is approximately $484,000. This is slightly higher than October 2023, but lower than the summer highs of $510,000. These prices are significantly higher than pre-pandemic prices that hovered around the $280,000 mark. Price increases were initially due to high demand that was compounded by material supply issues and inflationary costs of the last 3-years. Raising interest rates helped to curtail prices over the last few years with new and existing home sales declining, due to unwillingness to finance at higher rates and the Federal reserve signaling cuts at the end of 2024 and into 2025. As of November 2024, the Federal Reserve has cut rates by 75 basis points. With the demand for housing in the region we are unlikely to see a collapse of the market, though; the lack of new housing projects is a concern. For now, housing prices in Central Oregon have found a new floor that is significantly higher than pre-pandemic prices.

- Dwelling approvals for FY24 include 44 single family, 2 ADUs and a 17-unit manufactured home park that will not likely be built. No multi-family applications were received. This was a ~22% decrease in single-family approvals while multi-family was non-existent. The previous year's numbers are attributed to two large projects just now beginning to develop. Total dwelling approvals for FY16 – FY24 were 38, 76, 114, 229, 111, 88, 455, 378, 63 respectively. Through November of FY25 the City has seen 23 dwelling approvals. This is significantly higher than the 8 dwellings in the same time frame last year. Last year's prediction of approximately 40 single-family dwellings in FY24 proved accurate. Expectations for single family development in FY25 remain the same around 40 single family units, as existing developments build out. While FY25 may be on par with FY24 the lack of new applications for housing developments is concerning. Some of the housing pressure may subside, with the two large multi-family housing projects getting underway.

- ***Meta & Apple*** – In January 2010, Meta initiated their first 334,000 square foot data center. Since then Meta has completed 11 data centers buildings totaling approximately 5 million square feet with plans for expansion. In October 2012, Apple initiated construction of a 338,000 square foot data center. At this time the 3rd building has been completed and the first of 3 more are beginning development.

Residential, Commercial and Public development – Continued data center development, as well as a noticeable increase in commercial and industrial development has maintained a healthy economy even as residential development has declined due to high interest rates needed to combat inflation. At this time, it appears a national economic downturn may have been avoided. It is possible that in the event of a national downturn, Prineville will be somewhat insulated due to local and regional demand.

New commercial construction has continued on the Ochoco Mill site including a new carwash. The construction of the Justice Center and the museum expansion are complete. The Service commercial zone created in the airport industrial area in FY23 is under construction. Other commercial development has slowed with few new applications and serval small developments finishing through the winter.

Industrial development is still the bright spot in the community with continued development in the Tom McCall Business Park and continued interest in the Baldwin and Murphy Court Industrial Parks.

The Public sector has been extremely busy planning and implementing large infrastructure projects, such as the expansion of the City's Aquifer Storage and Recovery system (ASR), design of Peters Road intersection, Combs Flat extension and irrigation piping, 3rd St. rebuild, 30" water lines for industrial development, airport expansion and rail tie replacement.

PERS – As of December 31, 2023, the City has a funded ratio of 70 percent (70%) and has an unfunded actuarial liability (UAL) of $8.87 million, which reflects an increase of $1.34 million from December 31, 2022.

Effective July 1, 2023 through June 30, 2025, the City's PERS contribution rates for Oregon Public Service Retirement Plan (OPSRP) general service, OPSRP police and fire, and tier I / II are 14.62, 19.41 and 19.92 percent respectively. Rates for the 2025 – 2027 biennium were posted in September 2024 and were significantly higher than originally projected due to weak returns in investment in 2023. Final rates for OPSRP general service, OPSRP police, and fire and tier I / II are 21.19, 26.46 and 25.16 percent respectively.

Historically, PERS contribution rates have fluctuated based upon earnings, the amount of the City's UAL, and the percentage of the UAL to covered payroll. Generally, PERS rates have decreased as the City approached or exceeded full funding. In 2015, the Moro decision ruled unconstitutional affected the 2016 rate in a negative way increasing the City's UAL. However, the City received a 6 percent rate credit for the side account contribution in 2014 really stabilizing the contribution rate for the City.

To address the UAL on a long-term basis and provide stability to the City's retirement contributions, the City chose to take advantage of low interest rates (4.94%) and enter into a loan obligation of $2.95 million to be repaid over 15 years. The loan proceeds were invested with PERS in a side account, which resulted in reduced PERS contribution rates beginning in fiscal year 2016. The actuarial report show rates were reduced by -6 percent and a rate credit of 6 percent was received in FY 17. In 2018, the City refunded its pension obligation at a rate lower (3.70%) than the 2014 rate, keeping the same maturity and freeing the City from very constricting covenants. The current outstanding debt totals $1.17 million as of June 30, 2024. On March 25, 2019, the City made an $800,000 deposit to a new PERS side account receiving an additional 1.35 percent (1.35%) offset to our rate, additionally we able to receive the 25 percent (25%) matching funds from the State of Oregon totaling $200,000, this additional deposit was factored into the December 31, 2019 valuation and provided an additional rate decrease for the July 1, 2021 to June 30, 2023 rates. The City has been building up reserves to open up another side account to help provide additional rate relief. That reserve is at roughly $1.79 million as of June 30, 2024 and the new side account is anticipated to be opened in the summer of 2025.

See "Note 7" on pages 69-75 in the financial statements for additional discussion related to PERS.

Requests for Information

This financial report is designed to provide a general overview to those parties interested in Prineville's finances. Questions concerning the information provided in the report of requests for additional information should be addressed to the City's Finance department at 387 NE Third Street, Prineville, Oregon 97754.

City of Prineville

Reconciliation of the Balance Sheet of Governmental Funds to the Statement of Net Position

June 30, 2024

Amounts reported for governmental activities in the Statement of Net Position are different because:	
Fund balance - total governmental funds	$ 14,447,027
Capital assets used in governmental activities are not financial resources, and therefore, are not reported in funds.	31,587,343
Unavailable revenues are deferred on the budgetary financial statements, but in the government wide state they are considered revenues	897,488
The assets and liabilities of the internal service funds are included in governmental activities in the Statement of Net Position.	(3,978,264)
The Net Pension Asset (Liability), and deferred inflows and outflows related to the Net Pension Asset is the difference between the total pension liability and assets set aside to pay benefits earned to past and current employees and beneficiaries	(3,586,456)
Long-term liabilities, including bonds payable, financed purchases and accrued vacation, are not due and payable in the current period, and therefore, are not reported in the funds.	(1,588,684)
The OPEB GASB 75 Liability, and deferred inflows and outflows related to the OPEB GASB 75 Liability is the difference between the total pension liability and assets set aside to pay benefits earned to past and current employees and beneficiaries	(341,942)
Bond interest is not accrued as a liability in the government funds.	(15,793)
Net position of governmental activities	$ 37,420,719

City of Prineville

Reconciliation of Statement of Revenues, Expenditures and Changes in Fund Balance to the Statement of Activities
Governmental Funds
Year Ended June 30, 2024

Amounts reported for governmental activities in the statement of activities are different because:			
Net change in fund balances - total governmental funds		$	5,710,970
Governmental funds report capital outlay as expenditures. However, in the Statement of Activities the cost of those assets is allocated over their estimated useful lives and reported as depreciation expense. This is the amount by which capital outlay was less actual additions and depreciation expense			
Capital Outlay	3,086,556		
Depreciation expense	(1,439,114)		1,647,442
Revenues in the Statement of Activities that do not provide current financial resources and are not reported as revenue in the fund statements:			30,591
Internal service funds are used to account for all costs arising from the operations of the City's central services activities and insurance programs. The primary funding sources are charges to the other funds. This is the net gain of the funds for the year.			9,805
Long-term debt proceeds provide current financial resources to governmental funds, but issuing debt increases long-term liabilities in the Statement of Net Position. Repayment of long-term debt principal is an expenditure in the governmental funds, but the repayment reduces long-term liabilities in the Statement of Net Position. This is the amount by which debt proceeds exceeds principal payments:			286,963
The Pension Expense and the changes in deferred inflows and outflows related to the Net Pension Asset represents the changes in Net Pension Asset (Liability) from year to year due to changes in total pension liability and the fair value of pension plan net position available to pay pension benefits.			(475,243)
Some expenses reported in the Statement of Activities do not require the use of current financial resources, and therefore, are not reported as expenditures in governmental funds.			
Accrued interest	62		
Accrued compensated absences	43,013		
OPEB Liability GASB 75	(8,900)		34,175
Change in net position of governmental activites		$	7,244,703

1. Summary of Significant Accounting Policies

Reporting Entity

The City of Prineville is a municipal corporation, incorporated in 1880. It operates under its own charter with a council/manager form of government. The Prineville City Council, composed of the mayor and six council members, comprises the legislative branch of the government. The City Council appoints a city manager who serves as the administrative head of the entity. As required by GAAP in the United States of America, all significant activities of the City have been included in the basic financial statements. The City qualifies as a primary government since the City has a separately elected governing body, is a legally separate entity, and is fiscally independent. There are various governmental agencies and special service districts, which provide public services within the City's boundaries. The City is not financially accountable for any of these entities; therefore, none of them are considered component units, nor are they included in these financial statements.

Government-wide and Fund Financial Statements

The government-wide financial statements, the *Statement of Net Position* and the *Statement of Activities*, report information on all of the City's activities. For the most part, the effect of interfund activity has been removed from the government-wide statements. An exception to this is services or goods provided by an activity and used by another activity. Governmental activities, which are primarily supported by taxes and intergovernmental revenues, are segregated from business-type activities, which are primarily supported by charges for services and fees.

The *Statement of Activities* demonstrates the degree to which the direct expenses of a given activity are offset by program revenues. Direct expenses are those that are clearly identifiable with a specific activity. Program revenues include charges to customers or applicants who purchase, use or directly benefit from goods, services, or privileges provided and capital grants and contributions that are restricted to meeting the operational or capital requirements of a particular activity. Indirect expenses are recovered through internal service fund charges. These indirect expenses are allocated based on a full-cost approach, thereby allocating indirect expenses among functions with the objective of allocating all expenses. Taxes and other revenues that are not properly included among program revenues are reported as general revenues.

Separate financial statements are provided for governmental and proprietary funds. Major individual governmental funds and major individual enterprise funds are reported as separate columns in the fund financial statements.

The City reports the following major governmental funds:

General fund – This fund accounts for the activity of the police department and non-departmental activities. Additionally, activity accounted for in a sub-fund for community development is combined with the general fund for financial statement presentation.

Emergency dispatch fund – Accounts for the emergency dispatch services provided to all public safety agencies within Crook County. Resources include a transfer from the Prineville Police Department, 911 telephone taxes administered by Crook County, and the other public safety agencies utilizing the services.

Transportation fund – Accounts for the City's transportation systems, including street, sidewalk and bike paths, operations and maintenance. The primary revenue source is the state gas tax allocated to cities.

1. Summary of Significant Accounting Policies (continued)

Transportation SDC fund – Accounts for the receipt and expenditures of system development charges (SDC) that are dedicated for transportation system expansion improvements.

Pension obligation debt service fund – Accounts for the payment of debt issued to fund a pension retirement unfunded actuarial liability, and other governmental accrued liabilities. The primary revenue source is a charge to all City funds that have employees with earnings subject to OPERS retirement contributions.

Major Proprietary funds are:

Railroad fund – Accounts for the operation and maintenance of the City's railroad and freight depot operations. The primary source of revenue is charges for services to utilize the rail system and storage facilities.

Water fund – This fund accounts for the operation and maintenance of water service and distribution facilities. The principal source of revenue is charges for water consumption. Additionally, a water SDC sub-fund, which accounts for the receipt and expenditures of system development charges that are dedicated for water system expansion improvements, is consolidated for reporting purposes.

Wastewater fund – This fund accounts for the operation and maintenance of the wastewater collection and treatment system. The principal source of revenue is charges for service. Additionally, a wastewater SDC sub-fund, which accounts for the receipt and expenditures of system development charges that are dedicated for wastewater system expansion improvements, is consolidated to the wastewater fund for financial reporting purposes.

Golf course fund – Accounts for the operation and maintenance of the golf course, restaurant and wastewater treatment. The principal sources of revenue are green fees, cart rentals, food and beverage sales, and charge to the wastewater fund.

Additionally, the City reports the following:

Internal Service Funds

Internal service funds account for services provided for departmental units within the City.

Services provided by the internal service funds include facility maintenance, fleet maintenance, technology and communications, administrative services, and risk management. The cost of the services provided is recovered by charges to the department receiving the service. The reporting for the internal service funds are consolidated in the reporting of the proprietary statements.

Administrative services fund – Accounts for the City Council, city manager's office, finance department and information technology operations. The principal source of revenue is charges to City departments and operations.

Building facilities fund – Accounts for the operations, maintenance, debt service and replacement costs of the city hall building, public works building, police department facilities, Barnes Butte property, and the senior center project. The principal source of revenue is rent, and grants.

1. Summary of Significant Accounting Policies (continued)

The Plaza Maintenance sub-fund is combined with the building facilities for financial statement presentation.

Public works support services fund - Accounts for the public works department staff and vehicle/equipment maintenance operations. The principal source of revenue is charges to City operations utilizing public works staff, such as water, wastewater, and streets.

Non-major Funds

The City also reports the following non-major funds:

Non-major Governmental Funds

Special Revenue Funds

Community development fund – Accounts for the City's community development and planning activities. The principal sources of revenue are planning fees and charges and transfer from the general fund. This fund is combined with the general fund.

Non-major Proprietary Funds

Airport fund – Accounts for the operation of the Prineville-Crook County Airport. The City operates the County-owned airport as provided in an intergovernmental agreement. Principal sources of revenue include fuel sales, and hangar, building and ground leases.

Internal Service Fund

Plaza maintenance fund - Accounts for the operation of the plaza located between city hall and a county office building. Principal sources of revenue include intergovernmental revenue from Crook County and City payments. This sub-fund is combined with the building facilities fund.

The City's government-wide and proprietary statements are based on all applicable Governmental Accounting Standards Board (GASB) pronouncements.

Interfund transfers, interfund services provided and used, interfund reimbursements and interfund payables and receivables are all interfund activities. The effect of interfund activities and administrative charges are eliminated from the government-wide financial statements. Interfund services that are provided and used are not eliminated from the government-wide statements since elimination would distort the program revenues and direct costs of the City's functions.

Amounts reported as program revenues in the government-wide statement of activities include: fees, charges to users for services provided, goods produced or privileges provided; operating grants and contributions; and capital grants and contributions. Taxes, grants and contributions that are not restricted are reported as general revenues. Transient room taxes and franchise fees are based on gross receipts and are reported as general revenues.

1. Summary of Significant Accounting Policies (continued)

Proprietary funds distinguish operating revenues and expenses from non-operating items. Operating revenues and expenses generally result from providing services and producing and delivering goods in connection with a proprietary fund's primary ongoing operations. The primary operating revenues of the water fund, wastewater fund, railroad fund, golf and restaurant fund, and airport fund are charges to customers for sales and services. The primary revenue of the City's internal service funds are charges for services to other City funds, received in the form of transfers.

The water fund and wastewater fund also receive fees, which are intended to recover the cost of providing new customers to the utility systems. Operating expenses for the proprietary funds include the cost of sales and services, administrative expenses, and depreciation. All revenues and expenses not meeting this definition are reported as non-operating revenues and expenses.

Measurement Focus and Basis of Accounting

Measurement focus is a term used to describe which transactions are recorded within the various financial statements. Basis of accounting refers to when transactions are recorded. The government-wide financial statements are presented on a full-accrual basis of accounting with an economic resource measurement focus, as are the proprietary fund financial statements. An economic resource focus concentrates on an entity or fund's net position. All transactions and events that affect the total economic resources (net position) during the period are reported. An economic resources measurements focus is inextricably connected with full accrual accounting. Under the full accrual basis of accounting, revenues are recorded when earned and expenses are recorded at the time liabilities are incurred, regardless of the timing of related cash inflows and outflows.

Governmental fund financial statements are presented on a modified accrual basis of accounting with a current financial resource measurement focus. The measurement focus concentrates on the fund's resources available for spending currently or in the near future. Only transactions and events affecting the fund's current financial resources during the period are reported. Similar to the connection between an economic resource measurement focus and full accrual basis of accounting, a current financial resource measurement focus is inseparable from a modified accrual basis of accounting. Under the modified accrual basis of accounting, revenues are recognized when susceptible to accrual (i.e., when they become measurable and available). Measurable means the amount of the transaction can be determined and revenues are considered available when they are collected within the current period or expected to be collected soon enough thereafter to be used to pay liabilities of the current period. For this purpose, the City considers revenues to be available if they are collected within 60 days of the end of the current fiscal period. Revenues considered susceptible to accrual are property taxes, state, county and local shared revenues, franchise taxes, intergovernmental revenues, and investment income.

An unearned revenue liability arises on the balance sheets of the governmental funds when potential revenue does not meet both the measurable and available criteria for recognition in the current period. This unavailable revenue consists primarily of uncollected property taxes not deemed available to finance operations of the current period. In the government-wide statement of activities, with a full accrual basis of accounting, revenue must be recognized as soon as it is earned regardless of its availability. Thus, the liability created on the balance sheets of the governmental funds for unavailable revenue, is eliminated. Similar to the way its revenues are recorded, governmental funds only record those expenditures that affect current financial resources. However, debt service expenditures, as well as expenditures related to compensated absences and claims and judgments, are recorded only when payment is due. In the government-wide financial statements, however, with a full accrual basis of accounting, all expenses affecting the economic resource status of the government are recognized.

1. Summary of Significant Accounting Policies (continued)

Since the governmental fund statements are presented on a different measurement focus and basis of accounting than the government-wide statements' governmental column, a reconciliation is necessary to explain the adjustments needed to transform the fund based financial statements into the governmental column of the government-wide presentation. This reconciliation is part of the basic financial statements.

Proprietary funds distinguish operating revenues and expenses from non-operating items. Operating revenues and expenses generally result from providing services, and producing and delivering goods in connection with a proprietary fund's principal ongoing operations. Operating expenses for the proprietary funds include the cost of sales and services, administrative overhead, and depreciation on capital assets. All revenues and expenses not meeting this definition are reported as non-operating revenues and expenses.

Use of Estimates

The preparation of financial statements, in conformity with accounting principles generally accepted in the United States of America, requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities, disclosure of contingent assets and liabilities at the date of the financial statements, and reported amounts of revenues and expenditures/expenses during the reporting period. Actual results may differ from those estimates.

Assets, Liabilities, Deferred Outflows/Inflows of Resources and Equity

Assets Liabilities and Net Position

Cash and Investments

State statutes authorize the City to invest in obligations of the U.S. Treasury, certificates of deposit, U.S. government agency securities, instrumentalities of U.S. government-sponsored corporations, commercial paper, bankers' acceptances, repurchase agreements and the State of Oregon Treasurer's Local Government Investment Pool (LGIP). Additionally, Oregon Revised Statutes require that deposits be made with approved depository banks. Local Government Investment Pool balances are backed by the full faith and credit of the State of Oregon.

The City maintains a cash and investment pool for all of the City's funds. Monies within the cash and investment pool are identified by fund and by type. Interest earned on the cash and investment pool is allocated to the individual funds based on the individual fund's average cash balance for the period in which the interest was earned. For the *Statement of Cash Flow* purposes, the City considers "cash" to include the pooled cash and investments. The cash and investment pool possess the general characteristics of a demand deposit account since the cash and investment pool has sufficient liquidity in that any fund may deposit or withdraw cash at any time without notice or penalty.

Inventory

The City accounts for inventories using the purchases method, the basis used to value inventories is the cost basis, and the method used to apply that basis is first-in first-out at lower of cost or market.

1. Summary of Significant Accounting Policies (continued)

Receivables

Real and personal property taxes receivable that are collected within 60 days after year-end are considered measurable and available, and therefore, are recognized as revenue. The remaining balance is recorded as unavailable or unearned revenue because it is not deemed available to finance the operations of the current period. Property taxes are levied and become a lien on the property as of July 1. Taxes are payable in three installments on November 15, February 15 and May 15. Taxes unpaid as of May 16 are considered delinquent. All property taxes are billed and collected by Crook County, Oregon and then turned over to the City.

Grant proceeds are recorded as revenue in the period in which qualified program expenditures are incurred. Franchise fees and transient room taxes are recorded as revenue in the period in which they are earned, provided they are remitted to the City within 60 days after year-end.

All governmental type accounts receivable, property taxes, grants, notes, assessments and other receivables are shown net of an allowance for uncollectible accounts, and as of June 30, 2024, no uncollectible amounts are anticipated or have been recognized by management.

Prepaid Expenses

In both government-wide and fund financial statements, certain payments to vendors reflect costs applicable to future City accounting periods and are recorded as prepaid expenses. The cost of prepaid items is recorded as expenditures/expenses when consumed rather than when purchased.

Capital Assets

Purchased or constructed capital assets for governmental activities are recorded at estimated historical cost prior to fiscal year 2007 with subsequent additions at cost. Business-type capital assets are recorded at cost. Donated capital assets, donated works of art and similar items, and capital assets received in a service concession arrangement are recorded at their acquisition value. Infrastructure (bridges, roads, water and sewer improvements, and drainage systems) acquired during the year have been recorded at cost or fair value if contributed by developers. The City defines capital assets as assets with an initial cost of more than $10,000 and an estimated life of more than one year. The cost of normal maintenance and repairs that do not add to the value of the asset or materially extend assets' lives are not capitalized.

Capital assets of the City are depreciated using the straight-line method over the following estimated useful lives:

	Years
Buildings and structures	25-50
Improvements other than buildings	10-20
Machinery and equipment	5-30
Vehicles	5-10
Infrastructure	30-40

1. Summary of Significant Accounting Policies (continued)

Subscription Assets

Subscription assets are assets in which the government obtains control of the right to use the underlying IT asset. The value of the subscription asset is initially measured as the sum of the initial subscription liability amount, any payments made to the IT software vendor before commencement of the subscription term, and any capitalizable implementation costs, less any incentives received from the SBITA vendor at or before the commencement of the subscription term. The subscription asset is amortized in a straight-line manner over the course of the subscription term.

Subscription Liabilities

In the government-wide financial statements, subscription liabilities are reported as liabilities in the Statement of Net Position. In the governmental fund financial statements, the present value of subscription payments expected to be made during the subscription term is reported as other financing sources. The subscription liability is initially measured at the present value of subscription payments expected to be made during the subscription term. Future subscription payments are discounted using the interest rate the SBITA vendor charges the government, which may be implicit, or the government's incremental borrowing rate if the interest rate is not readily determinable. Amortization of the discount on the subscription liability is recognized as an outflow of resources (for example, interest expense) in subsequent financial reporting periods.

Accrued Compensated Absences

It is the City's policy to permit employees to accumulate earned but unused vacation and sick leave within limits set by collective bargaining agreements, personnel policies and employment agreements. All employees with accrued paid leave are paid the outstanding accrued vacation balance at separation of employment. Employees with sick leave accruals that meet longevity requirements are paid, within limits, for their sick leave accruals. All vacation and sick pay is accrued when incurred in the government-wide and proprietary statements. Compensated absences are paid by the individual funds when they become due. The general fund, emergency dispatch fund, transportation fund and the community development fund are governmental funds that have primarily incurred and paid compensated absences in prior years.

Lease Assets and Lease Liabilities

Lease assets are assets which the District leases for a term of more than one year. The value of the leases is determined by the net present value of the leases at the government's incremental borrowing rate at the time of the lease agreement, amortized over the term of the agreement

In the government-wide financial statements, leases payable are reported as liabilities in the Statement of Net Position. In the governmental fund financial statements, the present value of lease payments is reported as other financing sources.

1. Summary of Significant Accounting Policies (continued)

Long-term Debt

In the government-wide financial statements, long-term debt is reported as a liability in the applicable governmental activities, business-type activities, or proprietary fund-type *Statement of Net Position*. Prepaid assets, and deferred amounts on refunding, if significant, are deferred and amortized over the life of the bond using straight-line amortization. Bond premiums and discounts are amortized using the straight-line method. In the fund financial statements, governmental fund-types recognize bond premiums, as well as bond issuance costs during the current period. The face amount of debt issued is reported as other financing sources. Premiums received on debt issuances are reported as other financing sources while discounts on debt issuances are reported as other financing uses. Issuance costs, whether or not withheld from the actual debt proceeds received, are reported as debt service expenditures.

Deferred Outflows/Inflows of Resources

In addition to assets, the *Statement of Net Position* will sometimes report a separate section for deferred outflows of resources. This separate financial statement element, deferred outflows of resources, represents a consumption of net assets that applies to a future period(s), and so will not be recognized as an outflow of resources (expense/expenditure) until then.

In addition to liabilities, the Statement of Financial Position will sometimes report a separate section for deferred inflows of resources. This separate financial statement element represents an acquisition of net assets that applies to a future period(s) and so will not be recognized as an inflow of resources (revenue) until that time.

Fund Equity
The City implemented GASB Statement No. 54 for the year ended June 30, 2011. GASB Statement No. 54 requires analysis and presentation of fund balance in five categories. The new fund balance categories are:

- *Non-spendable* – Includes items that are not in a spendable form because they are either legally or contractually required to be maintained intact.
- *Restricted* – Includes items that are restricted by external creditors, grantors or contributors, or restricted by legal constitutional provisions.
- *Committed* – Includes items that have committed funding for specific purposes or uses by the governing board.
- *Assigned* – Includes items assigned by specific uses, authorized by the city manager and or finance director.
- *Unassigned* – This is the residual classification used for those balances not assigned to another category in the general fund. Deficit fund balances in other governmental funds are also presented as unassigned.

GASB Statement No. 54 implementation requires the highest legal authority to approve authorized commitments of fund balance and to approve who can authorize making assignments of fund balance. The City Council makes commitments through Resolutions. The city manager is authorized to make assignments of fund balance per City Resolution Number 1247.

GASB Statement No. 54 also requires a spending policy, as it relates to ending fund balance. The spending policy states in what order fund balance categories are spent. The spending policy provides that restricted balances are spent first, followed by committed, then unassigned.

1. Summary of Significant Accounting Policies (continued)

Pension Plan

Substantially all of the City's employees, except for Railroad Fund employees, are participants in the State of Oregon Public Employees Retirement System (PERS). For the purpose of measuring the net pension liability, deferred outflows of resources and deferred inflows of resources related to pensions, and pension expense, information about fiduciary net position of PERS and additions to/deductions from PERS's fiduciary net position have been determined on the same basis as they are reported by PERS. For this purpose, benefit payments (including refunds of employee contributions) are recognized when due and payable in accordance with the benefit terms. Investments are reported at fair value. GASB Statements 68 and 71 have been implemented as of July 1, 2014.

Interfund Transfers

Transfers between funds provide support for various City programs in accordance with budgetary authorizations. They are utilized to cover administrative services, provide for additional funding for reserve purposes, contribute towards the cost of capital projects, and to provide for other operational resources.

Budget

The City adopts a biennial budget in accordance with Oregon Revised Statutes (ORS) 294.305 through 294.565. The adopted budget is on a modified accrual basis for all funds. Minor reclassifications are made between the budgetary and the GAAP statements. The Oregon Constitution and ORS require that the budget must be balanced and that the fiscal year for local governments is from July 1 through June 30. The Prineville Budget Committee, consisting of seven citizen representatives, the six city councilors and mayor, is required by ORS as part of the budget process. Through a process of public hearings and deliberations, the Budget Committee reviews, and then recommends a budget to City Council for approval. The budget sets forth City Council's goals and objectives, and identifies the resources necessary to accomplish the goals and objectives. The City's budget is legally adopted by City Council resolution before July 1.

The City maintains budgetary controls to ensure compliance with legal provisions of the City's annual appropriations resolution adopted by the City Council as part of the budget process. The legal level of budgetary control, by City Council resolution, is by department within the general fund and administrative services internal service fund, by program within the golf and restaurant fund and the public works support services internal service fund and by major function, i.e., personal services, material and services, capital outlay, transfers, debt service and other requirements in the remaining funds. The City cannot legally exceed appropriations at these respective levels. Departments may transfer appropriations within a department. All such transfers are reviewed by finance department staff for appropriateness with approval by the city manager as appropriate.

Appropriations lapse at fiscal year-end; projects not completed in the current fiscal year must be re-appropriated in the next fiscal year as part of the adoption of the annual budget.

City Council may change the budget throughout the fiscal year by transferring appropriations between levels of legal compliance. Unexpected additional resources may be budgeted by adopting supplemental budgets as authorized by ORS. A supplemental budget requires newspaper publications, and City Council approval at a minimum, and may require public comments or hearings over a certain dollar threshold. The City Council also approved one resolution adjusting appropriations during the year.

All expenditures were within authorized appropriations.

1. Summary of Significant Accounting Policies (continued)

Net Position Flow Assumptions

The City may fund outlays for a particular purpose from both restricted and unrestricted resources. In order to calculate the amounts to report as restricted net position and unrestricted net position in the government-wide and proprietary fund financial statements, a flow assumption must be made about the order in which resources are considered to have been applied. It is the City's policy to deplete restricted net position first, then committed, then assigned, and lastly unrestricted.

Fund Balance Flow Assumptions

The City may fund outlays for a particular purpose from both restricted and unrestricted resources. In order to calculate the amounts to report as restricted, committed, assigned and unassigned fund balance in the governmental fund financial statements a flow assumption must be made about the order in which resources are considered to have been applied. When both restricted and unrestricted resources are available for use, it is the City's policy to use restricted resources first, then unrestricted resources as needed. When components of restricted fund balance can be used for the same purpose, committed fund balance is depleted second, followed by assigned fund balance. Unassigned fund balance is applied last.

Reserve Policies

The City shall maintain adequate working capital reserves in all funds.

The General Fund shall maintain sufficient working capital to allow the City to adequately fund operations until property taxes are received in November of each year without borrowing. The General Fund shall maintain six (6) months working capital to allow the City to adequately fund operations until property taxes are received in November of each year without borrowing, and shall maintain a goal of twenty (20) percent reserve of its revenue budget. It is the intent of the City to limit the use of the General Fund reserves to non-recurring needs, to ensure the City has the flexibility to respond and mitigate short-term economic downturns, short-term volatility in revenues, and unforeseen emergency situations or circumstances, fund other capital needs or other such non-recurring needs. Additionally, the City will maintain a debt service reserve equal to the annual debt service payment for all debt paid by the general fund.

The City's business-like funds, excluding the rail road, shall maintain a minimum working capital balance sufficient for sixty (60) days of operating expenses, together with a five (5) percent of budgeted revenue for an emergency repair reserve. Additionally, the City will seek to stabilize utility rates by setting aside funds (capital projects reserve), as funding is available from existing resources, for scheduled capital maintenance programs to reduce future borrowing. Where resources from rates and other sources are insufficient to fund scheduled capital projects, long-term debt may be utilized. Evaluation of future debt service requirements will be incorporated into the financial analysis noted above, including funding and maintaining debt service reserves equal to the annual debt service payment for all debt within the funds.

The City's Transportation fund shall maintain at a minimum working capital balance sufficient for sixty (60) days of operating expenses, together with an emergency reserve of five percent (5.0%) of current year revenue. Additionally, the City will set aside funds (capital projects reserve), as funding is available from existing resources, for scheduled capital maintenance programs, and one time capital improvements that are identified in the master plan. The City commits to evaluate annually and utilize electrical franchise fees collected to fund additional capital contributions as needed for projects, and to retain and maintain the pavement condition index (PCI) at the level approved by the City Council.

1. Summary of Significant Accounting Policies (continued)

The City's internal service funds shall maintain, at minimum, a working capital balance of fifteen (15) percent of operating expenses and the city will commit funds and maintain a debt service reserve equal to the annual debt service payment for all debt within the funds.

The City's debt service funds shall maintain adequate working capital to pay required debt service without borrowing and fund debt service reserves in an amount equal to the annual debt service payment.

Due to the variability in revenues resulting from business cycles for the City's rail road operation, the City's rail road fund shall maintain one year's operating expense and twenty (20) percent of total budget for capital reserve. The City will strive to maintain combined total reserves of not less than $1 million with a target of $2 million, increased annually by the percent change in the CPI.

The City's other operating funds shall maintain a minimum working capital balance sufficient for 45 days of operating expenses, for non-recurring capital projects the City will review annually the five year CIP, estimate the impact to the budgets and target an appropriate reserve amount to fund the projects or maintain a debt service payment should the project be too large to fund with current resources, and the City will commit funds and maintain a debt service reserve equal to the annual debt service payment for all debt within the funds.

The policies establish the amounts the City will strive to maintain. They set forth the guidelines for both current activities and long-range planning. The policies are reviewed annually to assure the highest standards of fiscal management. The City may use the unassigned fund balances on a one-time or temporary basis for purposes described above, committed funds may be spent with approval of the city council on a one time basis. The City will develop a plan to restore unassigned and committed reserves to the desired levels.

Fair Value Inputs and Methodologies and Hierarchy

Fair value is defined as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. Observable inputs are developed based on market data obtained from sources independent of the reporting entity. Unobservable inputs are developed based on the best information available about the assumptions market participants would use in pricing the asset. The classification of securities within the fair value hierarchy is based up on the activity level in the market for the security type and the inputs used to determine their fair value, as follows:

Level 1 – unadjusted price quotations in active markets/exchanges for identical assets or liabilities that each Fund has the ability to access

Level 2 – other observable inputs (including, but not limited to, quoted prices for similar assets or liabilities in markets that are active, quoted prices for identical or similar assets or liabilities in markets that are not active, inputs other than quoted prices that are observable for the assets or liabilities (such as interest rates, yield curves, volatilities, loss severities, credit risks and default rates) or other market–corroborated inputs)

Level 3 – unobservable inputs based on the best information available in the circumstances, to the extent observable inputs are not available (including each Fund's own assumptions used in determining the fair value of investments)

The hierarchy gives the highest priority to unadjusted quoted prices in active markets for identical assets or liabilities (Level 1 measurements) and the lowest priority to unobservable inputs (Level 3 measurements).

1. Summary of Significant Accounting Policies (continued)

Accordingly, the degree of judgment exercised in determining fair value is greatest for instruments categorized in Level 3. The inputs used to measure fair value may fall into different levels of the fair value hierarchy. In such cases, for disclosure purposes, the fair value hierarchy classification is determined based on the lowest level input that is significant to the fair value measurement in its entirety.

2. Cash and Investments

The City maintains a pooled cash and investment account for all City funds. The types of investments in which the City may invest are restricted by State of Oregon statutes and a council-adopted investment policy. Authorized investments include U.S. Treasury obligations including treasury notes, bond and strips; federal instrumentality securities from specific federal agencies; commercial paper rated at least A-1 or an equivalent rating; corporate bonds rated at least Aa or an equivalent rating; bankers acceptances rated at least Aa or an equivalent rating; the Oregon State Treasurer's LGIP limited by state statute; certificates of deposits; repurchase agreements and obligations of the states of Oregon, California, Idaho and Washington rated AA or better.

At June 30, 2024, the City's cash and investments were comprised of the following:

Cash on hand	$	3,000
Demand checking accounts		9,374,964
Local government investment pool		19,053,054
	$	28,431,018

	Governmental Activities	Business-type Activities	Total
Cash and investments	$ 24,758,353	3,370,105	28,128,458
Restricted cash and investments	-	302,560	302,560
Total cash and investments	24,758,353	3,672,665	28,431,018

Deposits with Financial Institutions

Deposits with financial institutions are comprised of demand checking accounts. Effective July 1, 2008, the State of Oregon formed the Oregon Public Funds Collateralization Program under ORS 295. The collateralization program creates a state-wide pool of qualified bank depositories for local governments, providing collateralization for bank balances that exceed the limits of Federal Depository Insurance Corporation (FDIC), and eliminating the need for certificates of participation. As of June 30, 2024, the City had a total bank balance of $9,755,238 of which $250,000 was covered by FDIC and the NCUA, with the remaining amount collateralized by the Oregon Public Collateralization Program.

Custodial Credit Risk

Custodial credit risk is the risk that deposits with a financial institution may not be returned to the City. The City's policy, in compliance with state statutes, requires that bank deposits be covered by FDIC and deposited in a financial institution that is qualified in the Oregon Public Funds Collateralization Program. Additionally, deposits in the LGIP are administered by the Oregon State Treasury with the advice of other state agencies and is not rated or registered with the U.S. Securities and Exchange Commission.

2. Cash and Investments (continued)

The LGIP is an open-ended, no-load diversified portfolio offered to any agency, political subdivision, or public corporation of the state that by law is made the custodian of, or has control of any public funds. The LGIP is commingled with the State of Oregon's short-term funds. In seeking to best serve local governments of Oregon, the Oregon Legislature established the Oregon Short-term Fund Board. The purpose of the Board is to advise the Oregon State Treasury in the management and investment of the LGIP.

The board established portfolio diversification percentages based on the types and maturities of investments. LGIP must manage and invest its funds as a prudent investor would, exercising reasonable care, skill and caution. Professional standards indicate that the investments in external investment pools are not subject to custodial risk because they are not evidenced by securities that exist in physical or book entry form. Nevertheless, management does not believe that there is any substantial custodial risk related to investments in the LGIP. A copy of the State's Annual Comprehensive Financial Report may be obtained at http://www.ost.state.or.us/.

Investments

Investments in the Local Government Investment Pool (LGIP) are included in the Oregon Short-Term Fund, which is an external investment pool that is not a 2a-7-like external investment pool, and is not registered with the U.S. Securities and Exchange Commission as an investment company. Fair value of the LGIP is calculated at the same value as the number of pool shares owned. The unit of account is each share held, and the value of the position would be the fair value of the pool's share price multiplied by the number of shares held. Investments in the Short-Term Fund are governed by ORS 294.135, Oregon Investment Council, and portfolio guidelines issued by the Oregon Short-Term Fund Board, which establish diversification percentages and specify the types and maturities of investments. The portfolio guidelines permit securities lending transactions as well as investments in repurchase agreements and reverse repurchase agreements. The fund appears to be in compliance with all portfolio guidelines at June 30, 2024. The LGIP seeks to exchange shares at $1.00 per share; an investment in the LGIP is neither insured nor guaranteed by the FDIC or any other government agency. Although the LGIP seeks to maintain the value of share investments at $1.00 per share, it is possible to lose money by investing in the pool. We intend to measure these investments at book value since it materially approximates fair value. The pool is comprised of a variety of investments. These investments are characterized as a level 2 fair value measurement in the Oregon Short Term Fund's audited financial report. As of June 30, 2024, the fair value of the position in the LGIP is 100 percent of the value of the pool shares as reported in the Oregon Short Term Fund audited financial statements. Amounts in the State Treasurer's Local Government Investment Pool are not required to be collateralized.

Interest Rate Risk

The City's investment policy limits its investment maturities as a means of managing its exposure to fair value losses arising from increasing interest rates. At June 30, 2024, the City did not hold any individual investments. As such, its interest rate risk is limited to adjustments in its money market accounts, including the LGIP.

Credit Risk

As mentioned above, Oregon Revised Statutes limits the investments that the City may have to high quality bonds with limited exposure to credit risk. The City is in compliance with these statutes at June 30, 2024.

3. Receivables

Accounts Receivable

The City maintains security deposits for utility accounts and writes off uncollectible accounts as they occur. Past write-off experience is insignificant to the balance of accounts receivable therefore no allowance for doubtful accounts has been recorded.

As of June 30, 2024, accounts receivable consisted of the following:

Accounts receivable-governmental activities	$	2,052,224
Accounts receivable- business type		3,524,772
Total	$	5,576,996

Amounts Due from Other Funds

An amount due to the general fund from the railroad fund in the amount of $771,851 is recorded. The amount due is the result of transfers from the general fund to the freight depot fund through June 30, 2024 to pay debt service related to industrial park development, with the intent for the transfers to be repaid at a future date. However, repayment terms have not been established pending the railroad demonstrating the ability to generate sufficient positive cash flow to discontinue the transfers and repay the debt on a recurring basis. Accordingly, unearned revenue of $771,851 has been recorded in the general fund.

4. Capital Assets

Purchased or constructed capital assets acquired prior to June 30, 2007 are recorded at estimated historical cost with subsequent additions at cost. Donated capital assets, donated works of art and similar items, and capital assets received in a service concession arrangement are recorded at their acquisition value at the time of donation or contribution. Infrastructure (roads, water, wastewater, sidewalks and other similar improvements) acquired during the year are recorded at cost or fair value if contributed by developers. The City defines capital assets as assets with an initial cost of more than $10,000 and an estimated useful life of more than one year. The cost of normal maintenance and repairs that do not add value of the asset or materially extend the assets' useful lives are not capitalized.

Capital assets of the City are depreciated using the straight-line method over the following estimated useful lives:

	Years
Buildings and structures	25-50
Improvements other than buildings	10-20
Machinery and equipment	5-30
Vehicles	5-10
Infrastructure	30-40

4. Capital Assets (continued)

Governmental activities: Capital asset activity for governmental activities for the year ended June 30, 2024, was as follows:

	Balance June 30, 2023	Additions	Deletions	Balance June 30, 2024
Governmental activities:				
Capital assets not being depreciated:				
Land and Easements	$ 2,739,442	$ -	$ -	$ 2,739,442

				-
Total accumulated depreciation	35,020,759	2,996,859	(12,653)	38,004,965
Total Capital Assets Net of Depreciation	$ 82,668,713			$ 87,991,275

5. Debt

In the following schedules, long-term obligations information is presented separately with respect to governmental and business-type activities, including individual fund information for business-type activity. The schedules present current year changes in these obligations and the current portions, amount due within one year, for each issue. For the governmental activities, compensated absences are liquidated by the fund that pays for the employee costs associated with the services received. Compensated absences are due and payable on demand upon an employee's retirement or other separation from employment. There are two known employee retirements or separations as of June 30, 2024. The amount due to these employees including benefits, as of June 30, 2024, is presented as a current liability, with the balance of the compensated obligation shown as a non-current liability.

5. Debt (continued)

Governmental Activities

A United States Department of Agriculture (USDA) debt obligation was utilized to finance the construction of city hall in 2006. This debt was refinanced in 2018 and then again in 2022. The annual debt service requirement is $105,844 including interest of 1.22 percent annually. The City reserved an amount of $105,000 for future requirements on this debt. The note contains a provision stating that in the event of default the Lender may exercise any amount available at law or in equity. However, amounts due from the City are not subject to acceleration.

A $2.55 million note payable entered into in 2018 was utilized to fund the City's actuarial unfunded pension liability. This was a refunding of a 2014 note payable. Annual debt service in fiscal year 2019 was $275,961 increasing by an average of 3.7 percent annually, consistent with the projected annual increase in payroll obligations. The obligation matures in 10 years, fiscal year 2028, and includes taxable interest of 3.70 percent annually. The note does not have significant default provisions.

A $184,940 note payable entered into in 2022 was utilized to purchase a street sweeper. The annual debt service requirement is $40,198, including interest of 2.84 percent annually. The note contains a provision stating that in the event of default the Lender may exercise any amount available at law or in equity, it may declare all or part of the indebtedness immediately due and payable, and may require all equipment to be returned.

The city financed the purchase of Tasers for the Police Department. The annual debt service requirement is $10,963, including 3.3% interest annually. In the event of default, the City will be invoiced for the remaining balance of the MSRP of the devices.

5. Debt (continued)

A $5.96 million note payable entered into in 2020 was utilized to complete the police building project and refinance an existing loan balance of $3.74 million, which was utilized for the first part of the construction of a new police building. The annual debt service requirement varies from $369,343 to $558,498, including interest of 1.73 percent annually. The note contains a provision stating that in the event of default the Lender may increase the interest rate by 3.00 percent and exercise any amount available at law or in equity. However, amounts due from the City are not subject to acceleration.

Future maturities of governmental long-term debt at June 30, 2024, are as follows:

Direct Borrowings:

	Pension Bonds		Street Sweeper	
Year	Principal	Interest	Principal	Interest
2025	$ 299,825	$ 43,421	$ 36,959	$ 3,239
2026	326,592	32,322	38,009	2,190
2027	352,868	20,232	39,088	1,110
2028	193,634	7,170	-	-
Total	$ 1,172,919	$ 103,145	$ 114,056	$ 6,539

	Police Building		FFCO 2022 - City Hall		Police Tasers	
Year	Principal	Interest	Principal	Interest	Principal	Interest
2025	$ 333,000	$ 82,815	$ 95,854	$ 8,460	$ 9,628	$ 1,335
2026	351,000	77,054	97,531	7,300	9,946	1,018
2027	370,000	70,982	99,148	6,120	10,274	689

2029	410,000	57,834	101,214	3,714	-	-
2030-2034	2,384,000	175,250	205,709	3,736	-	-
2035	549,000	9,498	-	-	-	-
Total	$ 4,787,000	$ 538,014	$ 699,161	$ 34,250	$ 40,462	$ 3,391

Business-type Activities

In addition to the schedule on the previous page, debt for each of the business-type activities for the year ended June 30, 2024, by the business activity responsible for the repayment of the debt obligation, are presented below. The City issued $7.473 million in full faith and credit obligations to refinance four outstanding obligations totaling $7.326 million ($5.17 million wastewater related, $2.06 million of water related debt, and $264 thousand golf related debt). The full faith and credit obligations mature in fiscal year 2031 for water and wastewater, and 2026 for golf, and have effective interest rates of 1.22 percent. Sources of repayment include water utility, wastewater utility, and golf revenues. The obligations have a provision stating that at event of default, the Lender may increase the interest rate applicable to the outstanding balance by 3 percent and exercise any remedy available at law or equity. Amounts due are not subject to acceleration.

Wastewater. The wastewater utility has financed the City's sewer treatment plant, golf course treatment facility, and collection system improvements through several debt obligations. These obligations are described as follows:

5. Debt (continued)

A previously refunded issue was refunded again in 2018 with proceeds of the full faith and credit obligation noted above. Full faith and credit obligation series 2011 was refunded. A CWSRL obligation requires annual debt service payments of $587,230, including interest of 3 percent (2.94 percent). The obligation contains a provision stating that in the event of default, Oregon DEQ (lender) may declare the outstanding loan amount plus any accrued interest fees and other amounts immediately due and payable, cease making disbursement of loan proceeds, operate the facility that produces pledged revenues and collect the gross revenues, set and collect utility rates and charges, pay or settle any liens, or direct the State treasurer to withhold any amounts otherwise due to the Borrower from the State of Oregon.

In 2019, the City finalized a finance agreement with USDA. The total amount received was $4,000,000 at an interest rate of 2.75 percent. The loan becomes due in 2058 and the annual debt service is $166,660. The debt service reserve requirement is fully funded in the amount of $166,660. The City also keeps a short-lived asset replacement reserve account as restricted funds in the amount of $191,595. USDA, at its option, may declare all or part of the indebtedness immediately due and payable.

In 2016, the City finalized a finance agreement with Oregon Infrastructure Authority. The City finished drawing down on the loan in 2019 for a total amount of $750,000 at an interest rate of 1 percent. The loan becomes due in 2042 and the annual debt service is $34,056. The note contains a provision stating that in the event of default, Oregon Infrastructure Authority, at its option, may declare all or part of the indebtedness immediately due and payable.

The summary of wastewater outstanding obligations and their future maturities including principal and interest at June 30, 2024, are as follows:

Wastewater	Balance June 30, 2023	New Issues	Principal Paid	Balance June 30, 2024
Revenue Bond:				
USDA 2018	$ 3,703,326	$ -	$ 64,319	$ 3,639,007

2029-33	150,744	19,531	548,749	10,048
2034-38	158,432	11,843	-	-
2039-43	141,160	3,675	-	-
Total	$ 593,763	$ 61,897	$ 3,047,410	$ 116,135

Water. The City entered into a loan agreement with Oregon Infrastructure Finance Authority of the Business Development Department (OBDD) to fund Aquifer Storage and Recovery. The total amount to be received is $3,024,900 at an interest rate of 1.30 percent. At June 30, 2024 the City has drawn down $3,000,000. No amortization schedule has been set yet and all of the balance is classified as due in more than one year. The OBDD loan contains a provision that all amounts outstanding become immediately due in the event of default.

A summary of outstanding debt payable from water system revenues including future maturities of water-related debt principal and interest, at June 30, 2024, are as follows:

Water	Balance June 30, 2023	New Issues	Principal Paid	Balance June 30, 2024
Full Faith and Credit Obligations 2022	$ 1,588,956	$ -	$ 159,040	$ 1,429,916
Total Debt	$ 1,588,956	$ -	$ 159,040	$ 1,429,916

Direct Borrowing:

Year	Full Faith 2022 Principal	Full Faith 2022 Interest
2025	$ 163,383	$ 17,302
2026	163,453	15,325
2027	200,381	13,347
2028	209,942	10,923
2029	222,517	8,382
2028-2032	470,240	8,612
Total	$ 1,429,916	$ 73,891

Golf. As described above, the City refinanced the outstanding note payable in 2017 and again in 2023. The term on the new note payable is five years maturing in 2026 with interest of 1.22 percent. The Golf Course's debt obligations, including future maturities of principal and interest at June 30, 2024, are as follows:

5. Debt (continued)

Golf	Balance June 30, 2023	New Issues	Principal Paid	Balance June 30, 2024
Direct Borrowings:				
Full Faith and Credit Obligations Refunding 2022	$ 369,555	$ -	$ 123,493	$ 246,062
Total Golf	$ 369,555	$ -	$ 123,493	$ 246,062

Direct Borrowing

	FFC Refunding 2022	
Year	Principal	Interest
2025	$ 123,518	$ 2,977
2026	122,544	1,483
Total	$ 246,062	$ 4,460

6. Interfund Transfers

Interfund transfers between governmental and business-type activities are reported as net transfers in the *Statement of Activities*. Details of the transfers between governmental and business-type activities are as follows:

Fund	Transfers In	Transfers Out
General Fund	$ 441,767	$ 3,830,860
Transportation Fund	824,300	235,800
Emergency Dispatch Fund	400,000	519,900
Transportation SDC Fund	-	33,718
Pension Debt Service Fund	50,000	-
Water	172,100	2,359,858
Wastewater	165,239	1,909,595
Railroad	370,000	165,800
Golf	-	99,100
Airport Fund	30,360	32,000
Internal Service Funds	7,033,453	300,588
Total	$ 9,487,219	$ 9,487,219

Transfers from the general fund to the emergency dispatch fund reflect the City's share of the contracted service, to transportation fund for capital improvements, to the airport fund for the operational funding agreement between the City and Crook County, and to the other governmental funds transfers reflect contributions to fund community development operations and pay for internal services such as administration, finance, information technology, and building facilities. Transfers from other funds to internal service funds reflect the internal cost allocation of internal services such as administration, finance, information technology, facilities, pension liabilities, and public works personnel and support services. The transfer from the wastewater fund to golf and restaurant fund is for payment for treatment services, and the transfers to water and wastewater are transfers from SDC funds for qualified infrastructure improvements paid for by utility funds.

7. Defined Benefit Pension Plan

Plan Description – The Oregon Public Employees Retirement System (PERS) consists of a single cost-sharing multiple-employer defined benefit plan. All benefits of the system are established by the legislature pursuant to Oregon Revised Statute (ORS) Chapters 248 and 248A. Oregon PERS produces an independently audited Annual Comprehensive Financial Report which can be found at:
https://www.oregon.gov/pers/Documents/Financials/CAFR/2023-Annual-Comprehensive-Financial-Report.pdf
If the link is expired please contact Oregon PERS for this information.

a. **PERS Pension (Chapter 248)**. The ORS Chapter 248 Defined Benefit Plan is closed to new members hired on or after August 29, 2003.
   i. **Pension Benefits**. The PERS retirement allowance is payable monthly for life. It may be selected from 13 retirement benefit options. These options include survivorship benefits and lump-sum refunds. The basic benefit is based on years of service and final average salary. A percentage (2.0 percent for police and fire employees, and 1.67 percent for general service employees) is multiplied by the number of years of service and the final average salary. Benefits may also be calculated under either a formula plus annuity (for members who were contributing before August 22, 1981) or a money match computation if a greater benefits results.
   A member is considered vested and will be eligible at minimum retirement age for a service retirement allowance if he or she has had a contribution in each of five calendar years or has reached at least 50 years of age before ceasing employment with a participating employer (age 45 for police and fire members). General service employees may retire after reaching age 55. Police and fire members are eligible after reaching age 50. Tier 1 general service employee benefits are reduced if retirement occurs prior to age 58 with fewer than 30 years of service. Police and fire member benefits are reduced if retirement occurs prior to age 55 with fewer than 25 years of service. Tier 2 members are eligible for full benefits at age 60. The ORS Chapter 248 Defined Benefit Pension Plan is closed to new members hired on or after August 29, 2003.
   ii. **Death Benefits**. Upon the death of a non-retired member, the beneficiary receives a lump-sum refund of the member's account balance (accumulated contributions and interest). In addition, the beneficiary will receive a lump-sum payment from employer funds equal to the account balance, provided one or more of the following contributions are met:
      - member was employed by PERS employer at the time of death,
      - member died within 120 days after termination of PERS covered employment,
      - member died as a result of injury sustained while employed in a PERS-covered job, or
      - member was on an official leave of absence from a PERS-covered job at the time of death.
   iii. **Disability Benefits**. A member with 10 or more years of creditable service who becomes disabled from other than duty-connected causes may receive a non-duty disability benefit. A disability resulting from a job-incurred injury or illness qualifies a member (including PERS judge members) for disability benefits regardless of the length of PERS-covered service. Upon qualifying for either a non-duty or duty disability, service time is computed to age 58 (55 for police and fire members) when determining the monthly benefit.
   iv. **Benefit Changes After Retirement**. Members may choose to continue participation in their variable account after retiring and may experience annual benefit fluctuations due to changes in the fair value of the underlying global equity investments of that account. Under ORS 248.360 monthly benefits are adjusted annually through cost-of-living changes (COLA). The COLA is capped at 2.0 percent.

b. **OPSRP Pension Program (OPSRP DB)**. The ORS Chapter 248A Defined Benefit Pension Program provides benefits to members hired on or after August 29, 2003.

7. Defined Benefit Pension Plan (continued)

i. **Pension Benefits**. This portion of OPSRP provides a life pension funded by employer contributions. Benefits are calculated with the following formula for members who attain normal retirement age:
Police and fire: 1.8 percent is multiplied by the number of years of service and the final average salary. Normal retirement age for police and fire members is age 60 or age 53 with 25 years of retirement credit. To be classified as a police and fire member, the individual must have been employed continuously as a police and fire member for at least five years immediately preceding retirement.
General service: 1.5 percent is multiplied by the number of years of service and the final average salary. Normal retirement age for general service members is age 65, or age 58 with 30 years of retirement credit.
A member of the pension program becomes vested on the earliest of the following dates: the date the member completes 600 hours of service in each of five calendar years, the date the member reaches normal retirement age, and, if the pension program is terminated, the date on which termination becomes effective.

ii. **Death Benefits**. Upon the death of a non-retired member, the spouse or other person who is constitutionally required to be treated in the same manner as the spouse, receives for life 50 percent of the pension that would otherwise have been paid to the deceased member. The surviving spouse may elect to delay payment of the death benefit, but payment must commence no later than December 31 of the calendar year in which the member would have reached 70½ years.

iii. **Disability Benefits**. A member who has accrued 10 or more years of retirement credits before the member becomes disabled or a member who becomes disabled due to job-related injury shall receive a disability benefit of 45 percent of the member's salary determined as of the last full month of employment before the disability occurred.

Contributions – PERS funding policy provides for monthly employer contributions at actuarially determined rates. These contributions, expressed as a percentage of covered payroll, are intended to accumulate sufficient assets to pay benefits when due. The funding policy applies to the PERS Defined Benefit Plan and the Other Postemployment Benefit Plans. Employer contribution rates during the period were based on the December 31, 2022 actuarial valuation, which became effective July 1, 2023. The state of Oregon and certain schools, community colleges, and political subdivision have made unfunded actuarial liability payments and their rates have been reduced. Employer contributions for the year ended June 30, 2024 were $1,005,306, excluding amounts to fund employer specific liabilities. In addition, approximately $350,458 in employee contributions were paid or picked up by the City in fiscal 2024. At June 30, 2024, the City reported a net pension liability of $8,416,699 for its proportionate share of the net pension liability. The pension liability was measured as of June 30, 2023, and the total pension liability used to calculate the net pension liability was determined by an actuarial valuation dated December 31, 2021. The City's proportion of the net pension liability was based on a projection of the City's long-term share of contributions to the pension plan relative to the projected contributions of all participating employers, actuarially determined. As of the measurement date of June 30, 2023 and 2022, the City's proportion was .044 percent and .041 percent, respectively. Pension expense for the year ended June 30, 2024 was $752,470.

The rates in effect for the year ended June 30, 2024 were:

(1)Tier 1/Tier 2 – 19.92%
(2)OPSRP general services – 14.62%
(3)OPSRP Police and Fire – 19.41%

7. Defined Benefit Pension Plan (continued)

The amount of contributions subsequent to the measurement date will be included as a reduction of the net pension liability in the fiscal year ended June 30, 2025.

	Deferred Outflow of Resources	Deferred Inflow of Resources
Difference between expected and actual experience	$ 411,602	$ 33,373
Changes in assumptions	747,690	5,575
Net difference between projected and actual earnings on pension plan investments	151,283	-
Net changes in proportionate share	1,342,165	7,708
Differences between City contributions and proportionate share of contributions	36,243	909,489
Subtotal - Amortized Deferrals (below)	2,688,983	956,145
City contributions subsequent to measuring date	1,005,306	-
Deferred outflow (inflow) of resources	$ 3,694,289	$ 956,145

Amounts reported as deferred outflows or inflows of resources related to pension will be recognized in pension expense as follows:

Year ending June 30,	Amount
2025	$ 404,716
2026	(50,908)
2027	959,629
2028	366,083
2029	53,318
Thereafter	-
Total	$ 1,732,838

All assumptions, methods and plan provisions used in these calculations are described in the Oregon PERS system-wide GASB 68 reporting summary dated February 2, 2024. Oregon PERS produces an independently audited ACFR which can be found at:
https://www.oregon.gov/pers/Documents/Financials/CAFR/2023-Annual-Comprehensive-Financial-Report.pdf

Actuarial Valuations – The employer contribution rates effective July 1, 2023 through June 30, 2025, were set using the entry age normal actuarial cost method. For the Tier One/Tier Two component of the PERS Defined Benefit Plan, this method produced an employer contribution rate consisting of (1) an amount for normal cost (estimated amount necessary to finance benefits earned by employees during the current service year), (2) an amount for the amortization unfunded actuarial accrued liabilities, which are being amortized over a fixed period with new unfunded actuarial liabilities being amortized over 20 years.

For the OPSRP Pension Program component of the PERS Defined Benefit Plan, this method produced an employer rate consisting of (a) an amount for normal cost (the estimated amount necessary to finance benefits earned by the employees during the current service year), (b) an actuarially determined amount for funding a disability benefit component, and (c) an amount for the amortization of unfunded actuarial accrued liabilities,

7. Defined Benefit Pension Plan (continued)

which are being amortized over a fixed period with new unfunded actuarial accrued liabilities being amortized over 16 years.

Actuarial Methods and Assumptions:

Valuation date	December 31, 2021
Experience Study Report	2020, Published July 20, 2021
Actuarial cost method	Entry Age Normal
Amortization method	Level percentage of payroll
Asset valuation method	Fair value
Inflation rate	2.40 percent
Investment rate of return	6.90 percent
Discount rate	6.90 percent
Projected salary increase	3.40 percent
Cost of Living Adjustment	Blend of 2% COLA and graded COLA (1.25%/0.15%) in accordance with *Moro* decision; blend based on service
Mortality	Healthy retirees and beneficiaries: Pub-2010 Healthy Retiree, sex distinct, generational with Unisex, Social Security Data Scale, with job category adjustments and set-backs as described in the valuation. Active members: Pub-2010 Employee, sex distinct, generational with Unisex, Social Security Data Scale, with job category adjustments and set-backs as described in the valuation. Disabled retirees: Pub-2010 Disabled Retiree, sex distinct, generational with Unisex, Social Security Data Scale, with job category adjustments and set-backs as described in the valuation.

Actuarial valuations of an ongoing plan involve estimates of value of reported amounts and assumptions about the probability of events far into the future. Actuarially determined amounts are subject to continual revision as actual results are compared to past expectations and new estimates are made about the future. Experience studies are performed as of December 31 of even numbered years. The method and assumptions shown are based on the 2020 Experience Study which is reviewed for the four-year period ending December 31, 2020.

Assumed Asset Allocation:

Asset Class/Strategy	Low Range	High Range	OIC Target
Debt Securities	20.0%	30.0%	25.0%
Public Equity	22.5%	32.5%	27.5%
Real Estate	9.0%	16.5%	12.5%
Private Equity	17.5%	27.5%	20.0%
Real Assets	2.5%	10.0%	7.5%
Diversifying Strategies	2.5%	10.0%	7.5%
Opportunity Portfolio	0.0%	5.0%	0.0%
Total			100.0%

(Source: June 30, 2023 PERS ACFR; p. 125)

7. Defined Benefit Pension Plan (continued)

Long-Term Expected Rate of Return:

To develop an analytical basis for the selection of the long-term expected rate of return assumption, in January 2023 the PERS Board reviewed long-term assumptions developed by both Milliman's capital market assumptions team and the Oregon Investment Council's (OIC) investment advisors. The table below shows Milliman's assumptions for each of the asset classes in which the plan was invested at that time based on the OIC long-term target asset allocation. The OIC's description of each asset class was used to map the target allocation to the asset classes shown below. Each asset class assumption is based on a consistent set of underlying assumptions, and includes adjustment for the inflation assumption. These assumptions are not based on historical returns, but instead are based on a forward-looking capital market economic model.

Asset Class	Target Allocation	Compound Annual (Geometric) Return
Global Equity	27.50%	7.07%
Private Equity	25.50%	8.83%
Core Fixed Income	25.00%	4.50%
Real Estate	12.25%	5.83%
Master Limited Partnerships	0.75%	6.02%
Infrastructure	1.50%	6.51%
Hedge Fund of Funds - Multistrategy	1.25%	6.27%
Hedge Fund Equity - Hedge	0.63%	6.48%
Hedge Fund - Macro	5.62%	4.83%
Assumed Inflation - Mean		*2.35%*

(Source: June 30, 2023 PERS ACFR; p. 92)

Discount Rate – The discount rate used to measure the total pension liability was 6.90 percent for the Defined Benefit Pension Plan. The projection of cash flows used to determine the discount rate assumed that contributions from the plan members and those of the contributing employers are made at the contractually required rates, as actuarially determined. Based on those assumptions, the pension plan's fiduciary net position was projected to be available to make all projected future benefit payments of current plan members. Therefore, the long-term expected rate of return on pension plan investments for the Defined Benefit Pension Plan was applied to all periods of projected benefit payments to determine the total pension liability.

Sensitivity of the City's proportionate share of the net pension liability to changes in the discount rate – the following presents the City's proportionate share of the net pension liability calculated using the discount rate of 6.90 percent, as well as what the City's proportionate share of the net pension liability would be if it were calculated using a discount rate that is one percent lower (5.90 percent) or one percent higher (7.90 percent) than the current rate.

	1% Decrease (5.90%)	Discount Rate (6.90%)	1% Increase (7.90%)
Proportionate share of the net pension liability	$ 13,902,803	$ 8,416,699	$ 3,825,412

7. Defined Benefit Pension Plan (continued)

Changes Subsequent to the Measurement Date

As described above, GASB 67 and GASB 68 require the Total Pension Liability to be determined based on the benefit terms in effect at the Measurement Date. Any changes to benefit terms that occurs after that date are reflected in amounts reported for the subsequent Measurement Date. However, Paragraph 80f of GASB 68 requires employers to briefly describe any changes between the Measurement Date and the employer's reporting date that are expected to have a significant effect on the employer's share of the collective Net Pension Liability, along with an estimate of the resulting change, if available.

There are no changes subsequent to the June 30, 2023 Measurement Date that meet this requirement and thus would require a brief description under the GASB standard.

Deferred Compensation Plan

A deferred compensation plan is available to employees wherein they may execute an individual agreement with the City for amounts earned by them to not be paid until a future date when certain circumstances are met. These circumstances are: termination by reason of resignation, death, disability, or retirement; unforeseeable emergency; or by requesting a de minimis distribution from inactive accounts valued less than $5,000. Payment to the employee will be made over a period not to exceed 15 years. The deferred compensation plan is one which is authorized under IRC Section 457 and has been approved in its specifics by a private ruling from the Internal Revenue Service. The assets of the plan are held by the administrator for the sole benefit of the plan participants and are not considered assets or liabilities of the City.

OPSRP Individual Account Program (OPSRP IAP)

Plan Description:
Employees of the City are provided with pensions through OPERS. All the benefits of OPERS are established by the Oregon legislature pursuant to Oregon Revised Statute (ORS) Chapters 248 and 248A. Chapter 248 Defined Benefit Pension Plan is closed to new members hired on or after August 29, 2003. Chapter 248A created the Oregon Public Service Retirement Plan (OPSRP), which consists of the Defined Benefit Pension Program and the Individual Account Program (IAP). Membership includes public employees hired on or after August 29, 2003. PERS members retain their existing defined benefit plan accounts, but member contributions are deposited into the member's IAP account. OPSRP is part of OPERS, and is administered by the OPERS Board.

Pension Benefits:
Participants in OPERS defined benefit pension plans also participate in their defined contribution plan. An IAP member becomes vested on the date the employee account is established or on the date the rollover account was established. If the employer makes optional employer contributions for a member, the member becomes vested on the earliest of the following dates: the date the member completes 600 hours of service in each of five calendar years, the date the member reaches normal retirement age, the date the IAP is terminated, the date the active member becomes disabled, or the date the active member dies. Upon retirement, a member of the OPSRP IAP may receive the amounts in his or her employee account, rollover account, and vested employer account as a lump-sum payment or in equal installments over a 5-, 10-, 15-, 20-year period or an anticipated life span option. Each distribution option has a $200 minimum distribution limit.

7. Defined Benefit Pension Plan (continued)

Death Benefits:
Upon the death of a non-retired member, the beneficiary receives in a lump sum the member's account balance, rollover account balance, and vested employer optional contribution account balance. If a retired member dies before the installment payments are completed, the beneficiary may receive the remaining installment payments or choose a lump-sum payment.

Contributions:
Employees of the City pay six (6) percent of their covered payroll. Effective July 1, 2020, currently employed Tier 1/Tier 2 and OPSRP members earning $2,500 or more per month (increased to $3,333 per month in 2023) will have a portion of their 6 percent monthly IAP contributions redirected to an Employee Pension Stability Account. The Employee Pension Stability Account will be used to pay part of the member's future benefit. Of the 6 percent monthly IAP contribution, Tier 1/Tier 2 will have 2.5 percent redirected to the Employee Pension Stability Account and OPSRP will have 0.75 percent redirected to the Employee Pension Stability Account, with the remaining going to the member's existing IAP account. Members may voluntarily choose to make additional after-tax contributions into their IAP account to make a full 6 percent contribution to the IAP. The City did not make any optional contributions to member IAP accounts for the year ended June 30, 2024.

Additional disclosures related to Oregon PERS not applicable to specific employers are available online, or by contacting PERS at the following address: PO Box 24700 Tigard, OR 97281-3700.

http://www.oregon.gov/pers/EMP/Pages/GASB.aspx

8. Risk Management

The City is exposed to various risks of loss related to torts; theft of, damage to, and destruction of assets; errors and omissions; injuries to employees and natural disasters. Except for unemployment compensation, the City purchases commercial insurance to minimize its exposure to these risks. There was no change in commercial insurance coverage from fiscal year 2023 to 2024. Workers compensation claims are insured through incurred loss retrospective policies. Settled claims have not exceeded this commercial coverage for any of the past three years. Liabilities are reported when it is probable that a loss has occurred and the amount of the loss can be reasonably estimated.

9. Other Information

Deferred Compensation Plan

The City has a deferred compensation plan created in accordance with the Internal Revenue Code Section 457(g). The plan is administered by independent plan administrators through administrative service agreements. The plan is available to all employees of the City. Employees may defer a portion of their salary until future years. Deferred compensation is not available to employees until termination, retirement, death, or financial hardship. The plan's assets are held in a custodial account for the exclusive benefit of participants and beneficiaries, and are not subject to the claims of the City's creditors, nor can they be used by the City for any purpose other than the payment of benefits to the plan participants. Accordingly, these plan assets and related liability are not recorded in the City's basic financial statements.

10. Fund Balances

Below is a schedule of fund balances as of June 30, 2024, based on GASB Statement No. 54 implementation:

Fund Balances:	General Fund	Emergency Dispatch Fund	Transportation Fund	Transportation SDC Fund	POB Debt Service Fund	Total
Restricted:						
Highways and stree	$ -	$ -	$ 839,637	$ 2,430,096	$ -	$ 3,269,733
	-	-	839,637	2,430,096	-	3,269,733
Committed to:						
Public safety	-	1,902,347	-	-	-	1,902,347
Debt service	-	-	-	-	2,184,240	2,184,240
	-	1,902,347	-	-	2,184,240	4,086,587
Assigned to: Other purposes	248,505	-	-	-	-	248,505
Unassigned:	6,842,202	-	-	-	-	6,842,202
Total	$ 7,090,707	$ 1,902,347	$ 839,637	$ 2,430,096	$ 2,184,240	$ 14,447,027

11. Property Tax Abatements

As of June 30, 2024, the City provides tax abatements through two programs: Long-Term Rural Enterprise Zone Facilities, ORS 285C.400 and Levy Exemption, ORS 307.519.

The Oregon Long-Term Rural Enterprise Zone Facilities program is a State of Oregon economic development program established, that allows for property tax exemptions for up to fifteen years. In exchange for receiving property tax exemption, participating firms are required to meet the program requirements set by state statute and the local sponsor. This program is only available in counties with chronic low income or chronic unemployment.

The Enterprise Zone program allows industrial firms that will be making a substantial new capital investment a waiver of 100 percent of the amount of real property taxes attributable to the new investment for up to a 15-year period after completion. Land or existing machinery or equipment is not tax exempt; therefore, there is no loss of current property tax levies to local taxing jurisdiction.

For the fiscal year ended June 30, 2024, the City abated property taxes totaling $17,999,827 and $2,317 under the Enterprise Zone and Levy Exemption, respectively. The City also had $12,623 in other miscellaneous exemptions.

12. Other Post-Employment Benefits

Post-employment Health Insurance Subsidy

Plan Description

The City administers a single-employer defined benefit healthcare plan that covers both active and retired participants. The plan provides post-retirement healthcare benefits for eligible retirees and their dependents through the City's group health insurance plans. The City's post-retirement plan was established in accordance with Oregon Revised Statutes (ORS) 243.303 which states, in part, that for the purposes of establishing healthcare premiums, the calculated rate must be based on the cost of all plan members, including both active employees and retirees. Because claim costs are generally higher for retiree groups than for active members, the premium amount does not represent the full cost of coverage for retirees. The resulting additional cost, or implicit subsidy, is required to be valued under GASB Statement 75 related to Other Post-Employment Benefits (OPEB). Calculations are based on the OPEB benefits provided under the terms of the substantive plan in effect at the time of each valuation and on the pattern of sharing of costs between the employer and plan members to that point. Actuarial valuations for OPEB plans involve estimates of the value of reported amounts and assumptions about the probability of events far into the future, and actuarially determined amounts are subject to continual revision as results are compared to past expectations and new estimates are made about the future. Actuarial calculations of the OPEB plan reflect a long-term perspective. The valuation date was July 1, 2022 and the measurement date was June 30, 2023.

Funding Policy

The City has not established a trust fund to finance the cost of post-employment health care benefits related to implicit rate subsidies. Premiums are paid by retirees based on the rates established for active employees. Additional costs related to an implicit subsidy are paid by the City on a pay-as-you-go basis. There is no obligation on the part of the City to fund these benefits in advance. The City considered the liability to be solely the responsibility of the City as a whole and it is allocated to the governmental statements.

Actuarial Methods and Assumptions

The City engaged an actuary to perform a valuation as of July 1, 2022 using the Entry Age Normal, level percent of salary Actuarial Cost Method. Mortality rates were based on the Pub-2010 General and Safety Employee Healthy Retiree tables, sex distinct for members and dependents, with a one-year setback for male general service employees and female safety employees. Mortality is projected on a generational basis using Generational Unisex Social Security Data Scale. Demographic assumptions regarding retirement, mortality, and turnover are based on Oregon PERS valuation assumptions as of December 31, 2022. Election rate and lapse assumptions are based on experience implied by valuation data for this and other Oregon public employers.

12. Other Post-Employment Benefits (continued)

Health Care Cost Trend	Medical and vision: Year / Pre-65 Trend 2022 4.25% 2023 6.75% 2024 6.50% 2025 6.00% 2026 5.25% 2027 5.00% 2028-2029 4.75% 2030 4.50% 2031-2065 4.25% 2066-2071 4.00% 2072+ 3.75% Dental: 4.00% per year Health care cost trend affects both the projected health care costs as well as the projected health care
General Inflation	2.40% per year, used to develop other economic assumptions
Annual Pay Increases	3.40% per year, based on general inflation and the likelihood of raises throughout participants' careers
Mortality	Pub-2010 General and Safety Employee and Healthy Retiree tables, sex distinct for members and dependents, with a one-year setback for male general service employees and female safety employees.
Disability	Not used
Withdrawal	Based on Oregon PERS assumptions. Annual rates are based on employment classification, gender, and duration from hire date.
Retirement	Based on Oregon PERS assumptions. Annual rates are based on age, Tier/OPSRP, duration of service, and employment classification.

12. Other Post-Employment Benefits (continued)

Changes in the Net OPEB Liability

	Increase/ (Decrease)
Total OPEB Liability at June 30, 2023	$ 533,287
Changes for the year:	
Service cost	22,797
Interest	18,860
Changes in benefit terms	-
Differences between expected and actual experience	-
Changes of assumptions or other input	(4,409)
Benefit payments	(47,026)
Balance as of June 30, 2024	$ 523,509

Sensitivity of the Net OPEB Liability to Changes in the Discount Rate and Trend Rates

The following analysis presents the net OPEB liability using a discount rate of 3.65%, as well as what the City's net OPEB liability would be if it was calculated using a discount rate that is one percentage point lower (2.65%) or one percentage point higher (4.65%) than the current rate, a similar sensitivity analysis is presented for the changes in the healthcare trend assumption:

	1% Decrease 2.65%	Current Discount Rate 3.65%	1% Increase 4.65%
Total OPEB Liability	$ 564,842	$ 523,509	$ 486,055

	1% Decrease Healthcare	Current Trend Rate Healthcare	1% Increase Healthcare
Total OPEB Liability	$ 477,628	$ 523,509	$ 577,164

Deferred Outflows of Resources and Deferred Inflows of Resources Related to OPEB Benefits

The City reports information on deferred outflows and deferred inflows of resources at year end as well as a schedule of amounts of those deferred outflows of resources and deferred inflows of resources that will be recognized in other post-employment benefit expense for the following five years.

	Deferred Inflows of Resources	Deferred Outflows of Resources
Difference between expected and actual experience	$ -	$ 187,255
Changes in assumptions or other input	(63,340)	5,564
Benefit Payments	-	52,088
Deferred outflow (inflow) of resources	$ (63,340)	$ 244,907

Amounts reported as deferred outflows or inflow of resources related to pension will be recognized in pension expense as follows:

12. Other Post-Employment Benefits (continued)

Year ending June 30,	Amount
2025	$ 19,331
2026	19,331
2027	19,331
2028	21,921
2029	23,277
Thereafter	26,288
Total	$ 129,479

RHIA

Plan Description:
As a member of Oregon Public Employees Retirement System (OPERS) the City contributes to the Retirement Health Insurance Account (RHIA) for each of its eligible employees. RHIA is a cost-sharing multiple-employer defined benefit other postemployment benefit plan administered by OPERS. RHIA pays a monthly contribution toward the cost of Medicare companion health insurance premiums of eligible retirees. Oregon Revised Statute (ORS) 248.420 established this trust fund. Authority to establish and amend the benefit provisions of RHIA reside with the Oregon Legislature. The plan is closed to new entrants after January 1, 2004. OPERS issues a publicly available financial report that includes financial statements and required supplementary information. That report may be obtained by writing to Oregon Public Employees Retirement System, PO Box 24700, Tigard, OR 97281-3700.

Funding Policy:
Because RHIA was created by enabling legislation (ORS 248.420), contribution requirements of the plan members and the participating employers were established and may be amended only by the Oregon Legislature. ORS require that an amount equal to $60 dollars or the total monthly cost of Medicare companion health insurance premiums coverage, whichever is less, shall be paid from the Retirement Health Insurance Account established by the employer, and any monthly cost in excess of $60 dollars shall be paid by the eligible retired member in the manner provided in ORS 248.410. To be eligible to receive this monthly payment toward the premium cost the member must: (1) have eight years or more of qualifying service in OPERS at the time of retirement or receive a disability allowance as if the member had eight years or more of creditable service in OPERS, (2) receive both Medicare Parts A and B coverage, and (3) enroll in an OPERS-sponsored health plan. A surviving spouse or dependent of a deceased OPERS retiree who was eligible to receive the subsidy is eligible to receive the subsidy if he or she (1) is receiving a retirement benefit or allowance from OPERS or (2) was insured at the time the member died and the member retired before May 1, 1991.

Participating cities are contractually required to contribute to RHIA at a rate assessed each year by OPERS, and the City currently contributes 0.53% of annual covered OPERF payroll and 0.45% of OPSRP payroll under a contractual requirement in effect until June 30, 2024. Consistent with GASB Statement 75, the OPERS Board of Trustees sets the employer contribution rates as a measure of the proportionate relationship of the employer to all employers consistent with the manner in which contributions to the OPEB plan are determined. The basis for the employer's portion is determined by comparing the employer's actual, legally required contributions made during the fiscal year to the plan with the total actual contributions made in the fiscal year of all employers. The City's contributions to RHIA for the years ended June 30, 2022, 2023 and 2024 were, $806, $229, and $43, respectively, which equaled the required contributions each year.

At June 30, 2024, the City's net OPEB liability / (asset) and deferred inflows and outflows were not considered significant by management and were not accrued on the government wide statements.

13. Leases

For the year ended June 30, 2024, the financial statements include GASB Statement No. 87, Leases. The primary objective of this statement is to enhance the relevance and consistency of information about governments' leasing activities. This statement establishes a single model for lease accounting based on the principle that leases are financings of the right to use an underlying asset. Under this Statement, a lessee is required to recognize a lease liability and an intangible right-to-use lease asset, and a lessor is required to recognize a lease receivable and a deferred inflow of resources. For additional information, refer to the disclosures below.

As of June 30, 2024, Prineville, OR had 5 active leases. The leases have payments that range from $1,867 to $31,902 and interest rates that range from 0.7270% to .89%. As of 06/30/2024, the total combined value of the lease liability is $15,203, the total combined value of the short-term lease liability is $12,287. The combined value of the right to use asset, as of 06/30/2024 is $168,771 with accumulated amortization of $155,084 is included within the Lease Class activities table found below. The leases had $0 of Variable Payments and $0 of Other Payments, not included in the Lease Liability, within the Fiscal Year.

TOTALS	$ 2,711,938	$ 234,993

14. Subscriptions Payable

For the year ended June 30, 2024, the financial statements include GASB Statement No. 96, Subscription-Based Information Technology Arrangements. The primary objective of this statement is to enhance the relevance and consistency of information about governments' subscription activities. This statement establishes a single model for subscription accounting based on the principle that subscriptions are financings of the right to use an underlying asset. Under this Statement, an organization is required to recognize a subscription liability and an intangible right-to-use subscription asset. For additional information, refer to the disclosures below.

As of June 30, 2024, City of Prineville, OR had 2 active subscriptions. The subscriptions have payments that range from $4,200 to $13,000 and interest rates that range from 2.0240% to 2.4700%. As of June 30, 2024, the total combined value of the subscription liability is $0, and the total combined value of the short-term subscription liability is $0. The combined value of the right to use asset, as of June 30, 2024 of $25,687 with accumulated amortization of $14,841 is included within the Subscription Class activities table found below. The subscriptions had $0 of Variable Payments and $0 of Other Payments, not included in the Subscription Liability, within the Fiscal Year.

Source: Crook County Assessor.

Note: The City's permanent tax rate is $3.0225 per $1,000 of assessed value.

The debt service levy is set annually in the amount required to fulfill debt obligations and is the difference between the total direct tax rate and the permanent tax rate.

The City did not have an additional tax levy in FY 15 through FY 24.

(a) Property tax levy adjustments include discounts taken plus or minus roll adjustments. Property taxpayers are granted a statutory 3% discount when taxes are paid in full by the November 15th due date.

(b) Calculated as a percentage of the current year tax levy.

Purpose: Property taxes are the City's most significant own source of revenue. This schedule provides the user with basic information concerning property tax levy and collection ratios over time.

December 9, 2024

Independent Auditors' Report Required by Oregon State Regulations

We have audited the basic financial statements of the City of Prineville as of and for the year ended June 30, 2024, and have issued our report thereon dated December 9, 2024. We conducted our audit in accordance with auditing standards generally accepted in the United States of America and Government Auditing Standards.

Compliance

As part of obtaining reasonable assurance about whether the City of Prineville' financial statements are free of material misstatement, we performed tests of its compliance with certain provisions of laws, regulations, contracts, and grants, including the provisions of Oregon Revised Statues as specified in Oregon Administrative Rules 162-10-000 through 162-10-320 of the Minimum Standards for Audits of Oregon Municipal Corporations, noncompliance with which could have a direct and material effect on the determination of financial statements amounts. However, providing an opinion on compliance with those provisions was not an objective of our audit, and accordingly, we do not express such an opinion.

We performed procedures to the extent we considered necessary to address the required comments and disclosures which included, but were not limited to the following:

- **Deposit of public funds with financial institutions (ORS Chapter 295)**
- **Indebtedness limitations, restrictions and repayment.**
- **Budgets legally required (ORS Chapter 294).**
- **Insurance and fidelity bonds in force or required by law.**
- **Highway revenues used for public highways, roads, and streets.**
- **Authorized investment of surplus funds (ORS Chapter 294).**
- **Public contracts and purchasing (ORS Chapters 279A, 279B, 279C).**
- **Programs funded from outside sources**

In connection with our testing nothing came to our attention that caused us to believe the City of Prineville was not in substantial compliance with certain provisions of laws, regulations, contracts, and grants, including the provisions of Oregon Revised Statutes as specified in Oregon Administrative Rules 162-10-000 through 162-10-320 of the Minimum Standards for Audits of Oregon Municipal Corporations.

OAR 162-10-0240 Internal Control

In planning and performing our audit, we considered the internal controls over financial reporting as a basis for designing our auditing procedures for the purpose of expressing our opinions on the financial statements, but not for the purpose of expressing an opinion on the effectiveness of the internal control over financial reporting. Accordingly, we do not express an opinion on the effectiveness of the internal controls over financial reporting.

Independent Auditors' Report on Internal Control Over Financial Reporting and on Compliance and Other Matters Based on an Audit of Financial Statements Performed in Accordance With Government Auditing Standards

Year Ended June 30, 2024

PAULY, ROGERS, AND CO., P.C.
12700 SW 72nd Ave. ♦ Tigard, OR 97234
(503) 620-2632 ♦ (503) 684-7524 FAX
www.paulyrogersandcocpas.com

December 9, 2024

To the City Council
City of Prineville, Oregon

INDEPENDENT AUDITORS' REPORT ON INTERNAL CONTROL OVER FINANCIAL REPORTING AND ON COMPLIANCE AND OTHER MATTERS BASED ON AN AUDIT OF FINANCIAL STATEMENTS PERFORMED IN ACCORDANCE WITH *GOVERNMENT AUDITING STANDARDS*

We have audited, in accordance with the auditing standards generally accepted in the United States of America and the standards applicable to financial audits contained in *Government Auditing Standards* issued by the Comptroller General of the United States, the financial statements of the governmental activities, the business-type activities, each major fund, and the aggregate remaining fund information of City of Prineville as of and for the year ended June 30, 2024, and the related notes to the financial statements, which collectively comprise the basic financial statements, and have issued our report thereon dated December 9, 2024.

Report on Internal Control over Financial Reporting

In planning and performing our audit of the financial statements, we considered the internal control over financial reporting (internal control) as a basis for designing audit procedures that are appropriate in the circumstances for the purpose of expressing our opinions on the financial statements, but not for the purpose of expressing an opinion on the effectiveness of internal control. Accordingly, we do not express an opinion on the effectiveness of internal control.

A *deficiency in internal control* exists when the design or operation of a control does not allow management or employees, in the normal course of performing their assigned functions, to prevent, or detect and correct, misstatements on a timely basis. A *material weakness* is a deficiency, or a combination of deficiencies, in internal control, such that there is a reasonable possibility that a material misstatement of the financial statements will not be prevented, or detected and corrected, on a timely basis.

A *significant deficiency* is a deficiency, or a combination of deficiencies, in internal control that is less severe than a material weakness, yet important enough to merit attention by those charged with governance.

Our consideration of internal control was for the limited purpose described in the first paragraph of this section and was not designed to identify all deficiencies in internal control that might be material weaknesses or significant deficiencies. Given these limitations, during our audit we did not identify any deficiencies in internal control that we consider to be material weaknesses. However, material weaknesses or significant deficiencies may exist that have not been identified.

Report on Compliance and Other Matters

As part of obtaining reasonable assurance about whether the financial statements are free from material misstatement, we performed tests of compliance with certain provisions of laws, regulations, contracts, and grant agreements, noncompliance with which could have a direct and material effect on the financial statements.

However, providing an opinion on compliance with those provisions was not an objective of our audit, and accordingly, we do not express such an opinion. The results of our tests disclosed no instances of noncompliance or other matters that are required to be reported under *Government Auditing Standards*.

Purpose of this Report

The purpose of this report is solely to describe the scope of our testing of internal control and compliance and the results of that testing, and not to provide an opinion on the effectiveness of the internal control or on compliance. This report is an integral part of an audit performed in accordance with *Government Auditing Standards* in considering the internal control and compliance. Accordingly, this communication is not suitable for any other purpose.

December 9, 2024

To the City Council
City of Prineville, Oregon

INDEPENDENT AUDITORS' REPORT ON COMPLIANCE FOR EACH MAJOR PROGRAM AND ON INTERNAL CONTROL OVER COMPLIANCE REQUIRED BY THE UNIFORM GUIDANCE

Report on Compliance for Each Major Federal Program

Opinion on Each Major Federal Program

We have audited City of Prineville's compliance with the types of compliance requirements identified as subject to audit in the *OMB Compliance Supplement* that could have a direct and material effect on each of the major federal programs for the year ended June 30, 2024. The major federal programs are identified in the summary of auditors' results section of the accompanying schedule of findings and questioned costs.

In our opinion, City of Prineville complied, in all material respects, with the types of compliance requirements referred to above that could have a direct and material effect on each of its major federal programs for the year ended June 30, 2024.

Basis for Opinion on Each Major Federal Program

We conducted our audit of compliance in accordance with auditing standards generally accepted in the United States of America; the standards applicable to financial audits contained in *Government Auditing Standards*, issued by the Comptroller General of the United States; and the audit requirements of Title 2 U.S. Code of Federal Regulations Part 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards (Uniform Guidance). Our responsibilities under those standards and the Uniform Guidance are further described in the Auditors' Responsibilities for the Audit of Compliance section of our report.

We are required to be independent of City of Prineville and to meet our other ethical responsibilities, in accordance with relevant ethical requirements relating to our audit. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our opinion on compliance for each major federal program. Our audit does not provide a legal determination of compliance with the compliance requirements referred to above.

Responsibilities of Management for Compliance

Management is responsible for compliance with the requirements referred to above and for the design, implementation, and maintenance of effective internal control over compliance with the requirements of laws, statutes, regulations, rules, and provisions of contracts or grant agreements applicable to its federal programs.

Auditors' Responsibilities for the Audit of Compliance

Our objectives are to obtain reasonable assurance about whether material noncompliance with the compliance requirements referred to above occurred, whether due to fraud or error, and express an opinion on compliance based on our audit. Reasonable assurance is a high level of assurance but is not absolute assurance and therefore is not a guarantee that an audit conducted in accordance with generally accepted auditing standards, *Government Auditing Standards*, and the Uniform Guidance will always detect material noncompliance when it exists. The risk of not detecting material noncompliance resulting from fraud is higher than for that resulting from error, as

fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal control. Noncompliance with the compliance requirements referred to above is considered material if there is a substantial likelihood that, individually or in the aggregate, it would influence the judgment made by a reasonable user of the report on compliance about compliance with the requirements of each major federal program as a whole.

In performing an audit in accordance with generally accepted auditing standards, *Government Auditing Standards*, and the Uniform Guidance, we:

- Exercise professional judgment and maintain professional skepticism throughout the audit.
- Identify and assess the risks of material noncompliance, whether due to fraud or error, and design and perform audit procedures responsive to those risks. Such procedures include examining, on a test basis, evidence regarding compliance with the compliance requirements referred to above and performing such other procedures as we considered necessary in the circumstances.
- Obtain an understanding of internal control over compliance relevant to the audit in order to design audit procedures that are appropriate in the circumstances and to test and report on internal control over compliance in accordance with the Uniform Guidance, but not for the purpose of expressing an opinion on the effectiveness of internal control over compliance. Accordingly, no such opinion is expressed.

We are required to communicate with those charged with governance regarding, among other matters, the planned scope and timing of the audit and any significant deficiencies and material weaknesses in internal control over compliance that we identified during the audit.

Report on Internal Control over Compliance

A *deficiency in internal control over compliance* exists when the design or operation of a control over compliance does not allow management or employees, in the normal course of performing their assigned functions, to prevent, or detect and correct, noncompliance with a type of compliance requirement of a federal program on a timely basis. A *material weakness in internal control over compliance* is a deficiency, or combination of deficiencies, in internal control over compliance, such that there is a reasonable possibility that material noncompliance with a type of compliance requirement of a federal program will not be prevented, or detected and corrected, on a timely basis. A *significant deficiency in internal control over compliance* is a deficiency, or a combination of deficiencies, in internal control over compliance with a type of compliance requirement of a federal program that is less severe than a material weakness in internal control over compliance, yet important enough to merit attention by those charged with governance.

Our consideration of internal control over compliance was for the limited purpose described in the Auditors' Responsibilities for the Audit of Compliance section above and was not designed to identify all deficiencies in internal control over compliance that might be material weaknesses or significant deficiencies in internal control over compliance. Given these limitations, during our audit we did not identify any deficiencies in internal control over compliance that we consider to be material weaknesses, as defined above. However, material weaknesses or significant deficiencies in internal control over compliance may exist that were not identified.

Our audit was not designed for the purpose of expressing an opinion on the effectiveness of internal control over compliance. Accordingly, no such opinion is expressed.

City of Prineville

Independent Auditors' Report on Compliance for Each Major Program and on Internal Control Over Compliance Required by the Uniform Guidance

Year Ended June 30, 2024

The purpose of this report on internal control over compliance is solely to describe the scope of our testing of internal control over compliance and the results of that testing based on the requirements of the Uniform Guidance. Accordingly, this report is not suitable for any other

NOTES TO THE SCHEDULE OF EXPENDITURES OF FEDERAL EXPENDITURES

1. BASIS OF PRESENTATION

The accompanying schedule of expenditures of federal awards includes federal grant activity under programs of the federal government. The information in this schedule is presented in accordance with the audit requirements of Title 2 U.S. Code of Federal Regulations Part 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards (Uniform Guidance). Because the schedule presents only a selected portion of the operations, it is not intended to and does not present the net position, changes in net position, or cash flows of the entity.

2. SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

Expenditures reported on the schedule are reported on the modified accrual basis of accounting. Such expenditures are recognized following the cost principles contained in the Uniform Guidance, wherein certain types of expenditures are not allowed or are limited as to reimbursement. Negative amounts shown on the schedule represent adjustments or credits made in the normal course of business to amounts reported as expenditures in prior years. The entity has elected to use the ten percent de minimus indirect cost rate as allowed under Uniform Guidance.

3. FEDERAL LOAN PROGRAMS

The federal loan programs listed subsequently are administered directly by the entity and balances and transactions relating to the programs are included in the entity's basic financial statements. Loans outstanding at the beginning of the year and loans made during the year are included in the federal expenditures presented in the schedule. The balance of loans outstanding as of June 30, 2024 consists of:

CFDA Number	Program Name	Outstanding Balance at 6/30/2024
10.760	Water and Waste Disposal Systems for Rural Communities	$ 3,639,007

WHY PRINEVILLE?

8 REASONS TO DO BUSINESS IN PRINEVILLE, OREGON

Founded in 1981, EDCO is a non-profit corporation supported by private and public members and stakeholders. Our mission is to create a balanced and diverse local economy and strong base of middle class jobs in Central Oregon. To do this we help companies MOVE, START, and GROW here.

Access to regional workforce. Close to geographic center of the region and state as a whole.

Home to national data centers. Find out why Facebook and Apple chose Prineville.

Access to major highway system. Direct transportation connections to border states and newly paved commercial trucking routes.

Access to multi-modal freight. Prineville owns and operates one of the few city-owned railroads in the country with access to two class 1 railroads (Burlington Northern Santa Fe & Union Pacific).

Incentive programs for growing and relocating businesses. Tax al
low cost industrial land, fast-track permitting and fee reductions.

Favorable business costs. Competitive power, lease, wage and tax rates.

Prineville Chamber
Hey there, how can I help you?

Quality of life. Boating, camping, fishing, golfing, hiking, horseback riding, hunting, rock climbing, skiing, swimming, tennis and rafting all within 30 minutes.

Recent investments in education & healthcare. Career and technical training in manufacturing at Crook County High School, newly constructed Central Oregon Community College/Oregon State University Open Campus and new easily accessible St. Charles Health System facility.

City of Prineville - Child Care Fact Sheet

Quality child care during a child's early years of development increases their school readiness, and provides a solid foundation for a their later academic and behavioral success. Access to child care also results in increased workforce participation, particularly with women. Research confirms that greater economic development and more livable communities occur in areas where child care is in sufficient supply.

As Central Oregon continues to experience population growth, the need for increased quantity, quality and cultural responsiveness in child care grows significantly. Families need affordable and accessible child care. There is also a growing need for child care that offers non-traditional hours, is culturally and linguistically appropriate, and provides inclusion of special needs.

Demand grows while supply is limited. Nearly 2/3 of Oregon children have one or both parents employed. (OSU-2018) Yet, only 16% of children in Oregon under age 13 have access to child care. (OSU-2018). 26% of Oregon parents report that child care issues affect their employment. (Kids Count 2012) In 2018, 45% of parents in the United States report missing work due to child care issues, resulting in an average of approximately 8.6 days of work missed annually. That translates to $28.9 billion in wages lost by families nationwide that do not have access to paid leave and affordable child care. (ChildCare Aware)

Our community falls short, meeting only 17% of child care demand for children ages 0-5. As a county, we do worse, with an insufficient supply of only 15% of child care demand for children 0-5 years. In Crook County, with city population expected to continue to grow, and with minimal growth in child care providers; we have become a child care desert. This is an area with so few child care options that there are more than three times as many children as there are child care slots available.

This child care crisis is due to various barriers and limitations. Some problematic issues have been identified to include the following:

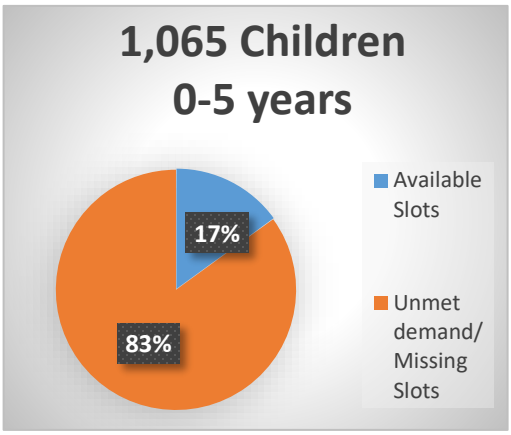
1. **Land**
    - Lack of availability.
    - Cost of land is not affordable.
    - Prohibitive city/county building costs.
    - Building/zoning limitations.

2. **Labor**
    - High attrition rate due to profession demands.
    - Child Care field does not provide a living wage.
    - Providers with increased professional development/education leave field for higher income employment.
    - Child Care providers lack professional development and business education.
    - Market failure (failure of market to efficiently allocate resources) due to spillover benefits. Child care providers can't charge more, and parents can't afford to pay more.

3. **Capital**
    - Expenses are high, while profits are low.
    - State subsidy reimbursement rates are low.

Child Care Supply & Demand

City of Prineville



Supply-

14 total child care providers (Child Care Resource & Referral Naccrraware - September 2018)

The Original Chapters of the Plan incorporates citizen, joint Planning Commissions, City Council, County Staff and other agency comments collected in 2004-2007. Subsequent updates to individual Chapters incorporated their own public process at that time.

Special Note: *This is Prineville's first individual Comprehensive Plan ("Plan"). Currently, the Crook County Comprehensive Plan covers the City. The City began the task to develop its own Comprehensive Plan as part of the State of Oregon Periodic Review Order and subsequent to the City completing the Urban Growth Boundary (UGB) expansion.*

There are many ways to design a City Comprehensive Plan and no two are alike. Prineville's Plan must be unique to Prineville and reflect the vision and expressions of the community. Therefore, this Plan is a "value driven" document. The intent of this format is to clearly incorporate the local values, goals and aspirations of the community. These values are recognized as the driving force behind the land use concepts advocated in the policies and goals contained within the Plan.

This Plan does not repeat unnecessary amounts of technical support data and exhibits that can be better located in an appendix. The result is a concise document that is easier to understand and more useful for citizens. The graphics and text in the plan may be subject to change, as new information is made available. However, it is timely to review the local value statements and other concepts to make sure they accurately reflect the desires of the community before proceeding to develop any implementing ordinances or revisions to local codes.

Special Thanks & Acknowledgements

The City of Prineville Comprehensive Plan could not have been completed without the assistance of our citizens. Their participation was invaluable to the success of the document and was instrumental to developing the values, goals, and policies that are needed to shape the future of Prineville.

Various public bodies and agencies also participated in the process and deserve special recognition for their efforts to refine the document. They are listed as follows:

City of Prineville:
City Council
City Planning Commission
City Staff

Crook County:
County Court
County Planning Commission
Crook County Natural Resources Committee
Crooked River Watershed Council
County Staff

State of Oregon:
Department of Transportation

Bureau of Land Management
US Fish and Wildlife
Corps of Engineers

Private Groups:
Greg Winterowd and Tim Brooks - Winterbrook Planning
Brooks Resources Corporation
Tia Lewis, Esq. - Schwabe Williamson and Wyatt LLP
Laura Cooper, Esq. - Ball Janik LLP

Special Recognition:
Special recognition and gratitude goes to DLCD Representatives Mark Radabaugh and Jon Jinings for their continued assistance in providing guidance to the City on urban and rural interface issues. Their dedication, professionalism, and overall helpfulness was essential in the development of our first, independent, Comprehensive Plan implementing the Statewide Planning Goals. Small cities, like Prineville, could not effectively complete periodic review and goal compliance tasks without assistance from DLCD. To that end, we are also thankful for the grant assistance and consideration of the Salem DLCD staff, Larry French and Rob Halliburton from which funding was provided for this task, and several other key projects.

Introduction

Purpose and Intent

The Prineville Urban Area Comprehensive Plan, known from here on out as the "Plan", is a dynamic and inspirational guide for directing and managing growth in the community. This document supersedes the previous Comprehensive Plan with Crook County and Prineville combined. The City of Prineville has chosen to have its own Plan and implementing land use ordinances.

The jurisdiction of the Plan applies to the areas within the Urban Growth Boundary (UGB). The Plan provides for and anticipates community-planning needs for all aspects of the urban environment. The Plan is a dynamic document that will be modified, refined, and changed from time to time when new values are determined. The City of Prineville will strive to manage those changes in a deliberate manner in order to reflect the desires and wishes of Prineville residents. Prineville's residents have made it clear that the small town feel of the community is a key feature of what makes the community livable and desirable. This Plan will focus on preserving this key feature.

Since 1973, Oregon has maintained a strong statewide program for land use planning. The State of Oregon requires that all cities conform to the Statewide Planning Goals as applicable. The foundation of that program is a set of 19 Statewide Planning Goals. The goals express the state's policies on land use and on related topics, such as citizen involvement, housing, and natural resources. Most of the goals are accompanied by ´guidelines, ´ that are suggestions about how a goal may be applied. As noted in Goal 2, guidelines are not mandatory.

Oregon's statewide goals are achieved through local comprehensive planning. State law requires each city and county to adopt a comprehensive plan and the zoning and land-division ordinances needed to put the plan into effect. The local comprehensive plans must be consistent with the Statewide Planning Goals. The State's Land Conservation and Development Commission (LCDC) review plans for such consistency.

When LCDC officially approves a local government's plan, the plan is said to be ´acknowledged. ´ After acknowledgement, the Plan becomes the controlling guide for implementing ordinances. Oregon's planning laws apply not only to local governments but also to special districts and state agencies. The laws strongly emphasize coordination -- keeping plans and programs consistent with each other, with the goals, and with acknowledged local plans.

A Summary of Oregon's Statewide Planning Goals

GOAL 1
CITIZEN INVOLVEMENT Goal 1 calls for "the opportunity for citizens to be involved in all phases of the planning process." It requires each city and county to have a citizen involvement program containing six components specified in the goal. It also requires local governments to have a committee for citizen involvement (CCI) to monitor and encourage public participation in planning.

GOAL 2
LAND USE PLANNING Goal 2 outlines the basic procedures of Oregon's statewide planning program. It says that land use decisions are to be made in accordance with a comprehensive plan, and that suitable "implementation ordinances" to put the plan's policies into effect must be adopted. It requires that plans be based on "factual information"; that local plans and ordinances be coordinated with those of other jurisdictions and agencies; and that plans be reviewed periodically and amended as needed. Goal 2 also contains standards for taking exceptions to statewide goals. An exception may be taken when a statewide goal cannot or should not be applied to a particular area or situation.

GOAL 3
AGRICULTURAL LANDS Goal 3 defines "agricultural lands." It then requires counties to inventory such lands and to "preserve and maintain" them through farm zoning. Details on the uses allowed in farm zones are found in ORS Chapter 215 and in Oregon Administrative Rules, Chapter 660, and Division 33. ***This goal does not apply to land within the Prineville UGB.***

GOAL 4
FOREST LANDS This goal defines forest lands and requires counties to inventory them and adopt policies and ordinances that will "conserve forest lands for forest uses." ***This goal does not apply to land within the Prineville UGB.***

GOAL 5
OPEN SPACES, SCENIC AND HISTORIC AREAS AND NATURAL RESOURCES Goal 5 covers more than a dozen natural and cultural resources such as wildlife habitats and wetlands. It establishes a process for each resource to be inventoried and evaluated. If a resource or site is found to be significant, a local government has three policy choices: preserve the resource, allow proposed uses that conflict with it, or strike some sort of a balance between the resource and the uses that would conflict with it.

GOAL 6
AIR, WATER AND LAND RESOURCES QUALITY This goal requires local comprehensive plans and implementing measures to be consistent with state and federal regulations on matters such as groundwater pollution.

GOAL 7
AREAS SUBJECT TO NATURAL DISASTERS AND HAZARDS Goal 7 deals with development in places subject to natural hazards such as floods or landslides. It requires that jurisdictions apply "appropriate safeguards" (floodplain zoning, for example) when planning for development there.

GOAL 8
RECREATION NEEDS This goal calls for each community to evaluate its areas and facilities for recreation and develop plans to deal with the projected demand for them. It also sets forth detailed standards for expedited siting of destination resorts.

GOAL 9
ECONOMY OF THE STATE Goal 9 calls for diversification and improvement of the economy. It asks communities to inventory commercial and industrial lands, project future needs for such lands, and plan and zone enough land to meet those needs.

GOAL 10
HOUSING This goal specifies that each city must plan for and accommodate needed housing types, such as multifamily and manufactured housing. It requires each city to inventory its buildable residential lands, project future needs for such lands, and plan and zone enough buildable land to meet those needs. It also prohibits local plans from discriminating against needed housing types.

GOAL 11
PUBLIC FACILITIES AND SERVICES Goal 11 calls for efficient planning of public services such as sewers, water, law enforcement, and fire protection. The goal's central concept is that public services should to be planned in accordance with a community's needs and capacities rather than be forced to respond to development as it occurs.

GOAL 12
TRANSPORTATION The goal aims to provide "a safe, convenient and economic transportation system." It requires communities to address the needs of the "transportation disadvantaged."

GOAL 13
ENERGY Goal 13 requires that "land and uses developed on the land shall be managed and controlled so as to maximize the conservation of all forms of energy, based upon sound economic principles."

GOAL 14
URBANIZATION This goal requires cities to estimate future growth and needs for land and then plan and zone enough land to meet those needs. It calls for each city to establish an "urban growth boundary" (UGB) to "identify and separate urbanizable land from rural land." It specifies seven factors that must be considered in drawing up a UGB. It also lists four criteria to be applied when undeveloped land within a UGB is to be converted to urban uses.

GOAL 15
WILLAMETTE GREENWAY Goal 15 sets forth procedures for administering the 300 miles of greenway that protects the Willamette River. ***This goal does not apply to land within the Prineville UGB.***

GOAL 16
ESTUARINE RESOURCES This goal requires local governments to classify Oregon's 22 major estuaries in four categories: natural, conservation, shallow-draft development and deep-draft

development. It then describes types of land uses and activities that are permissible in those "management units." ***This goal does not apply to land within the Prineville UGB.***

GOAL 17
COASTAL SHORELANDS The goal defines a planning area bounded by the ocean beaches on the west and the coast highway (State Route 101) on the east. It specifies how certain types of land and resources there are to be managed: major marshes, for example, are to be protected. Sites best suited for unique coastal land uses (port facilities, for example) are reserved for "water-dependent" or "water related" uses. ***This goal does not apply to land within the Prineville UGB.***

GOAL 18
BEACHES AND DUNES Goal 18 sets planning standards for development on various types of dunes. It prohibits residential development on beaches and active foredunes, but allows some other types of development if they meet key criteria. The goal also deals with dune grading, groundwater drawdown in dunal aquifers and the breaching of foredunes. ***This goal does not apply to land within the Prineville UGB.***

GOAL 19
OCEAN RESOURCES Goal 19 aims "to conserve the long-term values, benefits, and natural resources of the near shore, ocean and the continental shelf." It deals with matters such as dumping of dredge spoils and discharging of waste products into the open sea. Goal 19's main requirements are for state agencies rather than cities and counties. ***This goal does not apply to land within the Prineville UGB.***

The previous Crook County Plan addressed the above goals as required. This document conforms to the Oregon Revised Statutes, Department of Land Conservation and Development rules and regulations as well as the Oregon Administrative Rules governing the Land Conservation and Development Commission. The context of the Plan has been developed in cooperation with Crook County and the Urban Management Agreement provisions contained in the Appendix of this document.

Looking beyond the conventions of law, this Plan exceeds minimum legal requirements to get at what local citizens desire. It describes who lives in the community, reflects upon Prineville's history, documents its use of land, examines its roadways, studies its economics, systems and governance, and assesses its current physical and ecological environment.

This new Plan does much the same as the old Plan except that it is "value driven" and more clearly expresses the vision of the *urban* community. The Plan provides direction to the City decision makers based upon those values. This Plan is intended to serve as a guidebook for city officials, based on the community's real-life conditions by helping its officials make informed decisions.

The advantage to having a "value driven" Plan is that the community goals become the foundation for decision-making on a variety of levels within the local government. Values tend to have more meaning than long lists of temporary tasks that have a limited shelf life and require constant revision. The City of Prineville's Comprehensive Plan values are based upon locally established vision, long range-goals, and clear policies derived from extensive public participation and local knowledge of community leaders. Thus, the Plan contains goals and policies based on the City's values, set in the context of current and potential opportunities, concerns and capabilities. The Plan

is meant to last for the 20-year planning horizon and thus, the values of the community need to be clearly expressed in the Plan before any changes are made to the implementing ordinances.

Ultimately, this Plan is a useful planning tool that will help shape the City's zoning and subdivision regulations, capital improvement programming and budgeting, and other legal and regulatory actions necessary to manage Prineville's physical, social, and environmental character. All of these implementation tools must be consistent with this Plan in order to be consistent with State law.

Some elements of this Plan address several goals in order to retain consistency and ease of review for local citizens. To that end, the Plan contains the following elements:

- **Community Characteristics**
- **Land Uses and Zoning Designations**
- **Natural Environment**
- **Parks and Recreation**
- **Economy**
- **Transportation and Circulation**
- **Housing**
- **Public Services and Facilities**
- **Appendix**

Planning Process

Planning is an ongoing process that requires extensive public input to accurately capture the desires of the community. All too often, we hear about growth creating unwelcome or unanticipated changes that cause anger and frustration. This Plan seeks to resolve some of the issues related to growth by providing clear policies on what the built environment should look like and how it should operate. This requires a significant amount of meaningful public involvement.

The goal of meaningful public involvement requires balancing many individual concerns and goals to arrive at a vision that reflects the unique aspects of Prineville. Meaningful public involvement requires a certain amount of outreach in order to entice busy citizens to get involved. Public involvement does not have to require laborious or extended night meetings. Technology, community websites, varied communication methods and other techniques are readily available as an alternative to numerous meetings as a way to avoid waiting for hours to deliver testimony. Prineville's citizens are perceptive and ready to respond on a variety of levels and local city officials will continue to embrace the concerns of their constituents and taxpayers.

The Decision Makers

The City currently operates a City Manager/Council form of government. Citizens are encouraged to participate in Council meetings and decision-making proceedings. With regard to land use planning, the City Council appoints a 7-member Planning Commission to serve as a quasi-judicial body that acts as a research and fact-finding group to analyze research and make recommendations to the City Council regarding the appropriate use and development of land throughout the municipality. The Planning Commission serves as the primary citizen involvement committee consistent with the requirements of the State Land Use Planning Goal 1.

Local Values and Vision

Land use planning is more of an art than a science, and often fraught with legal jargon and the potential for vast amounts of litigation – yet land use planning can be straightforward and productive if we focus on the elements that make for a quality living environment.

The intent of this Plan requires focus on the planning techniques that replicate and preserve the best of Prineville's small town features. The community has expressed its desire to retain a "small town feel" as growth occurs throughout the community. The focus of this Plan is to make sure that the growth and redevelopment of the community adheres to this concept. One of these techniques requires a careful examination of neighborhoods and the local elements that influence livability.

This Plan will begin with an assessment of what makes Prineville's neighborhoods complete and livable. Prineville's neighborhoods are not just limited to residential areas but those areas necessary so people can work, shop and play within close proximity of their homes. This concept is the foundation of "complete neighborhoods" and often reflects the places we would like to live in. Again, it is understood that there will not be a cookie-cutter approach or attempts at a "one size fits all" template for Prineville. Likewise, this Plan contemplates changes over time that responds to future needs and concepts that are beneficial to the community. The goal of this Plan is to serve the needs of **all** citizens by providing many choices and opportunities for housing, employment, shopping, services, and recreation.

What is the Community Vision?

The best way to approach the development of this Plan is to first examine where the community has come from, and where the community wants to go, by beginning with an assessment of current needs and issues and examining previous plans as a basis. The previous County/City Plan expressed a vision of Prineville that was helpful for determining what the community issues were in the past. A vision of the future, based on previous goals in the earlier Plan is a good way to proceed. More current visions [as expressed by community participants in the planning process], is the second step, outlining possible policy directives and the formation of initial goals in response to current and emerging issues.

A more intensive and directed goal-setting exercise follows, followed still by the creation of policies designed to achieve those goals by guiding City and agency behaviors. Programs then emerge to implement the policies, allowing the City to create individual tasks that can be included in annual departmental budgets. As the years pass, the community can then review the execution of the Plan's programs, evaluating progress and revising the plan as necessary.

Planning, through a structured and deliberate process, creates and tests future scenarios. The results are a preferred course of action to achieve a desired result. The policies and programs included in this Plan reflect the Prineville resident's preferred direction and instruct community leaders on how to achieve the community's long-range goals. Thus, the Plan focuses on basic principles:

> ***Goals form policies, policies form programs and budgets, implementation occurs, and the result is accomplishment.***

The Prineville Comprehensive Plan must have solid community involvement during its review and preparation. Likewise, the Plan will function better if there is as much support as possible throughout its implementation. Prineville has used an array of public involvement techniques including a series of community workshops, design charrettes, a telephone survey, informational pamphlets in utility mailings, full-size posters and an interactive Web site to solicit and receive community comments on the plan, its vision, goals, policies and programs.

Chapter 1 Community Characteristics

Purpose and Intent

This chapter examines the community history and defines a variety of local urban elements that are essential for a high quality of livability. Those elements are then transformed into goals, policies and programs necessary to guide community growth and the visual aspects of the community.

What is our history and how has it shaped our past? How can you know where you are going until you know where you have come from?

The visual aspects of the Prineville community are unique. Dramatic geological features frame the community setting. The area is rich in history and contains many structures retained to provide a vital link between the past and the future. The community cherishes its' history and small town characteristics.

Incorporation of Prineville

Established in 1868, Prineville is the oldest community in the Central Oregon region, and one of the state's first incorporated cities. Prineville was incorporated in Wasco County that later became Crook County. The historic Crook County Courthouse, which has been in continuous use since its construction in 1909, stands as the community's dominant landmark. Like other towns in the region, Prineville's origins are tied to the land – agriculture and forest products manufacturing. In addition, like other communities in the region, it has diversified into other industries while keeping its well-established manufacturing heritage alive and well. In 1882, the Legislative Assembly established Prineville as the county seat. The voters confirmed the choice of Prineville, the only incorporated town in the county, in the 1884 general election. Prineville was named in honor of the town's first merchant, Barney Prine.

Barney Prine settled on the banks of Crooked River, where he built a blacksmith shop and a store-saloon. Prineville was the first and, for many years, the only town in the 10,000 square mile County, bounded by The Dalles on the north, Linkville (Klamath Falls) on the South, Eugene City on the west and Canyon City on the east. Before 1902, when the first high school was organized, anyone wanting an education beyond the 8th grade had to go to The Dalles or Eugene City. In March of 1877, Monroe Hodges rode horseback to The Dalles to file the first plat of Prineville. Prineville maintained its place as the trade center of Central Oregon until 1911, when the Union Pacific and Oregon Trunk Railways were extended south from the Columbia River to Bend. In 1917, recognizing that Prineville would fade unless adequate transportation was available, the citizens of the city voted to build their own railroad to join the OT and UP north of Redmond. Through years of low revenues and high costs, the City operated the railway. Finally, in the late 1930s and early 1940s, sawmills began to reap the harvest of the vast stands of Ponderosa Pine from the Ochoco Mountains. The lumber was shipped over the City of Prineville Railway, resulting in the title of, "The Largest Ponderosa Pine Shipping Center in the World". Therefore, the C of P Railway became an asset to the city, and further gained the distinction of being the only city-owned and operated railroad in the U.S.

Railroad History

The City of Prineville Railway is the last operating railroad company of a type of railroad that used to be quite common in the state of Oregon: a civic connection railroad

In the early years, railroad transportation was everything to a city. However, the large long distance railroads could not be responsible for building railroads to all of the tiny cities, some of which were quite insignificant points on the map. Therefore, as railroads were built, various groups of concerned citizens in the cities that were left out of the long distance railroad plans built their own connections to the large railroads.

Prineville was at one time the largest city in Central Oregon. However, neither the Oregon Trunk nor the Union Pacific backed Deschutes Railroad was planning to build a railroad to that city due to its location relative to the Deschutes river canyon. Therefore, in 1911 the Prineville & Eastern Railway was incorporated by concerned citizens. However, little came of the proposal. In 1916, the city council of Prineville decided to take things into their own hands. Voters passed the bond measure 355 to 1. The terms were not attractive to investors, but they were purchased later under slightly changed terms. Grading of the line began in 1916. By 1917 the company had a used steam locomotive on hand, and by 1918 the line had started offering freight and passenger service from a connection with the Oregon Trunk and the Des Chutes Railroad at Prineville Junction and the city of Prineville. The early years were difficult due to the small amount of traffic hauled. During the depression, the city defaulted on the bonds. Passenger service over the railroad ceased in 1939. During the 1930's, some hope did arrive. There were several small lumber mills built in Prineville. In the 1950's and 1960's, there was so much traffic on the line that the city tax rate was one of the lowest in Oregon due to the income from the railroad. It is still in operation, and is still owned by the city of Prineville. It is managed by a commission appointed by the city council. Passenger service over the line was put back in the mid 1990's in the form of the Crooked River Dinner Train. They are now operating steam as well, with a logging locomotive that is owned by the Oregon Historical Society.

Excerpt from A Brief History of the City of Prineville Railroad by Glenn Laubaugh

Crook County

Crook County was established on October 24, 1882. It was created from the southern part of Wasco County and named after U.S. Army Major-General George Crook, a hero of the Snake Indian Wars. Crook County is situated in the geographic center of Oregon. It has been reduced from its original size of 8,600 square miles to 2,986 square miles by the creation of Jefferson County in 1914 and Deschutes County in 1916. The current boundaries were established in 1927. Jefferson and Wheeler Counties bound Crook County to the north, Grant and Harney Counties to the east, and Deschutes County to the south and west.

Early Community Growth

Early routes over the Cascades were difficult to find and traverse, thus delaying development in the area until access was more developed. The first effort was in 1862 when a supply train with cattle crossed the Scott Trail. This was also the first group of non-natives to spend the winter in central Oregon. The discovery and development of the Santiam Pass in the 1860s made development of the area much easier. Today, the economy of the county continues to reflect certain elements of agriculture and forestry, but these resources are diminishing. Agriculture is supported by the development of irrigation districts, which permits the raising of hay, grain, mint, potatoes, and seed.

Range and forestlands allow grazing for a sizable livestock industry. The Ochoco National Forest's stand of ponderosa pine is the main source of lumber. As the lumber industry suffers with restricted timber harvest, tourism, recreation, and homebuilding are helping to strengthen the economy.

Population

The first census in 1890 showed a population of 3,244 excluding Native Americans. There has been a dramatic increase and fluctuation in the population's growth. The last several censuses have shown an increase in inhabitants with the 2002 population at 8,325 representing a 43% increase from the last census in 1990.

Crook County and Prineville have been growing at a rate that is more than twice the state average for the last 5 years. It has ranked in the top 10 (of 36 counties) for growth in number of residents for the past three years. In 1990, the town's population was 5,410, which has grown to 8,500 in 2003.

Recent Development

The community has been making significant public investments in expanding hospital facilities, a new high school, a new public library, a new public park and extensive playground, and fully serviced industrial park.

Prineville is also home to Oregon's third largest privately held company and third largest overall Central Oregon employer - Les Schwab Tire Centers. Schwab employs over 1,000 people in Crook County. The company has been in a steady growth pattern for quite some time, building two new warehouse/distribution centers in years 2002-2003 for a combined area of 1,089,000 square feet. These recent additions give Les Schwab over 2,000,000 square feet of warehousing to support the firm's 313+ retail tire stores throughout the West.

Other large manufacturers have made Prineville their home including Clear Pine Molding (Contact) and Woodgrain Millwork each with nearly 500 employees and Pioneer Cut Stock Inc.

Prineville also has a high concentration of trucking/ground transport companies. With seven regional firms based in the town, businesses in the region have excellent service and rates for transport to and from major markets. Outside the manufacturing and distribution sectors, agriculture still plays an important economic and cultural role for residents of the town and Crook County. Annually, the industry contributes more that $40 million to the local economy in commodities sold.

Livability

Prineville is a community with a strong identity. Community leaders must have the town's interests at heart and with the residents engaged in many civic activities. A good example is the connection between residents, businesses and the school system. Remarkably, Prineville has approximately 600 students involved in its School-to-Work program – an effort to provide students in the area with practical work experience in area businesses. The high level of community-wide participation contributes to the town's low dropout rate which is less than half that of the state average.

Prineville's low cost of housing is an asset to the community, with the one of the lowest median home prices in the region, and nearly the least costly average home price as compared to other communities in Central Oregon.

Climate

With a strong heritage in agriculture - rodeos, county fair, and outdoor recreation are very popular in the community. The town is also the gateway to the Ochoco National Forest, Painted Hills National Monument, and a host of lakes and reservoirs popular with boaters and fishermen. Near-year round golfing is a popular attraction for visitors and residents alike given that Spring comes earlier and Fall stays later in Prineville. The climate of the Prineville area is characterized by many sunny days with an average of 11 inches of rainfall and 14 inches of snow each year. The average temperature can fluctuate in summer and winter rising or falling 40 to 50 degrees in a single day. Prineville summer temperatures range from an average high of 85 degrees Fahrenheit with low humidity to a low of 44 degrees Fahrenheit. Winters average highs are in the 40's to lows in the 20's.

Fast Facts

- Prineville has Oregon's highest per capita of manufacturing jobs
- Oregon's largest School-to-Work program operated in Prineville through a partnership with the Chamber of Commerce
- The City of Prineville operates the last municipally owned freight railroad in the United States, a 17 mile stretch between the town and the shared mainline
- Prineville is its only incorporated city within Crook County's sizeable 2,982 square miles of area.

Environment and Geology

Prineville is located at the base of high plateaus and traversed by many natural drainage ways. Ochoco Creek and the Crooked River run through the center of the community. Various greenbelts and wildlife-rich riparian areas exist within the community. This situation offers opportunities to develop additional preservation greenbelts and multipurpose areas that can buffer these sensitive lands from the negative impacts of urban development.

The 100-year floodplains near the rivers are potential hazard areas for development. The land area within the Prineville UGB includes over 320 acres within the floodplain.

Many small drainage tributaries of the major streams have high flood hazard and erosion potential within localized areas. However, these localized flash flood conditions do not contribute significantly to flood conditions when channeled into the larger drainages. Many hazard areas can or have been partially, or totally, reclaimed through adequate engineering, especially where drainage can be provided within areas of high water tables. Seasonally high water table problems are caused by spring runoff of snow melt, by flood and sprinkler irrigation, and by soils with high enough clay content to make them impervious to ground water flow. The general soil boundaries indicating ground water problems have been further modified by engineering practices such as diversion canals, drainage ditches, and interceptor drain tiles.

The areas indicated as having extreme or moderate high water table's present problems for foundations, underground utilities, septic tanks, wells and adequate drainage. Engineering techniques may solve these problems. Consequently, increased development costs can be expected. There are approximately 760 acres of soils poorly suited for foundations in the Prineville Urban Area. These soils, also located within areas of high water tables, create additional limitations for sewers, water systems, and other underground utilities. Severe limitations also exist for roadways because of the soils' high shrink-swell characteristics. Problems associated with these soils include foundation cracking, settling and water damage to structures, and underground utility systems that may result in pollution of groundwater.

The general geology of Crook County is almost entirely volcanic in origin. The Clarno and John Day Formations are the most extensive with Columbia River Basalts, Dansforth Mascall Rim Basalts, Deschutes Formations and unconsolidated materials (i.e. alluvial valleys and terraces, etc.) following in decreasing order. The steepest slopes (in excess of 30%) generally pose higher development and maintenance costs for structures and utilities, although modern engineering technology and design may alleviate some or all of these limitations. Shallow rocky soils, high erosion potential, mass movement, septic tank limitations and low agricultural potential commonly characterize steep slopes.

Issues, Goals, Policies, and Programs

Prineville is a small rural community. It provides both shopping and employment for City and Crook County residents. The City was built along the rivers and railroad tracks, using the rail to ship the lumber and agricultural products that came into the town from the nearby farms. As the rest of Central Oregon grew, so did Prineville, but at a much-reduced rate given its distance from regional centers like Bend. State highways improved vehicular access to Prineville from points west, and the residential population found that the multiple access routes allowed for improved transportation to needed goods and services not readily available in Prineville. Today, new residents come to Prineville because of its small-town character and current low housing prices, locating their families in this community though their jobs; service and shopping needs may be elsewhere.

Prineville's street patterns and subdivisions testify to a value of open spaces and easy vehicular and large transport access. As time passed, there was a transition from the older streets lying parallel to the old railroad line to the newer ones paralleling section lines. Over time, orientation to the railroad gradually became less important. Subdivisions rotated to match section lines, accommodating rural land ownership patterns as surrounding farmland converted to residential and urban uses.

Prineville has historically attracted people for two primary reasons: one for its natural resource and recreation based heritage and another for its emergence as a small town within Central Oregon. Although previous traditional industries are rapidly diminishing, as illustrated by the reduction in the lumber and agricultural industries, new community construction is taking place on lands that were formerly farmed for many years or had a history of underdevelopment. Historic buildings do remain evident in the central business district and nearby neighborhoods. Longstanding businesses, with original facades and signage, are adjacent to newer establishments. Industrial areas are continuing to develop with needed businesses and manufacturing offering much needed jobs for the community.

A variety of shopping districts extend along the street systems. These separate the typical residential subdivision pattern that represents the style of single-family land development over the past century or more. Large numbers of established trees and open spaces still exist along the Ochoco and Crooked River within the urban areas.

Desired Community Development Characteristics

Prineville's residents agree the community's appearance is very important. Additionally, they are concerned about the transitions between different types of land uses and the influx of new development that is urban in nature. Citizens want to have a more stable economic environment that allows workers to avoid daily trips to other cities. They also want to have the shopping and service opportunities that larger cities provide without losing small town feel and becoming saturated with prototypical franchise and big-box architecture. The community's entries on the highway corridors need to be improved to define the character of the growing community for visitors and residents alike. Citizens want to recognize and utilize the surrounding agricultural, recreation, and natural areas while preserving views and maintaining a supply of open space around the community. Overall, citizens desire a quality living experience that allows them to raise their children in a safe and nurturing environment; an environment where children can grow up, get the education and jobs they need.

As the community grows, the public must determine what land use planning techniques are necessary for guiding and shaping new developments and how to revitalize re-developing areas of the City and urban area. The community must be able to guide and shape growth in order to achieve thoughtful and quality development. The concepts contained in this chapter are intended to ensure community growth and redevelopment enhances the local quality of life by:

- *Emphasizing and enhancing the community's small-town character*
- *Emphasizing the importance of providing a quality environment to raise children*
- *Providing for compatibility in land uses*
- *Promoting "complete neighborhoods" so residents are not inconvenienced by the lack of nearby essential goods and services, employment and recreation*
- *Emphasizing that the Downtown areas must be strong enough to compete with other nearby communities and strip commercial.*
- *Promoting quality of life for citizens by improving residential areas*
- *Encouraging strong activity in commercial and industrial areas*
- *Recognizing that the natural environment is an integral part of the community*

The implementation of the above concepts should result in a more interconnected community that meets the needs of Prineville's families, residents, visitors, businesses, and the environment.

"Complete Neighborhoods" are key to the success of Prineville

How we design and build our neighborhoods is of extreme importance to the community. The expected growth and expansion of the community will occur in and around the natural topographic features. This will create development patterns that result in large neighborhoods that cannot link up to one another. Because of this, newer neighborhoods must be as self-supporting as possible, meaning they should contain nearly all of the amenities and services (or easy access to those that are not in the immediate area) needed for daily living.

The overall goal for Prineville is to provide various neighborhood types ranging from small hobby farms, single-family and multi-family neighborhoods, to commercial and industrial use areas linked together by common features such as open space, trails, transportation networks, etc. Regardless of the type of neighborhood, all neighborhoods should contain specific types of convenience features and amenities, easily identified as essential to providing the lifestyle that Prineville seeks to maintain and build upon.

Neighborhoods should be designed to be self-supporting and contain mixed-uses, pedestrian amenities, open spaces, employment/shopping/service opportunities, and consideration of lands needed for public uses. The land uses may include elements necessary to complement and improve the adjacent or abutting existing urban form by utilizing planning techniques to reduce: traffic congestion and trip lengths, poor neighborhood design leading to urban and suburban sprawl, infrastructure costs, environmental degradation, and piecemeal development patterns that lead to additional community expense and subsidy.

The purpose of this section is to require the development of master plans for new or enhanced neighborhoods. The goals, policies, and programs in this chapter are designed to protect and enhance the community's neighborhoods. They address the interrelationships of spaces and systems incorporating the entirety of the community's physical environment in a manner that cannot be achieved in this plan's other chapters. These relationships shape community identity, providing the context in which the community residents live, work, move, and play.

Goal # 1: Improve the function and appearance of the community's residential neighborhoods, commercial and industrial areas.

Residential Neighborhood Values and Policies

Residential neighborhoods shall include the following features:

Master plan required. Before any required land division approval or design review approval, a master plan shall be prepared for all parcels and sites over 5 acres in size as of the date of adoption of this plan. Other types of development proposals may require master plans and/or master planning techniques.

"Complete neighborhood" land use and design standards. Neighborhood Master Plans shall be evaluated based on the adopted land division and zoning ordinance criteria as applicable, and shall also contain the following neighborhood design elements:

- Development of residential neighborhood lots shall use planned unit development techniques or zoning overlays to permit and control mixing of uses.

- Neighborhood lots shall be designed to be within 1200 feet of open spaces, parks or other recreational areas. Trails and sidewalks are considered to be basic infrastructure and may not to be considered as open spaces for meeting this requirement unless they are located in special preservation areas such as riparian areas, etc. The 1200-foot distance shall be measured along the proposed or existing walking surfaces such as ADA accessible sidewalks, trails, and streets.

- Neighborhoods shall include a mix of housing types to achieve at least 60% of the maximum density designated for the underlying zones, including non-residential lands. The mix of housing types shall not exceed the density for the underlying zone unless a public park greater than 3 acres in size is proposed to be within the neighborhood. In no case, shall the density exceed 10 % of the maximum density for the underlying zone and in no case shall the higher density dwellings be located next to existing lower density dwellings unless separated by a setback twice the requirement established for the residential dwellings.

- Neighborhoods shall include designation of public use lands necessary for schools, trails, emergency services, infrastructure support systems, transit amenities, and natural resource protection in accordance with this Plan and State law.

- Neighborhoods shall contain small blocks not exceeding 660 feet in length; with a maximum perimeter of 1,600 feet unless separated by open spaces and other recreational uses or when the City has approved an exception to block length.

- Neighborhoods shall contain open spaces, typical municipally-sized parks, in addition to trails, pocket parks, pavilions, squares, plazas, greenbelts, natural resource protection areas, structured and unstructured open space, etc as appropriate to the setting and density of the area.

- Neighborhoods shall contain employment/shopping/service opportunities located in areas that can be served by transit and easily accessed by residents in the neighborhood. Residentially oriented services (i.e. convenience stores, laundromats, cafés, etc.) shall not exceed a distance greater than 2640 feet (1/2 mile) from one another unless as approved by exception.

- The required neighborhood design elements shall be included in all master planned neighborhoods ***unless*** it can be proven that the abutting and/or adjacent developed lands include the elements necessary to meet the intent of this section. Adequate proof shall include studies, demographic data, and other suitable information to provide the City with factual data to support findings for approval. The expense for supplying the proof shall be borne solely by the property owner or applicant. The proof shall provide reliable evidence that the adjacent and/or abutting properties contain the elements necessary to create or complement the proposed neighborhood.

Programs:

The City shall draft and adopt design guidelines and other planning tools that educate, encourage and regulate the development of neighborhoods. Such planning tools include, but are not limited to the following:

1. Draft and adopt updated local zoning ordinance provisions to reflect the desired design element necessary to regulate growth.

2. Draft and adopt updated local land division ordinance provisions to reflect the desired design element necessary to regulate growth.

3. Draft and adopt a consolidated neighborhood overlay map showing potential new neighborhood areas.

4. Provide incentive programs when at all possible to encourage affordable housing in new neighborhood development.

5. Create a model urban living environment guideline

6. Draft and adopt neighborhood design guidelines

Commercial and Industrial Area Values and Policies

New commercial and industrial areas shall include the following features:

Commercial and industrial area development plan required. Before any required land division or design review approval, a development plan shall be prepared for all parcels and sites contemplated for development. The intent of these policies is to create "complete commercial and industrial areas" and avoid piecemeal development practices that can lead to unnecessary community subsidy and sprawl.

Land use and design standards. Commercial and Industrial development plans shall be evaluated based on the adopted land division and zoning ordinance criteria and shall also contain the following design elements:

- Planned unit development techniques or zoning overlays to permit and control mixing of uses. This may include access to sidewalks, trails, transit, open space, parks or other recreational areas.

- Architectural features that articulate the exteriors of large buildings to reduce the visual mass and enhance the architecture of the community.

- Outdoor amenities in the form of pocket parks, plazas, exercise facilities, on site cafes, day care facilities or other features that enhance the working experience for employees and reduce vehicle trips.

- Techniques to provide and implement design features that minimize the negative effects of infill development by improving compatibility with existing structures and land uses.

- Orienting the building primary access point to a public sidewalk or street.

- Planting and maintenance of suitable street trees.

- New parking areas shall, to the greatest extent practical, be placed around new buildings in order to avoid concentrations of parking and excessive walking distances from the street to the primary access point.

- Adequate off-street parking for bicycles.

- Adequate buffers from incompatible uses. *i.e. If new commercial and industrial uses are proposed to be located next to existing residential dwellings they must be separated by a side or rear yard setback twice the requirement established for the use.*

- Designation of public use lands necessary for schools, trails, emergency services, infrastructure support systems, transit amenities, and natural resource protection in accordance with this Plan.

- New development of commercial lots shall contain, at a minimum, 51% commercial use to minimize the exclusive use of a commercial lot as primarily residential

- Area studies containing analysis of the land uses contained within the perimeter of the development site. This may include demographic data necessary to show the quality and quantity of the existing commercial and industrial types, mixed-uses, open space and recreation areas, public use lands, trails and sidewalks, and utility needs. The City staff, in collaboration with the applicant proposing the development, shall jointly evaluate the commercial/industrial area study and determine what land uses are necessary to promote and implement the "complete industrial and commercial area" concept. The City may require certain missing commercial/industrial to be developed on or adjacent to the redevelopment property or require a pro rata cash contribution to the future development of such elements. The required "complete" design elements shall be included in all (re)development proposals unless it can be proven that the abutting and/or adjacent developed lands include the elements necessary to meet the intent of this section.

Programs:

The City shall draft and adopt design guidelines and other planning tools that educate, encourage, and regulate the development in commercial and industrial areas. Such planning tools include, but are not limited to the following:

1. Draft and adopt updated local zoning ordinance provisions
2. Draft and adopt updated local land division ordinance provisions
3. Provide incentive programs to encourage quality commercial development and infill projects.
4. Draft and adopt a consolidated neighborhood overlay map showing potential neighborhood redevelopment areas and needed commercial and industrial services and employment centers

5. Draft and adopt new commercial and industrial design guidelines
6. Draft and adopt design guidelines for single-family housing in commercial and industrial areas.
7. Develop incentives that encourage high quality building design in all new construction, renovations and rehabilitation
8. Require a high level of property maintenance throughout the commercial and industrial community
9. Review code enforcement role and procedures for effectiveness in abating zoning violations
10. Identify community entry locations to be revitalized and sponsor a competition for entry statement designs in cooperation with other civic groups, schools and volunteer organizations. Create welcoming and visually important entry statements along highway entries.
11. Develop parking standards that incorporate on street parking.
12. Reduce the distance pedestrians must travel when crossing streets, using sidewalk "bulb-outs" and pedestrian "islands" at key intersections.
13. Work with ODOT to make highway environments more walkable, particularly through the commercial core areas.
14. Install lighting that is more pedestrian in scale along popular walking corridors.
15. Orient and screen truck loading docks and service areas to minimize impacts on adjoining residential areas and to decrease or eliminate in street parking loading and unloading.
16. Locate parking lots to encourage pedestrian access to commercial uses from adjoining neighborhoods.
17. Locate and screen solid waste bins and recyclable materials to minimize impacts on adjoining residential areas.

Goal # 2: Improve and strengthen the function and appearance of the community's downtown central business district.

Local Business Incentives, Values and Policies

- Any project in the downtown central business district area may receive expedited City review and processing for any required land use procedure

- A downtown revitalization program shall be researched and developed to include incentives and other features desired by the community. These may include the following:
    1. Placement of buildings close to the sidewalk areas.
    2. Orientation of building entrances to streets and sidewalks.
    3. Reduced side and rear yard setbacks.
    4. Use of urban building materials that are compatible with historic structures and reduce energy consumption.
    5. Use of multiple-story building architecture for maximum utilization of land. Coordinate with the Crook County Fire and Rescue Department on building heights.
    6. Improved signage techniques.
    7. Street tree programs.
    8. Reduce the need for tractor-trailers to access the downtown area for supplies and services.
    9. Develop delivery systems that do not negatively affect pedestrians, shoppers, and traffic flows.
    10. Pedestrian amenities and improved crossing corners.
    11. Pocket parks and pedestrian rest areas.
    12. Improved lighting systems to improve nighttime commerce, (pedestrian scaled lighting), safety, and reduced impact on abutting neighborhoods.
    13. Reserved on street parking spaces for disabled, public transportation, maintenance and emergency services.
    14. Opportunities for public art and expression
    15. Parking district programs and other techniques to improve parking supplies for patrons.
    16. Placing overhead utilities underground shall be a priority.
    17. Improve outdoor trash storage and removal systems.
    18. Identify links to nearby neighborhoods and make sidewalk improvements.
    19. Establish consistent design standards for downtown streets, sidewalks, and pedestrian amenities.
    20. Encouraging a full spectrum of local businesses – i.e. hardware stores, theater, etc.

- Support the formation and continued operation of a business association and designate a staff liaison to attend Chamber of Commerce meetings

Programs:

The City shall:

1. Draft and adopt exemptions and special procedures for expedited processing of any development application in the downtown central business district.

2. Update and implement the Downtown revitalization program. This may include purchase, consolidation and assembly of property for sale or lease to key businesses.

3. Appoint a staff member to be a liaison for local businesses on downtown issues.

4. Review water/sewer services and projects to ensure adequate service delivery to the downtown area.

5. Update the existing Downtown Enhancement Plan and expand the borders of the "downtown core" as currently designated in the plan.

6. Revise the land division and zoning ordinance to allow mixed-use development.

7. Draft and adopt a design assistance program to help business owners, builders and contractors create new construction and renovation plans that enhance the central business district's character.

8. Explore the feasibility of urban renewal and other business improvement districts.

9. Coordinate with the downtown business owners for the creation and adoption of a sustainability plan for publicly owned projects and other developments within the downtown business district.

10. Coordinate signal timing with ODOT for maximum benefit to the urban area.

11. Take appropriate steps to encourage the development of truck stop facilities.

12. Provide information to builders on meeting or being exempted from universal access requirements in historic structure renovations.

13. Take appropriate steps to encourage the development of a multi-use path that connects downtown businesses with outlying residential neighborhoods.

Tourism and Visitor Values and Policies

Downtown central business district areas and the community in general can benefit from strong tourism and other visitor attraction strategies. These strategies include, but are not limited to the following:

- Improve coordination between City, local tourism agencies and Chamber of Commerce.

- Improved website and other web-based tourism enhancement techniques.
- Improved access to the historical assets of the community by developing heritage markers and/or interpretive signs for visitors and local residents alike.
- Improve and enhanced community entry areas.
- Maximize local railroad assets for tourism opportunities.
- Study seasonal differences in traveling public and target business and recreational advertising strategies to match needs.
- Sponsor children's activities and other venues to attract families and other visitors to the community.
- Examine strategies for improving choices in restaurants and entertainment options.
- Encourage key anchor stores in the downtown core, including businesses that encourage nighttime activities (i.e. movie theaters, quality sit-down restaurants, etc.)

Programs:

The City shall:

1. Inventory, document and photograph all historical assets within the community.
2. Work with local citizens to coordinate opportunities for accessing local historical assets and design a historic walking tour.
3. Coordinate and sponsor a competition for entry statement enhancements and designs in cooperation with other civic groups.
4. Acquire necessary property and obtain necessary approvals from ODOT for enhancing ROW areas for tourists and visitors.
5. Improve visual connections to the central business district by installing effective directional signs at logical street access points.
6. Study shuttle service from Redmond airport to Prineville's central business district and other commercial activity areas.
7. Coordinate with other local groups to develop a central business district hospitality study that includes activities for local youth.
8. Encourage travelers to spend the night and enjoy Prineville.
9. Work with local business groups to maximize coordination efforts and effectiveness of such programs.

Urban Land Use and Zoning Designations

April 2006

Chapter 2 Urban Land Uses and Zoning Designations

Purpose and Intent

The Prineville urban area contains land use descriptions and zoning for residential, commercial, and industrial areas. This chapter examines the different zone and land use designations and implementation strategies. The primary designations implement the strategies that regulate the use of land and its ability to support the community's long-term development objectives. The goals, policies and programs contained in this chapter will help the City manage its land uses to meet the growth needs of the Prineville community. It should be noted that the existing Comprehensive Plan Map, also known as the "Prineville Area Physical Development Plan", will need to be updated and various changes made given the age and poor drafting quality. Commensurate with revisions and improvements to the Comprehensive Plan Map, various errors were discovered on the 2006 Zoning Map. These errors and other needed revisions will be needed to improve consistency and compatibility with the revised Comprehensive Map.

Issues, Goals, Policies, and Programs

The anticipated growth of the community will create a variety of pressures upon local citizens, the environment, and infrastructure of Prineville. A variety of land uses and commensurate development regulations will help keep community values intact.

The intent of this chapter focuses on specific land use practices that provide the guidance necessary for accommodating growth while continuing to preserve, maintain, and enhance Prineville's community values.

Definitions

Marijuana Grow Site (MG) - means a location that grows and/or processes marijuana that exceeds the amounts allowed by State law for an individual or household.

Marijuana Facility (MF) - means a location where Marijuana is grown, processed, sold or dispensed or any combination of these activities which is registered by the State of Oregon.

Goal # 1: Create land use zones and land use regulations that enhance Prineville without sacrificing community values

Residential Zone Values and Policies

- Residential zones should be places where citizens can raise their families in a safe and nurturing environment.

- Residential zones that include amenities promoting family living environments and safe places for children to play walk to school, and experience natural resources are highly desired.

- Residential zones that include compatibility standards to facilitate transitions between new and established uses will help to alleviate the pressures of growth upon existing community residents.

- Residential zones that provide for a broad range of densities and housing choices avoid creating imbalances that require remedies using community subsidy or tax dollars.

- Residential zones must include outright permitted and conditional uses adequate to develop "complete" neighborhoods and suitable living environments.

- New residential developments shall analyze the impact of the new development upon community infrastructure, natural resources, and local cultural attributes before development can proceed. Any necessary mitigation plan shall be examined for feasibility and effectiveness in remedying the impacts. No new development shall be permitted which creates the need for subsidy by community members, in other words, "new development shall pay its' own way."

- Prineville has many natural features worthy of preservation and enhancement. New residential developments shall incorporate where practical, existing natural features into new projects as a way to protect the natural beauty of Prineville.

- Residential zones shall promote walk ability and connectivity to adjacent neighborhoods, open spaces, parks, and commercial nodes.

- Residential zones shall incorporate affordable housing concepts.

Programs:

The City shall:

1. Develop an overlay zone that identifies logical neighborhood boundaries that contain or could contain elements that support the development of "complete neighborhoods."

2. Examine the existing neighborhoods and determine what amenities are lacking in each area such as open space, trails, service centers, infrastructure, pedestrian amenities, etc.

3. Update local land use regulations to facilitate quality development allowing for the efficient development of complete neighborhoods.

4. Update local land use regulations to include compatibility standards that will accommodate new development while minimizing the disruption to the existing community.

5. Regularly monitor the housing supply and support land use changes that encourage more housing choices and proper supply levels.

6. Update local land use codes to ensure the community that new development pays its' own way and does not require community subsidy.

7. Inventory all natural features and cultural attributes that require special protection or special consideration prior to new development.
8. Promote the appearance of open space through clustering of building groups.

9. Create flexible zoning standards to allow for affordable and smaller lot sizes where appropriate and ensure compatibility with adjacent development.

10. Assess the connectivity of new residential neighborhoods with commercial nodes and schools, and assure that walkable distances are in place.

Commercial Zone Values and Policies

- Commercial zones shall be places that provide a wide range of services and goods to citizens in a convenient manner and without creating unnecessary subsidies.

- Commercial areas, nodes, and zones should be located throughout the community to provide convenient shopping, employment, and services to citizens in an efficient manner.

- Commercial zones must include outright permitted and conditional uses adequate to fully support the needs of the Prineville community.

- Commercial zone regulations should be flexible and include incentives to attract businesses to create a self-supporting community and competitive business environment.

- Commercial zones should provide adequate opportunities to locate and operate businesses so Prineville can be as self-sufficient as possible without requiring citizens to make excessive vehicle trips to other communities.

- Commercial zones should receive high priority for improved infrastructure and other government capital improvement programs.

- The downtown business commercial core area is a key feature of Prineville and should be enhanced to provide a draw for all citizens and visitors alike. Convenient and plentiful transportation and parking opportunities are necessary for the success of the downtown area.

- Commercial areas should provide not only service and shopping opportunities but adequate supplies of employment opportunities.

- Commercial projects that contain quality architecture, reflective of the locale and environment, mixed-uses, open spaces, pedestrian amenities, and adequate parking areas shall be required and promoted throughout the community as the city grows.

- Commercial projects that are aesthetically designed to blend in with the environment and are compatible with mixed-uses and residential areas will be encouraged over commercial developments that require large acreages and private parking fields.

- Commercial projects that maximize land spaces and are multi-storied with opportunities for upper-floor and/or offices and housing should be encouraged as a way to utilize valuable lands efficiently.

- Existing strip commercial areas can be unsightly, unsafe, and create excessive vehicle trips. Successful development strategies should include methods for redeveloping and improving the curbside appearance and function of existing strip areas.

- New extensions of commercial strip areas shall be developed only when it can be proven that needed services could not be provided to the community without developing lands at the ends of the exiting strips. Such new extensions shall be designed as centers with shopping streets or lanes instead of direct highway access. Building setbacks in commercial strip areas shall be such as to minimize distances onto sidewalks and streets, thus encouraging safe and easy pedestrian and bicycle access.

- New commercial areas, not at the ends of existing strips shall be designed as commercial nodes or centers to avoid creating new strip areas.

- Commercial areas should allow for service, repair and small manufacturing as a way to preserve industrial parcels in large acreages. Special incentives may be needed to control land prices for these uses.

- New commercial zones should be in areas where commercial and support services are needed and will thrive.

- Marijuana Facilities (MF) may be allowed in Commercial Zones through the application of Marijuana Overlay and process found in the City of Prineville Land Use Code Chapters 153, 153A and 153B.

- Marijuana Grow Sites (MG) may be allowed in Commercial Zones through the application of the Marijuana Overlay and permit process found in the City of Prineville Land Use Code Chapters 153, 153A and 153B.

Programs:

The City shall:

1. Develop an overlay zone or framework plan locating anticipated new commercial areas throughout the community.

2. Evaluate existing commercial zones and determine where and what business services are lacking within the community.

3. Update the local land use regulations in order to improve, enhance, and encourage quality commercial development, including modifying commercial zone setback requirements, parking standards, and bicycle parking requirements.

4. Evaluate and coordinate business incentive programs with other entities and economic development agencies.

5. Prioritize business area needs when developing infrastructure programs and capital improvement planning within the community.

6. Monitor and report on the quality, function, and improvement required of downtown area parking. A parking district program should be explored as a way to maximize parking opportunities.

7. Explore and develop incentives for locating more employment and upper story housing opportunities in the downtown area.

8. Develop a development guideline and site plan template for the downtown area.

9. Update local land use regulations to facilitate quality commercial development promoting efficient development of land and successful commerce.

Industrial Zone Values and Policies

- Industrial areas that are served by adequate community transportation, convenient connections to highway access, workforce housing, water, and sewer, communication, power and gas systems will have a competitive advantage in the Central Oregon Region.

- Industrial zones should provide the greatest density of manufacturing jobs per acre, exclusive of workforce housing, and be located in places that do not disrupt the function of other land uses.

- Industrial zones should provide places for manufacturing, repair, with potential for high concentrations of jobs, products, and services in areas that can be conveniently served by transportation and easily accessed by high numbers of employees.

- Industrial activities should include buffers to protect any nearby neighborhoods and/or workforce housing from the negative effects of industrial activities. Heavy industrial uses should be located away from residential neighborhoods.

- New Industrial zones should be located close to other industrial zones as a way to maximize available infrastructure.

- It is necessary to prioritize capital improvements in industrial areas to attract and retain industrial and manufacturing uses.

- Clean industries are preferred. Industries that produce excessive noxious airborne particulates and non-disposable hazardous waste may not be allowed.

- Industrial zones shall have vegetative buffers to reduce the negative impacts of large, plain buildings, outdoor storage, mechanical equipment, and large parking areas on adjacent less intensive zones or uses.

- Industrial areas that provide a wide choice of parcel sizes including workforce housing options and are highly desirable.

- Large industrial lots of more than 20 acres in size should be reserved as an enticement for attracting new industry.

- Small service, repair, and manufacturing industries should be encouraged to locate in commercial areas, if appropriate, as a way to retain large industrial acreages. Special incentives may be needed to offset the difference in land costs.

- Industrial areas that provide mixed-use opportunities and service uses for employees can reduce excess vehicle trips and community subsidy. They should be encouraged in industrial zones subject to proper siting and regulations that limit standard or non-workforce housing.

- Larger width streets are appropriate in industrial areas as are employee amenities including public, parks, day care, respite areas, trail connections, and other outdoor recreation opportunities.

- Incentives that retain and attract industries to Prineville will benefit the community as a whole by improving the employment and population balance and promote overall economic growth.

- Industrial areas near local airports can enhance commerce and attract compatible aviation activities and industries.

- Industrial areas near the City Railroad facilities can enhance commerce and attract supportive activities and industries. Industrial uses should be encouraged to use railroad facilities for transportation of heavy freight, thus reducing vehicular traffic on roadways.

- There are several older industrial zone designations within Prineville that are no longer appropriate due to: abutting development patterns; redevelopment and site changes that have occurred as a result of a declining timber industry; specific locational characteristics that are better suited to mixed-use urban development patterns; and, brownfield redevelopment opportunities. These unique areas should be converted to other uses subject to proper analysis, zone changes, and plan amendments as needed.

- Conversions of industrial lands to other uses shall only be allowed for development of mixed-use projects. These conversions will only be allowed when the zone change and plan amendment process includes studies, as appropriate, showing that the conversion does not negatively affect the 20 year supply of industrial lands.

- Marijuana Facilities (MF) may be allowed in Industrial Zones through the application of the Marijuana Overlay and permit process found in the City of Prineville Land Use Code Chapters 153, 153A and 153B.

- Marijuana Grow Sites (MG) may be allowed in Industrial Zones through the application of the Marijuana Overlay and permit process found in the City of Prineville Land Use Code Chapters 153, 153A and 153B.

Programs:

The City shall:

1. Maintain an inventory of industrial uses; analyze and determine desired uses.
2. Develop an overlay zone locating new industrial areas throughout the community.
3. Evaluate how to best improve the west entrances to the community adjacent to industrial areas.
4. Update the zoning ordinance to improve development patterns.
5. Develop incentive programs for locating new industry including workforce housing.
6. Modify the Transportation System Plan to include special street standards for industrial areas.
7. Work with local and regional economic development agencies to highlight Prineville as a dynamic place to locate and operate industrial businesses.
8. Coordinate industrial development with railroad facilities and encourage railroad use to the greatest extent possible. Special incentives may be applicable.
9. Monitor and evaluate the Prineville Layout Master Plan in order to provide coordinated land use and activity planning that enhances the nearby industrial areas.
10. Encourage nonpolluting industry.

Goal # 2: Update the UGB boundary when necessary.

Urban Growth Boundary and Policies

- The UGB must include all of the land needed for residential, industrial, and commercial development for ~~at least~~ a 20-year period.
- UGB reserve planning is a valuable tool for predicting future growth areas over a 50 to 100 year period. The appendix contains the map of the UGB expansion areas developed in discussion with property owners and as reviewed at various public meetings. See appendix for the UGB Reserve map.

Programs:

The City shall:

1. Periodically evaluate land capacities and land supplies for each zone and element of the General Plan every 2 years as appropriate.

2. Maintain adequate levels of residential, commercial, industrial, and recreation lands for a 20-year period.

3. Use a variety of methods to predict land needed for a 20-year period.

4. Prepare, adopt, and update infrastructure master plans to properly accommodate growth without excessive public subsidy.

5. Actively seek and acquire land needed for future infrastructure to avoid excessive land prices for property necessary for: transportation, water, and sewer improvements; telecommunication needs; energy needs; emergency service substations; gas; electricity; protection of natural resources; and, other needed facilities.

6. Regularly update and map population projections to support changes to urban growth boundaries and other land use planning tools.

7. Build community consensus and utilize a pragmatic approach when developing annexation programs.

8. Recognize the importance of the agricultural and urban interface areas and reduce conflicts between both uses as growth occurs.

9. The City shall initiate urban area reserve planning in the year 2007 and complete the study for presentation to the Planning Commission for review and recommendation to the City Council. The urban reserve planning study shall utilize a variety of predictive techniques; not limiting the study to just absorption rates, but taking into consideration selective industry incubation, local cultural desires, workforce housing and mixed use development techniques, infrastructure capacity, industry and commercial trending, economic and market studies, incentive programs, labor pool analysis, etc.

10. The City shall coordinate population studies and statistical review with Crook County.

11. The City shall develop an annexation program that evaluates and describes the ways and means of adding land to the City limits. The study shall include a variety of annexation techniques appropriate for a dynamic community and seek to minimize community anxiety about inclusion to the incorporated area. The study shall include a financial analysis describing the advantages and disadvantages of annexation with regard to tax revenues, expense of service delivery, and citizen expectations with a high emphasis on producing satisfaction rather than discord.

12. Prineville shall require open space buffers and/or other development techniques to reduce conflict between urban and agricultural areas.

Goal # 3: Broaden the availability of alternate mode transportation options by organizing land uses in an efficient manner

Alternate Mode Transportation Values and Policies

- Alternate mode transportation opportunities should be expanded as part of new development and redevelopment proposals.

- The topography of the Prineville community is mixed. The outlying areas contain various landforms that necessitate the creation of separate residential areas in-between the rimrock/plateau features. These areas will need to be developed as "complete neighborhoods" to provide proper service levels, infrastructure systems, reduced vehicle miles traveled, and other designs/devices that support alternate mode use.

- The Prineville community desires to move towards creating land use patterns that support a multi-modal transportation system. This technique will seek to connect all areas of the community resulting in greater sustainability of all resources in spite of the challenges created by the varied topography.

- Land use patterns can be improved by the use of master plans for certain developments. Master plans which emphasize aesthetics and community compatibility, circulation, landscaping, open space, storm drainage, utilities, building location and design, and access to commercial and community facilities will provide the most efficient use of land and encourage the use of alternate modes for transportation.

- Higher density residential areas that are within walking distance of shopping, jobs, open space, recreation, and transit services will use land efficiently without sacrificing the existing low density residential character.

- The existing street grid system, with modifications to enhance views and respond to natural topography, is a good way to provide connectivity between all uses and encourage alternate mode use.

- New developments and redevelopment projects that place housing within walking distance of shopping, services, employment, parks, recreation, and schools will be the easiest to serve with transit and other alternate modes of travel.

Programs:

The City shall:

1. Revise the land use regulations to recognize outlying areas will require special design considerations to avoid community subsidy and excessive vehicle miles traveled.

2. Consider efficient land use techniques as a way to use land efficiently and create better sustainability of resources.

3. Revise the land use regulations to include a requirement for master planning, as appropriate.

4. Revise the development regulations to encourage higher density residential development near shopping, jobs, recreation, open space, services, higher order street classifications, and future transit corridors.

5. Develop street standards that regulate the spacing, classification, and placement of needed street types. Higher order streets shall include elements beyond sidewalks to support alternate mode use, including but not limited to the establishment of bicycle lanes.

6. Update the City Code of Ordinances to require adequate bicycle parking facilities when deemed appropriate.

7. Create incentives and other land use regulations that support mixed-use development techniques. The regulations must include effective standards for mixed-use developments adjoining less intensive uses to reduce conflict between such uses.

Goal # 4: Establish appropriate land use regulations to support a sustainable community

Sustainable Community Values and Policies

- Sustainable development techniques and other sustainable community options should be part of many community functions and services.

- Sustainability concepts allow communities to use land wisely and sustain inventories of limited resources for a longer amount of time.

- The community will benefit from incorporating sustainability concepts throughout the governmental structure and the local planning program.

- The community should look to City government as a model for sustainability. Local businesses and industries could benefit from following the demonstrated success of the governmental sustainability programs.

- The community will be able to regulate growth and encourage compact development at the core of the city by providing incentives for infill and redevelopment projects.

Programs:

The City shall:

1. Examine and implement a sustainability program for all City resources.

2. Develop energy efficiency targets and guidelines for the construction, renovation or operation of municipal facilities, incorporating new technologies for passive solar lighting and heating, appliances, HVAC, insulation, high-efficiency fleet vehicles, cooperative purchasing strategies and other applications.

3. Coordinate and develop an informational flyer and website data to help local businesses create healthy and sustainable working environments.

4. Review regulatory, pricing, taxing, and capital improvement practices to encourage urban development within city limits and develop strategies for encouraging compact development of vacant or under-utilized land to limit pressure for expanding the city's boundaries.

5. Promote land use regulations that encourage energy conservation and reduce air pollution.

6. Monitor the sustainability plan for effectiveness and modify the plan where necessary to meet community expectations.

Goal # 5: Establish growth management tools and other strategies to pace land development with the ability to provide the required services within the community

Growth Management Community Values and Policies

- Prineville will need to utilize various planning strategies to accommodate growth and have a higher success rate for developing as intended and with minimum conflict.

- Properly accommodating future growth assures the community that new development and redevelopment are supported by adequate infrastructure.

- Infrastructure expansions and improvements at the core of the community tend to regulate growth at a pace that the community can accept without reducing service levels for existing residents.

- Capital Improvement Plans that support existing industry, commerce and residential areas before serving new urban lands typically utilize limited public funds in an efficient and practical manner without subsidizing growth.

- Growth models can help predict the intended pattern of growth and provide realistic development guidelines for developers.

- Development must "pay its own way" to reduce community subsidy and minimize the negative effects of growth.

- Limitations on development outside of the City limits will reduce unnecessary "leap frog development" and unanticipated City subsidy.

- Developers must be required to analyze the full impact of proposed development upon infrastructure, schools, parks, natural resources, cultural resources and emergency services before development.

- Marijuana Facilities (MF) and Marijuana Grow Sites (MG) may be allowed in Industrial or Commercial Zones through the application of the Marijuana Overlays and permit process found in the City of Prineville Land Use Code Chapter 153, 153A and 153B. Approval of the Marijuana Overlays found in the City of Prineville Land Use Code shall be required to:
    - be consistent with the Comprehensive Plan;
    - be suitable for the MF and MG in accordance with the Prineville Land Use Code;
    - be considerate of the public health, safety, and welfare;
    - be licensed by the State of Oregon.

- This policy establishes guidance for the siting of Measure 91 (aka Recreational Marijuana) marijuana grow sites and facilities in the City of Prineville as authorized by State Law and Federal Law. The City of Prineville has developed Comprehensive Plan Policies and Land Use Codes which establish how Oregon's Measure 91 is addressed by the City of Prineville. The City of Prineville is positioned to allow recreational marijuana grow sites, processing and facilities consistent with the Oregon Measure 91 in the event that circumstances change pertaining to Marijuana, including but not limited to changes of status at the Federal law level.

Programs:

The City shall:

1. Create a priority system for the planning and funding of local infrastructure improvements. Prioritize capital expenditures by a) mandated by legislative authority of State or City, b) maintaining the City's commitment to public health, safety, and welfare, c) maintaining the viability of existing facilities and services, d) increasing the efficiency of existing facilities and services, and e) expansion of the existing system for new services.

2. Utilize transportation system improvements as a growth control measure with highest priority given to projects within the City limits, and maintenance of existing facilities shall receive priority before outer area improvements.

3. Develop an overlay model of desired growth patterns and land uses.

4. Reject public development projects that are beyond the city's financial and physical capabilities to maintain and protect.

5. Analyze fiscal impacts of an annexation concurrent with analysis of potential revenues.

6. Abstain from annexing land without a concurrent waiver of M37 and other necessary requirements such as non-remonstrance agreements and support for future transit.

7. Consolidate the General Plan Map and the Zoning Map into one document.

8. Regularly examine impact fees and other implemented exactions for legal appropriateness and consistency in application.

9. Examine and update all processing fees to make sure that the cost of service is borne by those receiving it.

10. Encourage, monitor, and provide incentives for infill development over new projects at the fringe of the urban growth boundary.

11. Enter into discussions with Crook County to improve the current intergovernmental agreement.

April 2006

Chapter 3 Natural Environment

Purpose and Intent

The future of Prineville will be shaped by how the community decides to accommodate growth and balance that against preservation of various elements of the natural environment. The State of Oregon Goal 5 Guidelines establish that the following resources shall be inventoried: a. Riparian corridors, including water and riparian areas and fish habitat; b. Wetlands; c. Wildlife Habitat; d. Federal Wild and Scenic Rivers; e. State Scenic Waterways; f. Groundwater Resources; g. Approved Oregon Recreation Trails; h. Natural Areas; i. Wilderness Areas; j. Mineral and Aggregate Resources; k. Energy sources; l. Cultural areas. Local governments and state agencies are encouraged to maintain current inventories of the following resources: a. Historic Resources; b. Open Space; c. Scenic Views and Sites. Following procedures, standards, and definitions contained in commission rules, local governments shall determine significant sites for inventoried resources and develop programs to achieve the goal.

Prineville's topography and small town charm are inseparably linked with natural floodplains and drainage ways, air quality issues, sensitive riparian areas, steep slopes, varied topography, historic flooding potential, urban flora and fauna, and high water tables. Thus, Prineville will need to adopt development regulations to protect critical areas (sensitive fish and wildlife habitat, frequently flooded areas, steep slopes, wetlands) and preserve air quality. Regulations should be balanced with other local values and in conformance with state law. Efforts to protect the natural environment should focus on maintaining a balance between the economy and ecology of the area while enhancing the aesthetic and livability ideals of the community.

In 2006-07, the City contracted with Winterbrook Planning to prepare site-specific inventories of the location, quantity and quality of Goal 5 resources within and immediately outside the Urban Growth Boundary. Winterbrook worked with Crook County GIS staff to prepare detailed maps and spatial analysis of significant riparian corridors, wetlands, wildlife habitat and scenic areas.

The Goal 5 inventory "clusters" significant natural resource into the following contiguous natural resource sites:

1. **Barnes Butte Scenic Area and Hudspeth Drainage**
2. **Upper Ochoco Creek Riparian Corridor and Scenic Rimrock**
3. **Lower Ochoco Creek Riparian Corridor**
4. **Upper Crooked River Riparian Corridor and Scenic Rimrock**
5. **Lower Crooked River Riparian Corridor and Scenic Rimrock**
6. **Ryegrass Drainage Riparian Corridor**

Winterbrook also worked with Crook County staff to map significant groundwater resources and Goal 7 natural hazards, including steep slopes, slide hazards, floodplains and dry wash areas. There is considerable overlap between Goal 5 natural resources and Goal 7 natural hazards within the Prineville UGB: approximately two-thirds of Prineville's Goal 5 natural resource area is affected by one or more natural hazards.

Next, Winterbrook prepared a draft limited protection program for all significant natural resources. The limited protection program balances urban development needs with conservation of the Goal 5 resource site. Generally, this program begins with existing Crook County and Prineville regulations, and combines Goal 5 (natural resource) and Goal 7 (natural hazard) protection programs where appropriate.

Next, Winterbrook evaluated the economic, social, environmental and energy consequences of three alternatives:

1. full local protection of each resource site (allow no conflicting urban development);
2. no local protection (allow conflicting urban development without mitigation); and
3. limited protection of each resource site based on the draft Goal 5 protection program.

After considering the draft limited protection program and its ESEE consequences, the City adopted a final Goal 5 protection program that implements the following natural resource and hazard policies.

Issues, Goals, Policies, and Programs

The City of Prineville and the surrounding area lie in a spectacular basin framed by dramatic geological forms and resource lands. Area residents have quick and convenient vehicle access to a variety of rural areas, forests, reservoirs, recreational areas, rivers, creeks, and other open spaces. Some of these areas, such as the Crooked River and Ochoco Creek riparian systems, public lands, open spaces, parklands, and plateaus are within the city limits. Preservation and enhancement of surrounding natural environmental system is a vital aspect of the community. Providing trails and alternate mode access to these special areas is necessary to avoid capacity issues, encourage healthy lifestyles, and to encourage safe access by children and adults. Protection of these special areas offers more than just aesthetic benefits; they can preserve the community's natural beauty without sacrificing economic development.

Local area livability can be enhanced and growth can occur in and around special areas if development regulations take the following issues into consideration:

- Opportunities for trail connections to existing and planned public parks and other recreational activities
- Updating the Code of Ordinances to improve regulations related to natural hazards such as flooding, wildfire, etc.
- Special setbacks from cliff edges and architectural design requirements for hillside areas.
- Inventory and analysis of important wildlife habitat
- Enhancement of the urban forest
- Increased air and water quality
- Preservation of key open spaces
- Protection of local values regarding the social and ecological benefits of maintaining the natural environment

Goal # 1: Protect and enhance identified Goal 5 resources and other features of the natural environment using a variety of methods and strategies

Natural Environment Values and Policies

- Local citizens desire to be good stewards of their community's natural resources, including significant natural resource sites and natural hazards shown on the Prineville Goal 5 and 7 inventory.

- The local economy can benefit from efforts to protect the natural environment. Prineville considered the economic consequences of resource and hazard protection in its analysis of economic, social, environmental and energy (ESEE) consequences of alternative resource protection programs.

- Programs are needed to address the protection of the natural environment in a balanced and fair fashion given the urban development goals of the City. Prineville's limited protection program achieves an appropriate balance between urban development needs (employment, housing, schools, parks and institutions), conservation of significant natural resources, and protection of life and property from natural hazards.

- Riparian and wetland areas support important wildlife and ecology and should be retained and enhanced to the greatest extend possible. Wildlife habitat associated with rivers, creeks and wetlands will be protected by maintaining and enhancing riparian vegetation within significant riparian corridors.

- The creeks and rivers that traverse the community need special setback protection and corridor enhancement. Prineville has applied a three-tiered protection program that recognizes different levels of development that have occurred near Ochoco Creek, Crooked River, and the Hudspeth and Ryegrass Drainages.

- The cliffs and rimrock areas should be preserved and local regulations should be crafted to limit development intrusion into these areas. Prineville will continue to apply Crook County scenic setbacks along rimrock canyons as land is annexed to the City, and new local regulations will protect the rimrock face and talus slopes below.

- Barnes Butte provides the scenic backdrop and identity to Prineville, and is recognized as the community's defining scenic resource site. Prineville will allow for an appropriate residential development, while protecting Barnes Buttes and associated steep slopes, dry washes and raptor habitat through a three-tiered protection program.

- The Prineville community has long experience with damaging floods. Prineville will amend the floodplain ordinance to incorporate a "no net loss of flood storage capacity" standard. Significant riparian corridors and wetlands within the 100-year floodplain will have a high level of protection.

- Air inversion policy …[no change, or we could add language noting that tree conservation in riparian/wetland/habitat areas will have positive benefits for local air quality]

- The local water table is high in many areas of the community. To avoid further contamination of local aquifers, Prineville shall protect inventoried groundwater resources through adoption of a well-head protection ordinance as recommended by the Oregon Department of Environmental Quality.

- The open spaces and natural areas within the community need to be inventoried and networks of open space within the community shall be maintained and enhanced, including wildlife habitat corridors, storm water management areas, trails and other sensitive areas. Prineville will maintain updated inventories of Goal 5 natural resource and Goal 7 hazard areas.

- The local urban forest helps to create shade, improve respite areas, enhance drainage ways, and beautiful the community.

- Citizens should have convenient access to natural areas when practical and as long as sensitive areas are not diminished by such access.

- Children and other citizens will benefit from learning about and understanding the special characteristics of urban wildlife and natural habitats.

Programs:

The City shall:

1. Create an inventory of Goal 5 resources and natural areas that require special protection and new regulations.

2. Coordinate with the Crook County Parks and Recreation Department to develop an inventory of open spaces that can complement the system of parks and other recreational spaces.

3. Develop a system of linking open spaces, cultural/historic areas, natural areas, recreational areas, and public parks in coordination with the Parks District and other affected agencies.

4. Create a program that better informs the community about the importance of natural systems, cultural/historic areas, and open spaces.

5. Support and collaborate with the Parks District to keep the community Parks and Recreation Plan comprehensive and updated, outlining current and future requirements for open space and related Goal 5 resources.

6. Work with surrounding jurisdictions, including Crook County and BLM, to develop and implement a regional system of Goal 5 and open space corridors.

7. Evaluate and update all ordinances regarding riparian setbacks, flood plain protection, enhancement and development mitigation.

8. Encourage corridor development for riparian protection, pedestrian use, and wildlife routes.

9. Re-evaluate street design guidelines to include provisions for street trees, paths as alternatives to sidewalks, and plantings that provide shade and a variety of drainage controls.

10. Update and modify development regulations to provide protection of Goal 5 and other natural resources, reduce potential for flooding, and encourage private and/or public-private partnerships to protect and enhance sensitive natural areas.

11. Encourage revenue-producing activities in sensitive areas, resource land, and park and recreation development opportunities if they help protect natural features.

12. Leverage funding for habitat improvements by applying for grants to develop and protect natural areas, build trails, and sustain wildlife as appropriate.

13. Develop focused donation programs to help manage identified sensitive areas, naming of open spaces, riparian corridors, respite areas, waysides, trail segments, and other programs that can count toward grant match programs.

14. Encourage provision of open space with new development by providing developer incentives in addition to minimum standards in regulations.

15. Restore the functions of damaged wetlands and floodplains within the community by identifying a feasible variety of strategies and implementation techniques.

16. Create design guidelines to include provisions for critical areas and natural resource lands that minimize fragmentation of species and habitat due to development.

17. Limit development that diminishes desired or indicator species in or adjacent to fish and wildlife habitat areas.

Recreation Programs and Events

Management and Operations

Community Needs

Goal #1: In collaboration with the Crook County Parks and Recreation District and other partners, provide public parks, recreational facilities, trails, programs and events that meet the diverse needs of users, and that enhance the health, livability, and quality of life of the community.

- Policy 1. Promote a collaborative system to maximize the benefits of parks and recreation. Ensure a consistent and seamless arrangement for system operations.
- Policy 2. Activate parks, and facilitate the coordinated provision of recreation programs and events.
- Policy 3. Enhance existing parks and facilities and develop new opportunities to provide engaging community recreation and social spaces that meet the needs of residents, workers, and visitors now and into the future.
- Policy 4. Protect natural resources and provide trails to connect people to parks, open space and community destinations.
- Policy 5. Maintain and replace assets in a sustainable manner and preserve and showcase the area's historical and cultural heritage for future generations.

Chapter 4 Parks, Recreation and Open Space

Purpose and Intent

The State of Oregon requires that cities manage and operate adequate facilities for recreation and open space. Key elements of the parks plan required by the state include a map to indicate the location and boundaries of the park system, and appropriate zoning and map designations including objective land use and siting review criteria. Open space responsibilities also overlap with Goal 5 issues but the emphasis for utilization and preservation remains the same.

This chapter discusses how the City of Prineville intends to provide public parks and recreation areas and strives to strengthen the City's parks and recreation opportunities through land use strategies and inter-agency cooperation. Based on the Unified Parks and Recreation System Plan developed in collaboration with the Crook County Parks and Recreation District (CCPRD), this chapter describes existing conditions, community needs, goals, and policies related to the park system. The Unified Parks and Recreation System Plan is herein adopted by reference and provides a more comprehensive description of the park and recreation system and the long-term plan for the future.

The City and CCPRD have been successful working together to leverage resources for the parks and recreation system. With over 19 sites that represent approximately 915 acres of public parks and recreation facilities, and dozens of programs and community events, parks and recreation are a major part of community identity and livability and central to the area's long-term future.

Background

In 1983, voters formed the Crook County Parks and Recreation District with boundaries based on the City's urban growth boundary. The City owned and managed parks prior to transferring these sites to CCPRD. In 1990, CCPRD expanded its boundary through annexation and the current boundaries match the Fire and Rescue District, Fire Zone #2.

In 2004, CCPRD completed a Comprehensive Plan for parks and the improvement and development of District operations and administration, parks and facilities, and recreation programs. In 2021, the City completed its first comprehensive plan (the Unified Parks and Recreation System Plan) for parks and recreation in partnership with CCPRD and with support from Crook County. The Plan outlines priorities for the future guided by the community's vision, a technical analysis of needs, and a strategic approach to implementation.

Issues, Goals & Policies

Prineville's unique setting, climate and culture all influence park and recreation opportunities. Located in Central Oregon's high desert, Prineville is surrounded by agricultural lands and publicly managed open spaces including the Crooked River and Crooked River National Grasslands, and Ochoco National Forest. Many local schools also provide opportunities for public recreation and use during non-school hours. The area's many park and recreation opportunities are central to the area's high quality of life, but steady growth and continued demands on park services resources are important considerations for the future.

Park Land

Together, the City, County and CCPRD own or maintain 19 parks and facilities, totaling approximately 915 acres. Only two sites are outside of the city, but within the CCPRD boundary (Crooked River Wetlands and Ochoco Lake Campground). CCPRD serves a population of approximately 14,269 residents (2017 Crook County estimates) and covers approximately 60.8 square miles. Just outside the city, there are approximately 467 acres of state land, as well as thousands of acres of national forest east of the CCPRD boundary. The Crooked River Canyon (a designated Wild and Scenic River), Prineville Reservoir, and Ochoco Lake are also popular destinations nearby.

Park Inventory Summary

Park Type	Total Acreage	Total Sites
Neighborhood Parks	22.2	9
Community Parks	55.4	3
Natural Areas	120	1
Special Use Sites	239*	4
Undeveloped Parks	480	3

Source: Crook County GIS, City of Prineville. *Includes acreage for golf course, fairgrounds, Crook County RV Park, and Ochoco Lake Campground.

There are many different types of recreation facilities that offer places to play, relax, or gather. Ochoco Creek Park serves as the city's central park and offers the largest range of experiences, from community gatherings and play to off-street biking and basketball. Most parks provide restrooms, picnic facilities, and an open lawn area. Fewer sites offer places to play or dedicated natural areas as part of the park design. There are also several specialized facilities such as camping areas, off-leash dog areas, and public art/memorials.

In 2017, the City completed the Crooked River Wetlands to improve municipal wastewater treatment. The wetlands now provide a range of benefits from cost savings and recreational opportunities to educational and environmental benefits. The City also conducted major changes to

the water distribution system to improve water conservation efforts and protect the city's water supply. During this same time the City acquired the Barnes Butte Recreation Area, a 460-acre parcel located at the east end of the city limits.

Camping

CCPRD provides camping areas at three sites. Located close-in to Prineville, the RV Park borders the fairgrounds and offers a range of amenities for RVs, as well as camping and reservable cabins. In addition to campgrounds, Ochoco Lake and Haystack Reservoir provide access to water recreation, and also offer day use. A large percentage of CCPRD's budget stems from camping fees.

CCPRD Camping Areas

Site	Owner	Spaces	Amenities
Crook County RV Park	Crook County	• 81 RV sites • 9 tent sites • 2 cabins	RV hookups, laundromat, community room, WiFi, dump station, pavilion
Ochoco Lake	Oregon State Parks	• 22 tent sites • 4 hike/bike sites	Potable water, picnic tables, fire pits, restrooms, boat launch, trails, swimming
Haystack Reservoir	BOR	• 16 RV/tent sites • 3 reservable sites	Picnic tables, restroom, trails, boat launch, swimming

Trails

There are a variety of paved and unpaved trails in Prineville. The City's Transportation System Plan (TSP) lists a total of four off-street paved trails totaling approximately 3.2 miles competed as of 2013. In addition, many of the proposed bicycle plan elements of the Crook County TSP provide direct connections to the City of Prineville. Since this time, the City has been active in adding additional trails and connections to this network. As part of the Ochoco Mill Site redevelopment, the multi-use path on the east side of Combs Flat road has been constructed from 3rd Street south to the hospital.

The 66 Trail System provides the primary nearby single track trail access for all ability levels. The existing 2.3 miles of Lower 66 trails are contained within Oregon State Park property. Managed by the Central Oregon Trail Alliance (COTA), volunteers are actively expanding this trail system on both sides of Highway 126. Along with city trails, the Crooked River Scenic Bikeway extends 25 miles south from the City of Prineville, along Highway 27 to a point just below Prineville Reservoir's Bowman Dam.

Existing Off-Street Paved Trails

Trail	Approximate Length (miles)
Ochoco Creek Shared-Use Trail	1.7
Highway 26 Trail	1.0
O'Neil Highway Trail	0.2
Iron Horse Trail	0.3
Total	3.2

Recreation Programs and Events

CCPRD partners with other providers and volunteers to offer over 30 different programs, classes, events, and camps. For overall enrollment, fitness/health-related classes such as gymnastics and karate, and educational/technical classes such as dog obedience and hunter safety have experienced the largest recent enrollment. There is limited capacity for indoor spaces and facilities such as Ochoco gym and the Juniper Art Guild are at capacity for scheduling additional activities. CCPRD programs draw participants from within the CCPRD boundary and beyond. Based on enrollment data, there are a considerable number of participants that live outside the boundary.

Management and Operations

Prineville's major public agencies share responsibilities in providing parks and recreation services, including the City and School District. The City is responsible for management and operations of the golf course, Barnes Butte Recreation Area and the Crooked River Wetlands complex, while the School District provides public access to several indoor facilities and fields. To promote coordination, the Local Intergovernmental Committee involves members from each of the major governmental agencies at the local level, including the City, School District, and CCPRD.

Community Needs

Throughout development of the Unified Parks and Recreation System Plan process, the City and CCPRD relied on a range of events and activities to hear from the public and identify the types of ideas and improvements that will be needed to build a stronger system of public parks and recreation opportunities. The following are needs identified for parks and recreation areas within the City of Prineville and CCPRD boundary.

- Diversified, multi-generational experiences: In general, a focus on offering age-appropriate activities emerged as a key opportunity, as well as supporting activities that people of different ages could enjoy together. Many parks lack play areas or have play areas that are aging or limited in interest for different age groups. Providing more opportunities for teens

was among the top three areas participants would like to see expanded, followed closely by opportunities for older adults/seniors, and then kids (6-12). Another widespread recommendation involved providing more ADA accessible recreation opportunities.

- Opportunities for year-round enjoyment: Numerous responses captured a desire for Prineville residents to enjoy places to play or recreate year-round, particularly during winter months. In general, a common sentiment emerged, describing a lack of places to play and socialize indoors throughout the year. Questionnaire respondents identified covered and indoor spaces as the second greatest need for Prineville's parks and facilities.

- Repairing/replacing the community pool: Prineville's only community pool (the public pool at Ochoco Creek Park) was built in 1950 and CCPRD and pool supporters have been looking into options for its future. According to the questionnaire, building a new pool as part of a community recreation center was the top need by a significant margin (67%) and updating/rebuilding the existing pool also received strong support (27%). Further supporting this desire, questionnaire results showed swimming as one of the most popular activities.

- Integrating nature: A connection to nature stands out as a distinguishing aspect of Prineville's system. Prineville and the surrounding area offer a wealth of experiences from backcountry adventure and exploration to scenic routes and vistas. Community members and visitors enjoy spending time in nature and value large natural areas and undeveloped sites. Some of questionnaire respondents' most popular destinations are the trails looping around the Barnes Butte Recreation Area, the green space within Ochoco Creek Park, and the open space in the Crooked River Wetlands Complex. Residents appreciate these wild, undeveloped spaces, particularly for walking, exercising, dog walking, and observing wildlife. Connections to nature inspired a range of ideas for exploration.

- Expanded trail network: Prineville has good connectivity and an emerging trail system, with an even greater potential to expand the network. Similar to state and regional trends, walking and trail-based activities are of the top activities in Prineville. Building on the need for safe, walkable access to parks and the popularity of cycling, an interconnected multi-modal trail network linking Prineville parks is a major opportunity.

- Safe, family-friendly places: Questionnaire respondents who don't use parks in Prineville cited feeling unsafe/unwelcome as the primary reason (along with being too busy) keeping them from using parks. Prominent issues involve the perception of homelessness, antisocial behavior, drug/illegal activity and trash. Overall, community members are seeking improvements to make all of Prineville's public spaces feel comfortable, welcoming, and safe.

- Fiscal sustainability: Participants expressed concern about sufficient budget to maintain existing parks and facilities, renovate or add new facilities, and keep recreation costs affordable for community members. Parks management and quality may be compromised due to high demand and resource shortages.

Goal #1: In collaboration with the Crook County Parks and Recreation District and other partners, provide public parks, recreational facilities, trails, programs and events that meet the diverse needs of users and that enhance the health, livability, and quality of life of the community.

Policy 1. Promote a collaborative system to maximize the benefits of parks and recreation. Ensure a consistent and seamless arrangement for system operations.

The City shall:

- Follow a formalized collaborative approach to providing parks and recreation services. Work closely with CCPRD, the County, School District and other partners to ensure a collaborative approach to the provisions of park and recreation services. CCPRD will serve as the primary lead in providing these services.
- Coordinate the land use and development process. In the City of Prineville, the City will lead the land use development process using this Plan as a guide and coordinating with CCPRD and the County as applicable.
- Work with CCPRD and the Chamber of Commerce to explore opportunities for private recreational enterprises or public/private partnerships, and to promote tourism within the city and greater region.

Policy 2. Activate parks and facilitate the coordinated provision of recreation programs and events.

The City shall:

- Integrate the area's unique history and cultural heritage in the parks and recreation system.
- Provide signage and facilities to support environmental education and interpretation, including information on wildlife in developed parks and natural areas, particularly at points of interest such as trailheads, viewpoints and sensitive areas.
- Designate the Crooked River Corridor as a hub for recreation. The cluster of parks, natural areas, historic sites, and recreation areas along the Crooked River should be leveraged for natural resource protection, economic development, and community identity.
- Evaluate and improve park accessibility. Working with the CCPRD, complete an ADA assessment and/or transition plan to identify required upgrades in accordance with the Americans with Disabilities Act.
- Work with local partners to increase localized events and keep them relevant/stimulating.
- Collaborate with local and regional partners to build necessary infrastructure for bicycle tourism.

Policy 3. Enhance existing parks and facilities and develop new opportunities to provide engaging community recreation and social spaces that meet the needs of residents, workers, and visitors now and into the future.

The City shall:

- Continue leveraging park land level of service standards. Any decision to add new park land should consider a range of factors including park access, needed maintenance and ongoing operating expenses and additional factors as part of the land review process.

Existing and Future Park Land Levels of Service

Park/Facility	Total Existing Acres	Adopted Park Land Level of Service Standard (acres/1,000)	Existing Park Land Level of Service (acres/1,000)	2040 Future Level of Service (acres/1,000)
Neighborhood Parks	22.2	1.5 to 2	1.6	1.21
Community Parks[1]	73.4	5 to 7	5.1	4. 0
Total Developed Parks [1]	95.6	N/A	6.7	N/A
Natural Areas[2]	580	20+	40.6	31.6
Special Use Sites	239.3	N/A	N/A	N/A

Notes: [1] Includes Seehale Property (18 acres); [2] Includes Barnes Butte (460 acres).
Source: Portland State University Population Research Center, "2019 Annual Oregon Population Report Tables," Table 4 (population of Prineville and Crook County). Population of Crook County Parks & Recreation District was estimated by FCS GROUP; Existing population (2019) = 14,269; Future population (2040) = 18,348.

- Coordinate with CCPRD to implement adopted park dedication standards. CCPRD should continue to identify potential future neighborhood parks in future growth areas using approved park dedication standards, as well as other design and acquisition guidelines.
- Develop a land dedication policy based on the recommended classification standards and the anticipated cost of developable park land.
- Coordinate new park design and development with surrounding land uses. Design and develop parks that consider nearby neighbors and land uses.
- Design parks with consideration for sustainability, water quality, water conservation, and flood impact mitigation. All new recreation facilities should be designed and constructed using green design and development practices.
- Embrace park connections to water with waterfront paths, overlooks, and access. Collaborate with CCPRD to acquire strategic areas along rivers and canals to protect and conserve scenic, recreational and natural areas that are accessible to the community.
- Design all facilities for operational efficiency and safety, and for barrier free access as required by the Americans with Disabilities Act (ADA).
- Focus on place making to create parks as memorable and engaging places. Emphasize park design, site character, identity, and sense of place through the use of art, colors, plantings,

natural elements and topography. Incorporate natural, cultural and historical elements and interpretive/educational features.

Policy 4. Protect natural resources and provide trails to connect people to parks, open space and community destinations.

The City shall:

- Continue to build on the river corridor vision by focusing on continuous and connected greenways along the Ochoco and McKay Creeks, and the Crooked River for safe and efficient multi-modal connectivity and healthy wildlife habitat.
- Continue to develop a comprehensive and inter-connected off-street trail system that provides connectivity to destinations throughout Prineville and to surrounding destinations for bicyclists and pedestrians.
- Collaborate with State Parks to identify a solution for safer access to the 66 Trails.
- Create opportunities for residents and visitors to connect with nature, both physically and visually, including new or improved pollinator patches, protection or integration of native plants, introduction of urban wildlife corridors, and protection and access to natural areas.
- Integrate flood mitigation into site design. Parks in flood zones should be designed to control floodwater during rainy seasons, while also designed for passive recreation and non-motorized connections.
- Pursue master planning and phased improvements at the Barnes Butte Recreation Area. As part of ongoing planning, the City should work with CCPRD to examine potential for BLM lands near Barnes Butte.
- Acquire open space lands, when appropriate, as a means of protecting unique environments and providing passive recreation opportunities.
- Improve the urban tree canopy in parks and along street frontages.

Policy 5. Maintain and replace assets in a sustainable manner and preserve and showcase the area's historical and cultural heritage for future generations.

The City shall:

- Coordinate with CCPRD in maintaining park and recreation facilities based on the needs and characteristics of specific parks.
- In collaboration with the County and CCPRD, develop a reporting program for all park concerns or maintenance needs. Use the program to track the types of maintenance needs and park or facility "hot spots" to inform future workload planning and annual budgets.
- Working with CCPRD, ensure adequate staffing levels to deliver safe, high quality, and needed park and recreation services.
- Use sustainable, easy-to-maintain landscaping materials and practices in all parks.
- Develop and implement edge treatments to improve the management of the areas where traditional park features intersect with natural areas.

Chapter 5 Economy

Purpose and Intent

Goal 9 of Oregon's Statewide Planning Goals and Guidelines pertains to economic development. This goal calls for diversification and improvement of the economy. It requires communities to inventory commercial and industrial lands, project future needs for such lands, and plan and zone enough land to meet those needs. Thus, the City of Prineville is required, by law, to provide at least a 20-year supply of commercial and industrial land and commensurate infrastructure. The goal also requires that comprehensive plans shall "*include an analysis of the community's economic patterns, potentialities, strengths, and deficiencies as they relate to state and national trends*."

There is no dispute that successful commercial and industrial activity requires sufficient and suitable land inventories. Careful attention to the necessary space requirements and locational considerations of potential commercial and industrial uses is necessary to promote, maintain, and encourage a variety of local economic activities on lands that are competitively priced. It is generally understood that when the supply of economic lands are constrained, land prices unnecessarily increase and this could reduce Prineville's chances at attracting business.

In conformance with Goal 9, the City conducted and updated a Buildable Lands Analysis[1] in order to evaluate land availability and examined market trends. Other studies were also used to determine land supply and long-term land needs and together with the updated buildable lands inventory, are good data sets from which to derive assumptions about economic land needs. Local and regional experts have also supplied the city with information about other economic factors that affect Prineville. The findings derived from the Buildable Lands Analysis and other studies were used to address the key factors of Goal 9 identified above. The bulk of these data sets are located in the appendix.

Understanding the City's economic assets will also be a key task in analyzing the existing and future economy. Land use planning, permitting processes, infrastructure development and related efforts of the City will influence future business development. Coordination with local business groups such as the Chamber of Commerce and Economic development For Central Oregon will be essential to identifying what type of development enhancement and infrastructure is necessary to support desired industries. The City and private groups will need to work together and implement programs as necessary to help companies and new businesses easily locate in Prineville, expand, and stay competitive in the local and regional markets.

Issues, Goals, Policies, and Programs

Assumptions and Trends

The City of Prineville can play an active role in helping to support the local economy by continuing to enhance existing businesses and generate new activity. The local economy of Prineville is directly tied to land zoning and available supply, historical land uses, local and regional

---

[1] *The analysis has been updated as needed to reflect actual land absorption, City Council policy, and other relevant inventory monitoring factors.*

demographics, labor pool, suitable housing, public services and transportation facilities. City regulations have a direct impact on the ability of existing business to expand and attraction of new business.

Private and public economic development efforts should focus on strategies that increase the opportunities for existing businesses. Likewise, efforts should also focus on expanding the possibilities for future workers and entrepreneurs by offering opportunities for local citizens to stay in the community and obtain nationally competitive jobs.

The national economy, society, and environment are key factors that will influence the local economic climate of Prineville. This chapter illustrates Prineville's existing economic patterns and potential economic opportunities. The analysis begins with a review of the current economic state of economic development in Prineville and Crook County. It also is necessary to identify any obstacles to future enterprise. This type of analysis approach can strengthen the community's position as a unique, established, and attractive place to work, live, shop, and recreate.

Access and Location

The City of Prineville is a small community approximately 17 miles outside of the Highway 97 corridor, which is a vital link to the Willamette Valley and other metropolitan areas. The location of the community and proximity/distance from Highway 97 will continue to be somewhat of an obstacle for new businesses and industries that rely on speedy shipping and proximity to support services in Bend, Redmond, Portland-Metro and the I-5 Corridor. However, the charm of the area, quality of life, good development climate, Enterprise Zone, City-owned railway, volume of available land and lower land costs will continue to be elements that can help overcome the distance to regional highway issues. The recent development of the Millican Highway connection from Highway 20 (Burns) to Highway 126 at the industrial park will be an advantage for trucks looking to avoid the congestion in Bend and Redmond. Even though the community is removed for the Highway 97 corridor, the time savings gained from the Millican Highway connection will help to compensate for the loss in direct or origination trips. The addition of truck stop services near the intersection of the Millican Highway and Highway 126 will help to serve the industry while reducing the negative impact of the truck traffic upon the rest of the community at the City center.

Alternatives to Access Difficulties – A Focus on Technology

Difficulty in reaching convenient access to regional transportation corridors can be partially overcome by transitioning to a technology and knowledge-based economy. Jobs that rely upon the development of technology and the transfer of knowledge products do not necessarily rely upon large amounts of truck shipping necessitating regional highway access. Information and technology markets influence and support all types of industries from retail to wholesale to manufacturing and service firms. Such industry is changing the speed and efficiency of business operations, the skills of workers, and the expectations of consumers. As a result, business owners and employees in the technology industries do not need to solely rely on ground shipping to deliver products to customers. Linking economic development strategies to a technological based economy is a trend that will be critical to enhancing the local job market.

Downtown Prineville - The "Core" Commercial Area

Prineville has a viable downtown area, which serves as a central feature in the community. Various studies have shown that this is where the maximum effort should be expended to improve the retail business climate. The downtown area could benefit from the addition of commercially zoned lands as necessary to deepen lots and broaden redevelopment opportunities.

Other Commercial Areas

The existing development patterns and commercial zoning designations have given rise to commercial development adjacent to the primary roadways in a "strip" configuration. The negative effects of such strip development include:

- poor access control, conflict with ODOT, and undesirable access for commercial developments;
- shallow lot depth limiting future business or center–type development;
- poor sign control and limited aesthetic options;
- longer vehicle trips to reach needed shopping services; and,
- reduced opportunities for buffering between land uses.

Strip commercial areas on the edges of the community force shoppers to travel by cars along the primary access ways. Pedestrian and alternate mode opportunities are lost when commercial zones are located great distances from population centers and neighborhoods. In addition, sole reliance upon vehicle travel to reach strip shopping areas can lead to unnecessary vehicle travel and expensive widening improvements along major roads. The synergy of commercial activities is lessened when commercial uses are not located in centers or downtown. Mixed-use zoning and rezoning of certain parcels to provide enough land in sizes necessary to accommodate commercial centers rather than a continuation of additional shallow-depth strip commercial will be necessary to provide a better balance of commercial development and reduce unnecessary vehicle trips.

Industrial Areas

The community also has a major industrial area near the Prineville Airport and a railroad dependant industrial area in the NW quadrant. These industrial areas are top priorities for local decision makers concerning infrastructure planning and economic expansion incentives.

There are various older, industrial areas scattered around the city, but these tend to create incompatibility issues with adjacent residential and mixed-use areas as well as disrupt natural drainage ways and riparian areas. Some of these older industrial areas have been developed with residential uses and suffer from incompatible Plan designations. The City intends to rezone the undeveloped portions of these industrial areas to mixed-use areas and residential zones without negatively affecting the industrial land inventory. The trend to incorporate mixed-uses on lands that are incompatible with established residential uses will enhance the ability of the community to add more mixed-use zones throughout the urban growth boundary. The properties slated for proposed rezoning are shown on Map No. 3 in the appendix.

Critical Drivers of Prineville's Economy

Many factors drive an economy. Some are influenced by the global economy, others by federal and state policies, and still others by regional elements. Some factors are in the control of the community and others are not, yet they all interrelate. One of the first steps in developing sound

economic development plans is to understand what drives the local economy. The factors identified as those most directly affecting Prineville's economy included:

Types of Businesses:

- Traditional manufacturing businesses: products, components, machines, farm and construction equipment, woods, metals, glass, stone, fertilizer and chemicals, and composite materials.
- Emerging businesses: high tech, Internet, e-commerce, creative services, and, mixed-use developments providing jobs and workforce housing to reduce employee commute time/highway congestion.
- Support businesses: Suppliers, retail, services and repair, personal and business services. A variety of company sizes: from small to large - commensurate with growth trends.

Business Operations:

- Skilled workers
- Workforce housing
- Telecommunications capacity
- Access to support services
- Access to capital

Regional Development Factors:

- Infrastructure & transportation
- Land availability and cost factors
- Affordable housing
- Access to post-secondary education system

Business Climate Factors:

- Public policies, fees, land use restrictions
- Tax structure and Strong stable government
- Transportation options

Livability & Image:

- Small town charm, arts & culture, access to services
- Growth management
- Overall quality of life
- K-12 education system
- Access to health care
- Access to quality shopping and recreation

It is essential that Prineville's community leaders examine how these drivers, whether they are strengths or weaknesses, affect economic development planning. Businesses, industry groups, the Chamber of Commerce, city staff, community development representatives and others involved in the adoption of the Plan identified the following as *key issues* that will likely influence the future economy.

1. The ability to capture the growth in emerging industries such as high tech, software, bioscience, and e-commerce.
2. The ability to redevelop areas to meet density and employment goals while keeping a sense of place.
3. The need to consider small business and local services as part of the overall economic picture.
4. How to develop an image for Prineville that will support and retain existing businesses and attract new ones.
5. The link between Prineville's economy and that of the broader Central Oregon region.
6. How to identify, improve, and pay for the basic transportation and infrastructure needs necessary to facilitate business development.
7. How to develop and retain quality workforce housing.

Existing Economic Conditions – *National, State, and Local Trends*

The community will need to monitor and consider the importance of local and national trends and related economic activities as part of local growth management. For example, the *2000 Census, Economic Development for Central Oregon (EDCO)* and other local experts have provided data used to forecast certain features of the local economy. This data is utilized in the subsequent economic evaluation detailed below.

Labor Statistics and Trends

The unemployment rate in Crook County was at 4.4% in 2000, which was slightly lower than Central Oregon (Crook, Deschutes, & Jefferson County) at 4.9% but higher than the nation at 4.0% for the same year. The primary means of transportation for the local workforce was private vehicles where 69.3% of the workers drove alone while commuting to their jobs. Interestingly, 23.6% of Prineville's commuters carpooled to places of employment and only 3.3% walked to work.

Local Unemployment Rates as Compared to State and Nation

	Central Oregon	Oregon	U.S.
1996	8.7%	5.9%	5.4%
1997	8.1%	5.8%	4.7%
1998	7.2%	5.6%	4.5%
1999	6.7%	5.7%	4.2%
2000	6.5%	4.9%	4.0%
2001	6.9%	5.9%	4.8%
2002	8.0%	7.5%	5.8%
2003	8.0%	8.2%	6.0%
2004	7.0%	8.5%	5.5%
2005	6.1%	6.9%	5.1%
2006	5.4%	6.0%	4.6%

Crook, Deschutes and Jefferson Counties vs. Oregon and U.S.
Sources: U.S. data from January 2007 Employment and Earnings (BLS), Oregon and regional data from Oregon Employment Department.

Car commuting in Crook County is higher than other places in Central Oregon. This is expected because of the rural setting and distance from other employment areas in Bend and Redmond contributing to a higher commute rate. This situation will not change until the local population can support more industry, service and retail choices in the Prineville community.

	Central Oregon**	Oregon*	WA*	CA*
TRADE				
Plumber	$23.52	$24.40	$23.58	$20.36

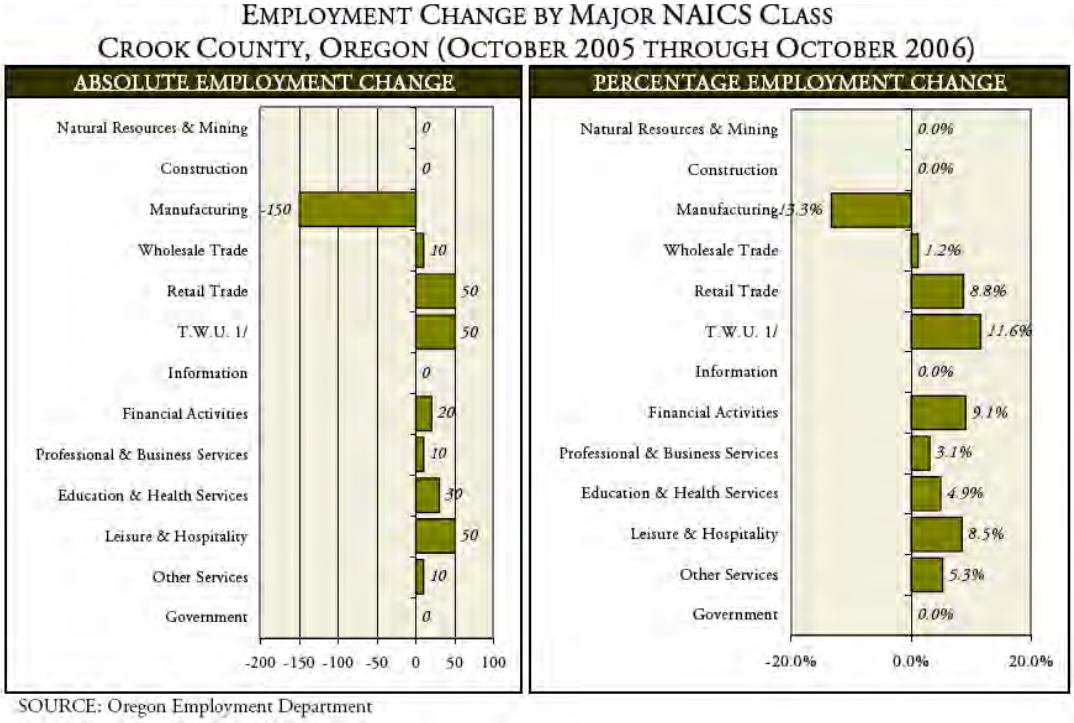
Availability of Products and Services

Competition for products and services currently provided by Bend and Redmond will typically continue until there is an adequate demographic base in Prineville to support additional shopping, employment and service needs of the community. The large commute has certain disadvantages in that it tends to over-utilize existing road capacities at peak hours and this creates a high subsidy for City and State transportation projects, etc. However, the ability for business owners to draw from a wide labor pool is an advantage and helps to broaden job choices for residents. As the community diversifies and moves further away from a farm and forest based economy the opportunities for more variety in employment *and* shopping choices is expected to increase.



SOURCE: Oregon Employment Department

Employment Changes

Industry growth was led by Transportation and Warehouse (11.6%), Financial Activities (9.1%), Retail Trade (8.8%), and Leisure and Hospitality (8.5%). Manufacturing was the only industry that had a net loss of jobs between October 2005 and 2006. The manufacturing industry lost 150 jobs for a decrease of 13.3%. This decrease is attributable to a decrease in wood product manufacturing. The Oregon Employment Department releases updated ten year employment forecasts every two years at the regional level. The most recent forecast (2004-2014) indicates an anticipated 17,520 job increase for Region 10. Future employment gains are expected to be realized largely through service sector growth. Roughly 50.3% of anticipated employment growth is projected to originate from Professional & Business Services, Education & Health Services, Leisure & Hospitality Services, and Other Services. Prineville and Crook County lie within State of Oregon Assessment Region 10. The Region 10 data indicate that non-farm income is dramatically increasing. These regional reports show that manufacturing, lumber remanufacturing production and service sectors are expanding as population growth occurs.

Primary Industries and Employers

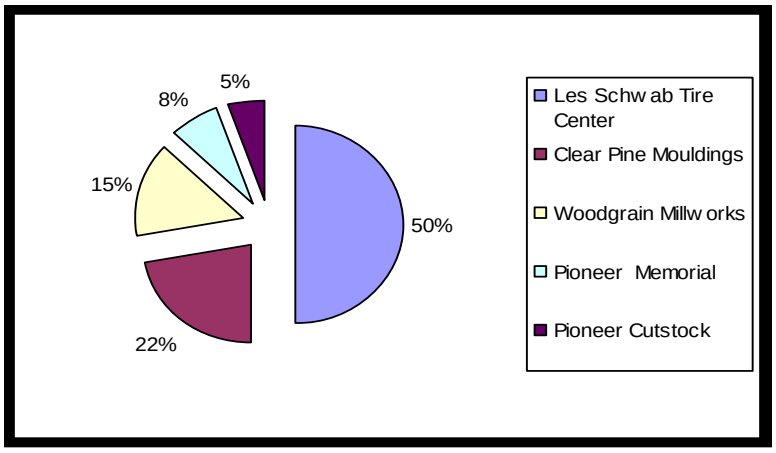
The primary industries in Crook County and Central Oregon are listed in the table below.

PRIMARY INDUSTRIES IN CENTRAL OREGON

County	Industry	Total Employment
Crook	Agriculture	400
	Distribution & Warehousing	1,402
	Education & Health Services	559
	Tourism	425
	Wood Product Manufacturing	1,084
Deschutes	Computer & Electronic Manufacturing	362
	Distribution & Warehousing	862
	Health & Social Assistance	5,908
	Professional, Scientific & Technical Services	1,889
	Recreational & Transportation Equipment	1,110
	Tourism	7,652
	Wood Product Manufacturing	1,920
Jefferson	Agriculture	630
	Health & Social Assistance	198
	Manufacturing & Fabrication (includes Wood Product Manuf.)	1,264
	Recreational Equipment Manufacturing	250
	Tourism	556

Local occupations are distributed among several areas and are consistent with the recent Census data. Management, professional, and related occupations cover about 21% of the employed individuals in Prineville; 26.7% in production, transportation, and material moving; while another 37% work in the sales, service and offices occupations. Farming accounts for only 2.5% of city occupations and less than 1% of total revenue generated in Crook County.

Top *Private* Largest Employers in Prineville



Prineville has the highest per capita of manufacturing jobs in the state. The demand for remanufactured wood and secondary wood products, high number of ground transportation companies (7), and the Les Schwab distribution plant are the primary reasons for this situation.

Annual Population Estimates
State, Regional, & Local Trends (2000-2006)

Region/ Location	Year (July 1st Estimates) 2000	2001	2002	2003	2004	2005	2006	00' - 06' Growth	05' - 06' Growth
Oregon	3,436,750	3,471,700	3,504,700	3,541,500	3,582,600	3,631,440	3,690,160	1.2%	1.6%
Region 10	155,050	161,300	166,550	170,700	176,350	186,865	198,205	4.2%	6.1%
Crook County	19,300	19,850	20,200	20,300	20,650	22,775	24,525	4.1%	7.7%

SOURCE: Oregon Population Research Center

Despite healthy population increase over each of the last six years, a significant population influx occurred in 2005 which displayed 10.3% growth in a single year. It is predicted that inflation in housing prices in competing markets, namely Bend and Redmond, is largely responsible for Crook County's recent popularity. Over the next twenty years, the Oregon Office of Economic Analysis fully expects regional and County-level population to continue a healthy growth pattern. Through 2025, State forecasts estimate an additional 91,382 individuals are expected to permanently reside within Region 10, 9,090 of which to be captured by Crook County, a capture of roughly 9.94%. Additionally, roughly 82.3% of anticipated Crook County population growth will be realized through net immigration.

Over time, and as the population increases, the trend will be for more diversification in job choices. According to the Oregon Employment Department report, Employment Projections by Occupation 2002-2012[2] the community can expect to see the greatest job growth in the following occupational areas:

- Health Care
- Professional and Technical
- Service and Retail including hospitality services

The increase in health care jobs is much different from the current local situation and is primarily due to an expected increase in young families with children, and an older population made up of retirees and baby-boomers. As the older population and general population increases so does the need for more choices in medical services. Health care professionals are in current demand and this is expected to continue as the largest growth area. The City will need to provide the proper amount of developable and adequately zoned lands to accommodate the expected increase in healthcare businesses and medical services. Prineville's small town charm and high level of livability will continue to attract young professionals and entrepreneurs. The retail and service markets will need to respond to this influx in order to meet demands of the growing population, particularly as housing choices increase. The City will need to provide the proper amount of developable and adequately zoned lands to accommodate the expected increase in professional, technical, service, and retail professions.

Specific Employment and Industry Projections

The 'snapshot" of data tables below provide a more precise projection detail for a period of 10 years beginning in 2004. This data is derived from the 2000 Census and information prepared by the Oregon Employment Department (OED). This type of projection is useful for analyzing the current land use ordinances to make sure the community can adapt to the projected needs.

Generally, the current ordinances are adequate, although a few modifications are needed to better support desired outcomes.

State of Oregon • Employment Department • www.QualityInfo.org • RS PUB 246 R10 (0106)

The predictions for commerce and industry growth do not show a large increase in the type of high employment, large industrial development that Prineville and EDCO hope to attract to the community and region. However, the current economic incentives, limited land supply in other nearby communities, and the level of commitment shown by local leaders may dispel the predicted trend and lure additional large manufacturing, industrial, and technologically-based businesses to the community.

The OED predictions do not take into account the current lack of desirable industrial land in Bend and Redmond. This factor alone has proven to be valid with the recent development of several new industrial parks near the Prineville Airport and brisk 2004-2006 land sales in adjacent industrial areas. Developers are keen to focus on Prineville now that there is a better selection of industrial parcels to choose from in the UGB. The selection has been enhanced by the recent UGB expansion, which added over 540 acres of industrial land to the UGB.

Existing Economic Conditions Conclusion

Prineville's local leaders encourage quality development and job creation. While retail, service, and the health care industry will continue to grow and expand, community leaders have aggressively focused efforts on attracting large industrial development. It is anticipated that these efforts will bring forth industries that rely on a large number of employees and create additional family-wage jobs in the community. Community leaders have made it clear that large industrial development is needed in addition to the sectors identified in the predicted trend data. Likewise, there is a companion goal to reduce the daily commute for local residents by the creation of additional family wage jobs within the community.

According to Economic Development for Central Oregon -EDCO staff –

> ***"Central Oregon has steadily diversified its employment and economic base. For the past decade, Deschutes County has lead Oregon in high technology growth (over 270%). Numerous companies from the Silicon Valley, Portland-Vancouver Metro, and Puget Sound have relocated or expanded here - escaping skyrocketing costs, electricity shortages and tight labor markets. Many of these firms are small but extremely innovative, producing niche-market products from semiconductors to software, medical instruments to recreational equipment."***

Competitive wages relatively lower housing costs, and high quality of life features will continue to attract businesses and companies to the region. Prineville will need to supply adequate levels of skilled labor force, developable lands and increased housing choices to continue to be attractive to new business development as a way to compensate for less-than-perfect access to key highways.

Overall, Central Oregon is a desirable place to locate businesses and while the region is not on the I-5 corridor there are certain advantages to the area given the labor rate comparisons and other positive demographic features. Oregon's largest School-to-Work program operates in Prineville, through a partnership with the Chamber of Commerce.

Existing and Proposed Industrial Opportunities - Industrial Land Site Requirements

Prineville has a variety of industrial areas spread throughout the community. A few industrially zoned lands suffer from a lack of performance standards, which can lead to compatibility issues with adjacent residential neighborhoods. The transition from a lumber based economy to tourism and locational factors have rendered some industrial parcels ripe for redevelopment into other less intensive or mixed uses. As older industrial areas transition to mixed-uses and new industrial areas are created, the City will need to explore alternatives to incompatibility issues including but not limited to rezoning, mixed-use development techniques and additional setback and compatibility standards.

THE OCHOCO LUMBER MILL PROPERTY - A REDEVELOPMENT SITE

A few industrial areas such as the former Ochoco Lumber Mill site lie adjacent to the UGB and along Highway 126. The redevelopment of these types of sites will require careful planning and use of mixed-use development techniques as a way to avoid the negative effects of additional strip commercial development patterns. The Ochoco Lumber Mill site is too close to residential uses to continue as heavy manufacturing. Thus, a new type of zone, one that is compatible with adjacent development patterns, is more appropriate.

Numerous discussions with the owner of the Ochoco Lumber Mill property have revealed that they wish to potentially develop a mixed-use project on the site. This would include commercial, industrial, open space and housing activities. The owners have stated that they also intend to enhance the alignment of Ochoco Creek and its floodplain where it crosses the site and develop suitable buffers and separation from the nearby existing neighborhoods. This type of redevelopment is consistent with Plan objectives and helps to diversify the economy as it further transitions from lumber to other needed business types.

The recommended "complete neighborhood and commercial/industrial area standards" contain good compatibility requirements and will help to buffer industrial uses from other activities. The industrial areas that are close in and near the higher population areas contain the largest variety of industrial uses. It is expected that as land prices and population increase the existing heavier industrial uses will transfer to other less populated outlying areas. Traditionally, the smaller industrial uses such as service and repair or contractor services have located close to the urban core. The heaviest concentrations of industrial lots are in industrial parks as described below.

Murphy Industrial Park

Located in Prineville, the Murphy Industrial Park consists of 14.7 acres of light industrial zoned property with 10 lots ranging from 1 to 3.39 acres. The property is located 1/4 mile east of Hwy 26 and Hwy 126 and within Prineville's new enterprise zone. The Murphy Industrial Park is located in Prineville's designated Oregon Enterprise Zone, which offers qualifying businesses 100%, 3-5 year property tax exemptions on new, qualified investment in plant and equipment. The site is served with all utilities and is very nearly flat, ensuring ease of development.

Baldwin Industrial Park

The Baldwin Industrial Park offers exceptional values on land and structures, as well as easy access to Hwy 126. The Park is part of the City of Prineville's newly developed industrial area and within the city's enterprise zone. The Park is only 17 minutes from the regional airport in Redmond and less than a half hour to Bend. The site is served with all utilities and is very nearly flat, ensuring ease of development. Forty (40) total acres are available with lots ranging from ¾ of an acre to over 5 acres. The Baldwin Industrial Park is located in Prineville's designated Oregon Enterprise Zone, which offers qualifying businesses 100%, 3-5 year property tax exemptions on new, qualified investment in plant and equipment.

Tom McCall Industrial Park

Crook County and other private developers own over 100 acres known as Tom McCall Industrial Park near the Prineville Airport[3]. The site is served with all utilities and is very nearly flat, ensuring ease of development. Certain development regulations imposed by the County control the purchase price and business plan of prospective developers. The intent is to preserve large parcels for industrial campus uses needing large site requirements.

Tom McCall Expansion - Prineville Industrial Park

[3] Crook County also owns over 1000 acres in the vicinity, which could be converted to future industrial uses.

The Tom McCall Expansion, known as the Prineville Industrial Park is 118 acres in size and privately owned. The property abuts the County industrial lands and wraps around the Oregon Youth Association - OYA facility. This facility will be converted to Oregon National Guard uses. A variety of lot sizes are available ranging from .5 to 50 acres in size. Airport access to taxi ways may be available at the southern end of the property. There is an increasing need for additional access to the airport form adjacent lands. The FAA has traditionally discouraged such access but the viability of the airport depends upon such services.

Prineville Airport Business/Industrial Park

The Prineville/Crook County Airport includes two runways with the largest offering a 5,000-foot runway capable of handling jet traffic at an elevation of 3,246 feet above sea level. Pilot activated runway lighting and fixed base operator (FBO) services are available. The airport has several sites available for industrial and commercial development but is for lease only.

Local Efforts to Target Desired Industries

Economic Development for Central Oregon (EDCO) has focused their efforts in attracting new business and industry by targeting specific types of development. These include:

General Industry Cluster Targets

- Aerospace and Aviation
- High Technology (includes software, hardware and biotechnology)
- Light Industrial and Manufacturing (Plastics, assembly, printing, misc.)
- Recreational Equipment Manufacturing
- Research and Development Firms
- Secondary Wood Products
- Headquarter Firms

Within these broad categories, 21 of the nearly 1,000 SIC (Standard Industry Classification) Codes have been chosen by EDCO as specific targets for growth and recruitment. They include:

Specific Targets

2396 Automotive Trimmings, Apparel Findings & Related Products
2542 Store and Office Fixtures (except wood)
2732 Book Printing
3751 Motorcycles, Bicycles & Parts
3792 Travel Trailers and Campers
3799 Transportation Equipment, NEC
3845 Electro medical & Electrotherapeutic Apparatus
3721 Aircraft
3728 Aircraft Parts & Engine Parts
7371 Software Development, Custom
7372 Software Development, Prepackaged

3082 Plastics Profile Shapes, Unsupported
3089 Plastic Products, NEC
3672 Printed Circuit Boards
5099 Durable Goods, Wholesale, NEC
2541 Store and Office Fixtures, Wood
2674 Bags, Uncoated Paper & Multiwall
3086 Plastics Foam Products
3087 Plastics Resins, Custom Compounding
3674 Semiconductors & Related Devices
3949 Sporting & Athletic Goods, NEC

All of the above targets are suitable uses in the Prineville community. However, the City wants to attract clean industries and avoid those that can cause harm to the environment or create potential City subsidy. This goal may mean that some industries may need to be carefully examined for potential community pollution. The City will need to make sure that the industrial and commercial zoning regulations can accommodate the future development industries identified above.
As mentioned above, the identified target industries do not necessarily match the forecasted local trends. However, this does not mean the desired industries are unsuitable for Prineville. On the contrary, the local desires, and State/National trends are **all** to be considered when developing the assumptions used to support this economic opportunities analysis.

Industrial Land Inventory Needs Analysis

Prineville is the only incorporated city within Crook County's sizeable 2,291 square acres. Prineville would like to provide jobs in the community for all of it's' citizens and not suffer the negative impacts of the daily commute to other cities. The City of Prineville cannot meet this goal at present. Efforts to induce additional job creation are underway and were given a boost by the 2004 UGB expansion that took in an additional 540 acres of land for industrial purposes. The responsibility to maintain a supply of adequate industrial lands, and provide a sound industrial climate to support additional job creation is a continuing responsibility of the City as part of the Goal 9 requirements and City Council policy.

The development trend in Prineville is primarily a product of reaction to a changing lumber and agricultural base. Lands that were devoted to primary lumber manufacturing have either ceased operation or transformed to respond to market needs and available lumber supply.

From the mid-1980's until 2003, some industrial lands were permitted to allow development of non-industrial and/or commercial uses. These decisions were part of an effort to retain business and help provide jobs in the community. Higher land prices and limited supply of commercial land exacerbated this situation. However, this technique created problems with compatibility to primary industrial uses and tended to underutilize valuable industrial land resources. Better efforts at coordinated economic development strategies, appropriate mixed-use land development, and incentives to encourage commercial development in appropriate locations will reverse this negative trend.

The City intends to preserve industrial areas for predominantly industrial uses. This may be difficult in light of M37[4], but development of incentive programs such as the Enterprise Zone and the City's required M37 waiver as a condition of annexation will be helpful to preserving industrial lands for future economic development.

Numerous parcels of land in the UGB are inappropriately designated industrial. The zoning of these parcels will need to be corrected and appropriately zoned. The largest of these parcels are known as the Ochoco, Smith, Carpenter, and Rhoden sites. These were not considered prime industrial lands in the Benkendorf report and/or in related City studies. Other parcels of land containing residential homes have an inappropriate designation as "industrial" and need to be rezoned. See attached map showing proposed rezone areas. The 2004 UGB expansion industrial lands need analysis was based on a combination of factors. These factors continue to be useful for future land need forecasts.

11 Industrial Land Forecasting Factors

Historical development trends

Availability of infrastructure and transportation access

Physical features that enable easy development; including infrastructure supply

Features that restrict or limit development – open space, natural resource protection

Location and proximity to labor force

Growth management goals and compliance with State law

Community employment needs, niche development, emerging markets

Complete neighborhood development techniques

Private or public ownership

Proximity to airport and glide path restrictions

The recent Benkendorf Report, as modified, other studies, and the recent UGB Expansion Report are the source of the current industrial inventory data. Modifications were completed using local and regional data and development trends combined with regional and statewide efforts to attract commerce and industry to the region. Thus, the forecasted land needs are a product of various technical sources in addition to the data listed above.

The appendix of this Plan shows that the bulk of serviceable and available industrial lands were essentially depleted as of 2004. The industrial inventory was replenished with the addition of 540 acres of industrial land in the UGB expansion approved by the State of Oregon in late 2004. This amount of land was thought to be more than adequate for at least the planning period, or 20 years. However, no amount of data or model can accurately predict the future economic land needs of a community or the exact amount of land needed in each category. Therefore, a variety of factors must be used to estimate the amount of developable land needed. Moreover, because it is not prudent to use absorption rates alone, the City has chosen to use the 11 forecasting factors described above. The result is an "estimate" of needed lands for the future beyond the recent UGB

[4] M37 is a measure approved by Oregon voters to protect property rights for those who have owned property prior to restrictive land use regulations that limit allowed uses of property. M37 is being re-examined and it is unknown whether the measure will be sustained over the years

expansion. These estimates are used as a basis for making land use decisions and as new data or new predictive models become available, the estimates will be revised.

Revisions to the Plan can occur at any time, once supporting evidence shows a need for a change or update. Thus, the community can be assured that careful monitoring of all predictive data will be the best method for addressing the economic land needs of the community.

The 11 forecasting factors can be used to formulate assumptions about economic trends and determine industrial land needs. These factors form assumptions and when combined with local planning and economic development goals, are intended to provide a foundation for assessing any changes in the Plan. As of the date of approval of this plan, the basic assumptions are as follows:

- The National, State and Local trend shows that the highest economic growth will be in Health, Retail, Service and Professional fields.

- The goals of the community and those of local economic development experts focus on high technology, manufacturing, and production as desired industries. These goals may conflict with the predicted trends.

- Public facilities that serve industrial lands must be complete and adequate to support community economic development goal. The most recent geological data shows the Deschutes Aquifer serves the industrial lands near the airport. This is in contrast to existing industrial sites (and other zones for that matter) located at lower elevations. Water supplies near the airport are more readily available and reliable than water sources at the center of the City.

- Lands that have appropriate infrastructure in place and are competitively priced will be easier to market to prospective developers. Lease-only lands are more difficult to market because of bank financing conditions.

- Industrial lands must be attractive and include support services and workforce housing for employees.

- The 2004 UGB expansion included lands specifically reserved for:
    1. Railroad, and/or railroad supportive uses
    2. Sewer Treatment Plant Expansion
    3. Large acreages for campus-like manufacturing or technical companies – publicly and privately owned

- Industrial lands that have historically supported lumber mills may need to redevelop in response to the economic changes and lack of raw timber supplies.

- Industrially designated lands near the core of the community will need to be reclassified to other zones to improve compatibility with abutting uses, encourage more mixed-use zoning, and to encourage innovative land use techniques that improve and broaden the labor pool. This conversion in combination with a need for additional industrial lands that are situated at the near the airport will require a future UGB expansion.

- Airport lands are a valuable industrial resource requiring special management, planning, and development techniques. The Airport Master Plan deals with the specifics of airport development.

- The 2003 revised Benkendorf Report provides valuable data that must be combined with other studies/data and the above 11 factors to accurately represent the land needs of the community.

- Industrial lands that contain natural resource areas and other areas that require special protection will reduce the overall inventory of developable industrial land.

The above assumptions can be combined to make certain quantitative determinations about needed industrial land supplies over the 20-year period. As previously mentioned above, the City had added 540 acres of industrial land to its inventories in 2004 as shown on Exhibit I-1. Each portion of added industrial land area was given a label and a 25-30% non-buildable factor was applied to the various acreages in each area. In addition, some of the lands were slated for specific development purposes, which were not speculative. The sewer treatment plant and the lands reserved for railroad uses are examples of non-speculative development proposals. The charts shown below give the acreage details for vacant and developable industrial lands.

Before UGB Expansion

Industrial Lands Available prior to UGB Expansion	Airport-publicly owned – lease only	Other- private and publicly owned
	305.0 acres	5.0 acres

After UGB Expansion

Industrial Lands Available after UGB Expansion	Airport-publicly owned – lease only	Other- private and publicly owned
	305.0 acres	824.0 acres

The Prineville community had very little privately owned, developable, industrial land available before the 2004 UGB expansion. After expansion, development activity/absorption, development restrictions, and reservation for special uses reduced the number of developable acres to the amounts shown below.

Reductions to Industrial Land Acreages after 2004 UGB Expansion

Area or Area Number	Total Acres Without Reduction	Developable Acres With Reduction
Airport	305.0	210.0
UGB Area 6	160.0	120.0
UGB Area 6a	80.0	36.0
UGB Area 6b	160.0	150.0
UGB Area 7	313.0	219.0±
UGB Area 8	77.0	0.0 – sewer treatment plant only
UGB Area 9	34.0	14.7 – reserved for railroad uses
Totals	824.0	750.0

Some of the above acreage reductions are estimates based upon average percentage of developable lands that contain constrained areas such as rock outcrops, steep slope, future ROW areas, buffer areas, public facility needs, airport glide paths, and other obstructions to development. Modern engineering techniques and other development strategies may be able to increase the actual and final amount of developable land.

Original Industrial Land Need Forecast

The Benkendorf Report utilized a combination of forecasting techniques based upon future population estimates and employees per acre data. The 2003 revisions to this report show that additional amounts of non-lease industrial land are required for the needs planning period in addition to other industrial land types. The City originally thought it took in more land than it needed for industrial purposes because of the assumptions made in 2003. The amount of 824.0 acres reduced to 750.0 acres was a result of incorporating the variety of City-preferred techniques and assumptions described above. For example: it was assumed that the railroad uses anticipated in UGB Expansion Area 9 will not develop as quickly as other industrial uses given historical demand. In addition, the development restrictions (lease only, etc,) for lands at the airport create an obstacle for certain types of desired development. Because the airport and railroad are long-term community features that will take many years (more than 20) to fully develop, these areas should be reserved and not included in the total net need for the purposes of this planning period.

Existing Industrial Lands Located Near Incompatible Uses

The City has also continued analysis of the potential negative impacts of retaining heavy manufacturing and other industrial land designations currently located near the older parts of the city. In-depth review of these areas indicates the industrial areas are located in areas with limited water supply, adjacent to sensitive wetlands, steep slopes, and long established low-density residential development.

Existing Residential Development on Industrial Lands

The City has numerous residential homes built on industrially zoned lands. This situation needs to be corrected. The City has proposed a legislative fix to this situation and in combination with UGB expansion will serve to correct long standing zoning errors. A demonstrated need for additional developable residential lands (as described in following chapters) and to develop within the guidelines of a "framework plan" supports the rezoning of poorly located industrial areas to other uses. Map # 3 shows these areas.

Additional Reductions to Industrial Land Acreages after 2004 UGB Expansion Due to Needed Rezonings*

Land Area By Historic Ownership Name, etc.	Total Current Industrial Acres Requiring Rezoning to Other Uses
Carpenter	100.0
Rhoden	120.0
Ochoco	120.0
Smith	60.0
Northridge	115.0
Other Areas	20.0
UGB Area 9	34.0
Totals	569.0[5]

**See Error and Potential Rezoning Map at Appendix.*

Properly Located Industrial Land

A future UGB expansion will add additional areas for industrial development near the airport and will help Prineville address the current jobs/housing imbalance. Redmond and Bend currently have a greater number of employment opportunities, which results in a significant number of Prineville's residents commuting to other cities on a daily basis. Such commutes have the effect of over utilizing limited energy and natural resources, creating unnecessary business expenses, and increased infrastructure costs for community.

Commuting has been found to reduce effectiveness of business operations due to increased employee travel time and increased absences related to weather and road conditions. Likewise, Prineville has lower housing prices, which attract employees who cannot afford to live in Bend or Redmond[6]. Additional supplies of appropriately located industrial land will help to provide quality jobs in the Prineville community thus, reducing the need for citizens to seek employment in other cities.

[5] *Acreages estimate until verified with GIS and survey data*

[6] *This is discussed further in the Housing section of the Plan.*

Current Industrial Land Prices – *Supply and Demand*

The price of industrial land near the airport has increased from $1.25 per square foot in 2004/05 to over $4.50 a square foot in 2006. The increase is a direct result of limited supply of available industrial land and the effect of land prices in Redmond and Bend which are over $9.00 per square foot. See attached Exhibit I-2.

Adding more industrial land to the UGB, in appropriate locations, will help to stabilize land costs and keep Prineville in top position with lower priced and larger sized lands ready for development.

The Baldwin Industrial Park and other newly developed industrial areas near the airport have experienced brisk development since the 2004 UGB expansion. This trend will continue and the proposed expansion of the UGB to add additional industrial lands near the airport, especially in an area with reliable water supply, will help broaden Prineville's ability to attract and maintain business.

Restricting the ability to expand the UGB to include more industrial land will have a harmful effect on Prineville's economy. The community needs to expand the UGB to remedy the loss of industrial land that should be rezoned to more appropriate uses. Thus, once the total amount of industrial land to be rezoned to other uses is removed from inventory and added to the previously identified need for a long-term supply of industrial lands the long term need now totals 1393 acres. This need in comparison to industrial land inventory shows that the UGB should be expanded to supply needed new industrial lands.

Industrial Land Need Post-2004 UGB Expansion

Industrial Acres Added to UGB In 2004 And As Reduced By Constraints	Identified Industrial Acres That Should be Rezoned to Other Uses	New Total Industrial Acreage Need
824.0 acres reduced to 750.0 acres	569.0	824.0 +569.0 = 1393.0 acres

Large Acreages Needed

The community supports targeting of specific industrial uses that can provide many jobs at one location. These industries tend to require large acreages from 50 to 120 acres to support large buildings in a "campus" arrangement. Good examples of such developments are Les Schwab, Lancair, call centers, truck stops, workforce housing/industrial developments, and airports. The

community intends to provide for and reserve large tracts for these types of development. The existing Enterprise Zone was created to entice large industrial developments to Prineville.

It is anticipated that there should be an inventory of large "for purchase" industrial lots appropriately located in industrial areas near the airport area. The City has determined that approximately 250 acres above the Benkendorf Report recommendation is appropriate. This allows for a variety of industrial development on the lands required for industrial development per the Benkendorf Report and related studies to provide for up to 5, 50-acre parcels, or combinations thereof, for large industrial development over the 20-year planning period. This is assumption is based upon local data and the demonstrated goal of targeting specific industries beyond the current trends. It is important to do this since the trend information does not necessarily reflect the needs of a growing community like Prineville, where supporting a broader range of employment and industrial choices to reduce historical jobs/housing imbalances is a community goal.

Estimated 20-year Industrial Land Absorption Over the Planning Period 2005-2025

Type of Industrial Lands	Years 2005-2010	Years 2010-2015	Years 2015-2020	Years 2020-2025	Total Acres*
Airport – Leased Only	Varies	Varies	Varies	Varies	210.0
Typical Industrial Lands	75 acres dev./year	50 acres dev./year	50 acres dev./year	50 acres dev./year	1125.0
Large Industrial Parcels	50 acres	50 acres	100 acres	50 acres	250.0
Railroad Lands	Varies	Varies	Varies	Varies	15.0
					1600

Industrial service, contractor operations, assembly, and repair businesses look to Prineville's available industrial lands for development opportunities. This trend has resulted in a vast amount of industrial development activity in Prineville over the past 5 years, which has continued through 2006.

This trend is expected to continue as commercial lands increase in cost and pressure to accommodate growth continues. It is appropriate to assume that industrial uses requiring less than 15 acres of land each will develop the quickest during the planning period. The evidence to support this conclusion includes the past historical data showing that industrial development has been occurring on parcels less than 15 acres in size. Development in Baldwin and Murphy Industrial Parks specifically focus their marketing efforts on attracting smaller industrial developments.

Existing/Proposed Industrial Opportunities- Industrial Land Site Requirements

The lack of easy to develop industrial lands in both Bend and Redmond will attract industrial uses to Prineville where land is plentiful and available at a competitive cost. Likewise, the demand for low cost developable residential land in Bend and Redmond will attract more people to Prineville where such lands are available and UGB expansion potentially supportable.

Both Bend and Redmond have had delays in getting their UGB expansion plans completed. This situation will encourage more people to locate homes and support businesses near or in Prineville. This eventuality is reflected in the table above where the first 5-year projection of typical industrial land absorption is estimated at 75 acres per year and then tapers off as Bend and Redmond resolve their inventory and UGB expansion issues.

The Prineville community needs additional industrial lands for the 20-year planning period as described above. The amount of land necessary to sustain the needs of planning period includes the acreages of those inappropriately located industrial lands that will be rezoned to mixed-uses as part of the Plan update mapping process. The programs listed below require regular review of the industrial lands inventory and recommend when and how future changes to industrial land inventories should be made.

Existing and Proposed Commercial Opportunities – Commercial Lands Site Requirements

The City of Prineville contains five commercial zones located throughout the community. The 2004 UGB expansion plan did not include additional commercial lands even though there is a demonstrated need for an additional 100 acres of commercial land within the UGB. This is because the opportunity to rezone and revitalize various areas with mixed-use development techniques will satisfy the need. Therefore, no additional commercial land is needed at the periphery of the community. New commercial lands will occur as a result of the following actions:

- Addition of new commercial lands abutting the Downtown Core Area
- Addition of commercial land to serve neighborhoods and employment areas
- Addition of commercial and rezoned industrial land along the existing strip to deepen existing commercial lots for redevelopment to support commercial "centers."

The City will need to encourage the additional of new commercial centers to areas near expanding residential areas and avoid lengthening the existing 3rd Street strip. This is sound land use planning and allows for flexibility to respond to market forces while recognizing that mixed-use planning and the "complete neighborhood" concept can meet the future economic development demand for any needed commercial development in the urban area.

The downtown core of the community is desired to be the focus of continued revitalization efforts. Several studies have been completed to provide guidelines for improved aesthetics and other development strategies intended to attract and retain businesses to the downtown area. However, this has been made difficult by the commercial "strip" that runs east-west along 3rd Street, also known as Highway 126 and Highway 26. Newer commercial stores have located along the strip and this has caused congestion by allowing direct access to the highway. The strip can also detract shoppers from the downtown area, which can create excess vehicle trips for citizens and reduce viability of the downtown core. Nonetheless, the newer franchises on the strip are desired commercial uses and help to address citizen needs for goods and services.

The opportunity for "center-type" rather than "strip" development is possible if the anticipated commercial rezonings occur over time. A new technique that builds on an old concept -"Main Street" type development, is a successful land use technique that can correct and improve commercial vitality by encouraging pedestrian access. "Main Street" development techniques provide for a more walkable shopping experience without excessive vehicle trips. The storefronts face a local access street that is perpendicular to the primary access street Revisions to the development codes may be required to enable this development technique.

The 2004 UGB expansion took in additional new residential and industrial lands. The local topography necessitates that these new areas project "out" from the urban core to avoid steep rimrock and other topographical obstacles. The result is that the City, as a whole, is forced to grow in a less-than-compact form. However, the development pattern *within* the new areas can be compact and designed to serve as many citizen needs as possible. This means that mixed-uses, including convenience commercial service centers, open space, and some employment areas will be required to develop in new neighborhoods so as to reduce vehicle miles traveled and improve efficiency for all residents. The community will benefit from adding small commercial areas to new and revitalized neighborhoods as the community grows. Citizens have expressed a need for additional neighborhood and local shopping opportunities that do not require excessive vehicle trips or vehicle trips to other communities.

Commercial Land Inventory Needs Analysis

The City conducted various inventory and land need analyses. The Benkendorf Report as revised states that approximately 100 acres of additional commercial land should be added to the existing commercial inventory. The original Benkendorf study advised that only 80 acres would be needed and this should be allocated to supply only two, 40-acre parcels for large "big-box" development.

There is a significant obstacle with the original Benkendorf recommendation. Big-box stores typify strip development unless they are located in centers or mixed-use areas. In addition, the community would not benefit from applying new commercial designations to only two areas of the community. This is because the community has diverse commercial needs and supports new commercial lands to be strategically placed throughout the community. Efforts to deepen the commercial designations in the downtown core and rezone redevelopment lands in other areas are a higher priority than only focusing on big-box development in a few areas.

Moreover, it is necessary to recognize that the Prineville community is made up of various neighborhoods separated by topography or other barriers. Some of these neighborhoods are located in areas that are not served with adequate commercial services. The broadly applied mixed-use and/ or improved land use development practices advocated in other parts of this Plan could not be achieved if the new commercial lands were limited to just two areas.

It could be detrimental to the community to limit new commercial areas to just two large businesses and not allow other areas to redevelop or respond to certain market forces in combination with mixed-use development techniques. Thus, Prineville's economy will be benefited by being flexible with the placement of new commercial land needs over the 20-year period rather than restrict itself to 2 parcels limited to big-box developers.

The commercial inventory data below is derived from the Benkendorf Report, as revised.

Existing Developed Commercial Lands in the Prineville Urban Area

Zone	Code	Parcels within the UGB					
		Vacant Acreage	# of Parcels	Non-Vacant (Developed) Acreage	# of Parcels	Total Acreage	# of Parcels
Central Commercial	C-1	5.10	29	53.10	258	58.20	287
General Commercial	C-2	13.05	10	121.15	198	134.20	208
Professional Commercial	C-3	0.0	0	5.70	30	5.70	30
Neighborhood Commercial	C-4	-	-	-	-	-	-
Recreation Commercial	C-5	0.0	0	2.70	3	2.70	3
Total Commercial - City		**18.15**	**39**	**182.65**	**489**	**200.80**	**528**

Commercial Land Need by Development Type, Prineville Urban Area

	Unadjusted Net Buildable Acreage Needed	Unadjusted Gross Buildable Acreage Needed	Additional Gross Acreage Needed	Total Adjusted Gross Buildable Acreage Needed	Net Buildable Acreage Available	Gross Buildable Acreage Available	2023 Net Need (or Surplus) - Gross Acreage
Commercial - non-lease only	112.8	141.0	**100.0**	221.0	33.57	41.9	199.1
Commercial - lease-only - Airport	12.5	15.6	0.0	15.6	18.8	23.5	(7.9)

The above tables include land within the airport facility that permits commercial uses. This public land is lease-only and not as desirable as private land that can be purchased. This is due to the financing difficulties presented by lease-only land and the development restrictions in place at the Prineville Airport.

It should be noted that the primary growth industry and target areas described earlier in this chapter also apply to the commercial analysis. Again, as the trend information suggests, the primary growth sectors will be health care and commercial activities, particularly service, and retail. The EDCO target areas are mostly industrial but could have a retail/commercial component that would be a secondary use to the primary industrial development.

Existing and Proposed Commercial Opportunities – Commercial Lands Site Requirements Conclusion

The community is poised to respond to the need for additional commercial designations. The current UGB contains adequate lands upon which to develop needed commercial uses as long as the needed rezonings are timely and planned to respond to mixed-use and other development techniques that can enhance the urban community. Performance standards and the planned unit development (PUD) section of the implementing land use ordinances can help provide for a more integrated and balanced development pattern, particularly with new commercial areas. For now, the 100 acre commercial land need should be a starting point and not a limiting factor, especially if there is a demonstrated public need and benefit for additional commercial lands beyond the City recommendation. Thus, the City has developed a firm position that UGB expansion is not needed for adding lands solely for commercial development. Rather, new commercial areas should be the product of rezoning existing lands with in the current UGB and/or when necessary to support mixed-use development strategies.

Goal # 1: Provide adequate industrial and commercial land inventories to satisfy the urban development needs of Prineville for at least the 20 year planning horizon.

Economic Values and Policies

- Updates to inventories and analysis of needed industrial and commercial land types, existing land supplies, and economic development strategies for meeting the requirements of the community are essential. It is necessary to provide adequate buildable industrial and commercial land for at least 20 years.

- Updates to the inventories may be required in response to redevelopment, proposed zone changes, mixed-use development techniques and planned unit developments that enable "complete neighborhood" concepts and economic development opportunities.

- State, local, and nationwide trends are not adequate to properly estimate needed industrial and commercial lands. Other local information and economic development targeting goals must be used to properly evaluate future land needs.

- Adequate public facilities must be planned, funded, and installed to serve industrial sites and commercial areas.

- Preservation of large industrial parcels over 20 acres in size will attract target industries and new manufacturing businesses.

- Preservation of lands for workforce housing will also attract target industries.

- Urban reserve planning will be needed to project growth beyond the 20-year period imposed by the State of Oregon.

- Additional land is needed to support commercial and industrial uses. Where there are particular locational requirements for certain activities, amendments to the Comprehensive Plan may be necessary. Amendments should be evaluated in relation to all applicable policies of the Comprehensive Plan.

Programs:

The City shall:

1. Regularly monitor and analyze commercial and industrial land inventories. When new lands are needed, the City Council shall authorize expansion of the UGB or other methods to ensure that at least a 20-year inventory of land for each category is available within the urban area.

2. Update and manage all public facilities planning to meet community and economic development goals while encouraging additional public and private investment in the community.

3. Explore and initiate methods for preserving large industrial parcels to meet projected demand.

4. Complete urban reserve planning consistent with the other provisions previously listed in this Plan. See attached Urban Reserve Area Map No. 4

5. Any correction amendments and needed legislative changes for rezoning shall be processed immediately upon City Council directive.

6. Develop a community entrance plan that fosters improved aesthetic treatments and buffering along the western entrances to the community.

Goal # 2: Develop an "Economic Development Strategic Plan" and other mechanisms necessary for supporting and enhancing the local economy.

Economic Values and Policies

- Successful economic development strategies require cooperation with a variety of agencies and other groups to develop a plan that best meets the requirements of a growing community.

- Successful economic opportunities rely upon the communities' ability to support and connect various elements of the economic development into an integrated framework.

- Promoting an entrepreneurial climate for existing and new businesses is a key factor in strategic planning.

- Providing a strong public partnership with local businesses is key to successful economic development.

- Ensuring a high quality of life and the small town atmosphere is essential to addressing citizen concerns about growth and economic development.

- SDC charges must be carefully monitored and evaluated to ensure that development pays its own way while not creating obstacles to desired development.

- The adoption and implementation of a Downtown Enhancement Plan will help to ensure the long-term success of the urban core area.

- The State of Oregon transportation system (ODOT) has a significant effect upon the local community. Local groups and City decisions makers will need to establish good working relationships with ODOT to ensure coordination and quality development.

Programs:

The City shall:

1. Organize and staff an economic development committee whose purpose is to monitor and recommend needed changes to the City economic opportunities analysis and develop an "Economic Development Strategic Plan." The committee shall include three members of the City Council, 2 members of the Planning Commission, and two ad hoc members of the community experienced in economic development and any staff members deemed appropriate by the City Manager.

2. Continue to refine which commercial and industrial activities are lacking in the community. The City shall identify needed commercial and industrial areas on an overlay map. The overlay map is a general framework plan that represents where certain areas of the community could benefit from additional commercial or industrial designations.

3. Develop strategies to capture the opportunities of a technology and knowledge-based economy.

4. Modify the land use development codes to better address economic development objectives and encourage appropriate mixed-uses in commercial and industrial zones.

5. Update and monitor the SDC methodology to assure appropriate charges to new development.

6. Adopt a Downtown Plan that includes a long-term strategy for enhancing development opportunities in the urban core and creates a "sense of place" for local residents and visitors alike.

Purpose and Intent

Transportation System Plans (TSP) are developed per Oregon Transportation Planning Rule (TPR) (OAR 660-012) and must be consistent with existing regional, state, county, and local plans, policies, and documents including the Oregon Highway Plan, the ODOT 2020 Transportation System Plan Guidelines, and the Prineville Comprehensive Plan (adopted in 2007 and amended as recently as 2024). The TPR implements Statewide Planning Goal 12. Transportation, that promotes the development of safe, convenient, and economic transportation systems designed to maximize the benefit of investment and reduce reliance on automobiles.

Statewide Planning Goal 12, Transportation provides a framework for local jurisdictions to create a transportation system plan that considers all modes of transportation, including transit, automobiles, air, rail, bicycles and pedestrians.

The 2025 City of Prineville Transportation System Plan (TSP), adopted here by reference; establishes the city's projects, policies, and objectives designed to fulfill Prineville's transportation needs. The development and prioritization of these projects was driven by development, review of prior planning efforts and analyzing existing needs and future conditions. Public involvement from Prineville residents also played a key role in shaping projects and determining what priorities to take when addressing the multitude of needs in the city.

The Prineville TSP considers all the land within the city limits and the Prineville urban growth boundary (UGB). The TSP serves as a 20-year plan to guide transportation improvements and enhance overall mobility for vehicles, pedestrians, and bicyclists throughout the city. This Chapter list the goals found in the TSP and identifies specific City policies. The implementation measures for these goals and policies is found within the City's Land Development Code, and the City's Specifications & Standards Manual.

Goals

The 2025 TSP includes updated goals, objectives, and evaluation criteria that reflect local transportation needs that have emerged since the last TSP update in 2013. The 2025 TSP update includes fewer goals and objectives to streamline implementation and better identify the critical priorities for the transportation system.

Goal #1: Ensure a safe, efficient, and accessible transportation system for all users.

Goal #2: Build a complete system of walking and cycling routes that connect neighborhoods to schools, parks, jobs, and other key places.

Goal #3: Build and maintain the transportation system to support economic development in the region.

Goal #4: Improve system performance by balancing mobility and access along main travel routes, including on state highways.

Goal #5: Minimize the impacts of the transportation system on the natural and built environments.

Policies

Street Network

The foundation of the Prineville transportation system is a product of the existing roads and highways that cross the community. The City has a hierarchical roadway system as follows:

Roadways are classified using arterial, collector, and local designations depending on the intended function and the adjacent land use needs. Figure 15 in the TSP shows the functional classification of each roadway in Prineville. Figure 16 in the TSP shows the functional classification of existing and future. The map also includes "vision" projects that are not part of the TSP but are acknowledged for future consideration.

Major Arterials primarily provide mobility particularly between large population centers or activity generators. Mobility is emphasized over local access connections. Within Prineville, all major arterials are ODOT facilities. U.S. 26 and OR 126 are examples of major arterial facilities. Their main functions are to provide east-west connection through town as well as to connect Prineville with nearby communities.

Minor Arterials are also intended to serve mobility needs over access needs in town. However, minor arterials provide important connections through town rather than connecting Prineville to other communities. Main Street is an example of a minor arterial in Prineville. Its main purpose is to connect the north and south areas of Prineville.

Major Collectors provide connection between local streets and the arterial street system. Trip lengths are generally shorter on collectors. Collectors provide a link between local traffic generators and more regional facilities. An example of a major collector in Prineville is NE 2nd Street. NE 2nd Street's primary function is to connect residential and commercial areas with Main St. and U.S. 26.

Minor Collectors are similar to major collectors in their purpose of linking local and regional traffic facilities. However, minor collectors typically provide access to and circulation within neighborhoods, industrial areas and commercial areas. SE 5th Street is an example of a minor collector. It connects all residences in the area to other commercial, residential or public areas.

Local Streets provide direct access to land. Shorter trips are common, and through-trips are discouraged. Travel is generally at lower speeds than on other road classifications. Prineville's local streets generally connect to collectors. Roadways that are not labeled as collector or arterial streets on Figure 15 are designated as local streets.

General Transportation Street Network Policies	
1.	The City will improve the transportation system in accordance with the Standards and Specifications Manual for all people and all modes of travel, including those that do not rely on single occupant vehicles.
2.	Promote and enhance the livability of the community, preserve valuable resources, and provide more transportation choices.
3.	Ensure a well-connected and redundant transportation network to facilitate emergency services and evacuation during emergencies.
4.	Require new developments to include an analysis of transportation impacts, needs, and mitigation options. When warranted, Require that development projects provide a Transportation Impact Analysis or Transportation Impact Letter analyzing project conditions in order to minimize impacts and protect transportation facilities.
5.	Ensure the transportation system supports economic development and facilitates deliveries of goods and services. This includes considerations for overnight truck parking in appropriate locations in or outside the City.
6.	Collaborate with people living and working in Prineville, state agencies, Crook County, transit service providers, local business interests, special interest groups, and tourism professionals on transportation system decision making.
7.	Promote traffic calming measures in core commercial areas and residential neighborhoods to reduce vehicular speeds on roadways and create a safe pedestrian/bicycle environment.
8.	Provide sidewalks, trails, open spaces, connections between open space, bike lanes, transit amenities, and pedestrian amenities to encourage transportation choices and promote a high level of livability.
9.	Implement planned new roadways, connections, and other TSP improvements as part of new development.
10.	Develop an approach to funding necessary transportation improvements over the life of the TSP.
11.	Allow for the development of private streets systems, where appropriate and where they are guaranteed to be maintained by parties other than the City, to reduce the overall funding need for street maintenance and the need to seek additional tax revenues.
12.	Promote transportation demand management (TDM) strategies to reduce vehicle miles traveled (VMT) on the transportation system.
13.	A safe transportation system, particularly for pedestrians, shall be reviewed as part of any development or transportation infrastructure project. This includes impacts to low-income residents, minority populations, elderly populations, youth, and people living with disabilities when implementing transportation infrastructure projects.
14.	Provide opportunities for street trees, pedestrian amenities, separated sidewalks, curb extensions, traffic calming, and other related devices.
15.	Consider Innovative intersection designs such as roundabouts to reduce costs, traffic congestion, and concerns related to safety and accessibility.
16.	Monitor and update street functional classifications as necessary to sustain the expected growth of the community and meet applicable Transportation Planning Rule (TPR) objectives.
17.	The City and State should consider interim solutions for large long-term projects that take multiple years to fund and implement.

Active Transportation System

A well-connected and -maintained active transportation system enables safe and convenient travel by foot, bicycle, or other active mode of transportation between neighborhoods, retail centers, employment areas and transit stops. The active transportation network is composed of sidewalks, roadway crossings, bicycle lanes, multiuse trails, and neighborhood greenways. Existing active transportation conditions are described in section 2.4 of the TSP, with locations shown in Figure 9 of the TSP.

Active Transportation Policies
1. Encourage pedestrian and bicycle travel with separated facilities as a safe, feasible alternative to the automobile
2. Require that all proposed subdivisions include bicycle and pedestrian paths and encourage paths accessing open space and parks.
3. Ensure that bicycle and pedestrian paths are well lit and provide visual surveillance from the street.
4. Prioritize paths along existing and proposed major and minor arterials as the preferred approach to accommodate bicycle and pedestrian paths.
5. Require all commercial, office, and multifamily development to provide safe and convenient off-street bicycle parking space and routes in their design.
6. Provide curb ramps at all corners, intersections, or locations where bicycle and pedestrian routes and paths intersect with streets.
7. Promote pedestrian and bicycle connections along existing waterways, utility rights-of-way, and properties that wish to be annexed to the city.
8. Improve signs, markings, wayfinding, and safety features on existing bicycle and pedestrian paths.

Public Transportation System

Transit within Prineville includes fixed-route and Dial-A-Ride service provided by Cascades East Transit (CET) and shuttle service provided by Grant County People Mover.

For fixed route transit, Cascades East Transit operates Community Connector fixed routes that connect to communities within Crook County, Deschutes County, and Jefferson County. CET operates Route 26 service between Redmond and Prineville. This service is open to the public and operates Monday through Friday. Weekend service is not currently provided. The annual ridership from Route 26 in 2017 was 16,067. Route 26 has a moderately strong ridership and productivity compared to other CET routes. CET has suspended fare collection until further notice on all CET services except recreation services.

Cascades East Transit offers a Rural Dial-A-Ride within Prineville. This service is open to the public and does not have eligibility requirements. Riders must call the day before service is needed to reserve a ride. Ride times are scheduled based on availability. The travel patterns from 2018 in Prineville include the Stryker Park bus stop as a key location since passengers can transfer to CET Route 26 and the Prineville Senior Center.

There are other public transportation services offered within the CET service area that are provided by other operators independent of CET services. The other transit provider that connects with the CET network is People Mover in Grant County, a shuttle service that provides connections to several Central Oregon communities. There are two Catch-A-Ride services offered: Monument to Bend and Prairie City to Bend. The transit services allow for statewide travel and are located within 0.25 to 0.5 miles of one or more CET bus stops.

Public Transportation Policies
1. Assess the possibility of a local circulator bus serving Prineville's major employers and destinations.
2. Encourage private inter- and intra-city transit to supplement existing Transit service
3. Develop accessible transit stops to facilitate to enable better mobility and access for people with disabilities and seniors.
4. Ensure the road network can sufficiently accommodate buses and other transit vehicles.

Freight & Rail

To serve industrial properties and support future economic development efforts, the City of Prineville has designated several roadways as local Truck Routes, including NW 3rd Street/U.S. 26, S Main Street, NW Lamonta Road, NW 9th Street, NW 10th Street, NW Gardner Road, NE Laughlin Road, SE Combs Flat Road, SW George Millican Road, and all highways entering town. Peter Road extension West is in question based on existing industrial zoning patterns that may change. The designation of these facilities as Truck Routes does not prohibit local delivery trucks from using other roadways, but is intended to encourage the use of these routes for regional freight needs through design and signage. Currently, most trucks travel on U.S. 26 and OR 126. Truck volumes comprise between 11% and 26% of the overall traffic volumes on Prineville's truck routes.

Formed in 1918, COPR directly serves industries in Crook County. The 18-mile City of Prineville Railway (COPR) short line service provides a primary freight connection between Prineville and the Burlington Northern Santa Fe and the Union Pacific Railroads at Prineville Junction three miles north of Redmond along the U.S. 97 corridor. The city's freight depot, constructed in 2010, lies in between U.S. 26 and NW Lamonta Road and provides multiple services, including intermodal transfers between trucks and the short line service, fostering freight rail links to destinations within the state and across the country.

The City increased its investment in the COPR short line service to Prineville Junction in 2010 and built a freight depot with assistance from Connect Oregon grants. The freight depot provides warehousing space, equipment ramps, freight-to-rail intermodal service, and bulk product storage. The freight depot's goal is to provide the Central Oregon region with these services and provide a regional multimodal transportation hub with links to destinations within the state and across the country. It is a more than 30-acre site along Bus Evans Road between Lamonta Road and U.S. 26, 3 miles west of the city and adjacent to the COPR mainline.

The location of this site and its intermodal infrastructure further justifies the City freight route designation of Lamonta Road. Coordination with Crook County should be pursued to similarly classify the portion of Lamonta Road located outside the city limits.

Freight and Rail Policies	
1.	Ensure that transportation system improvements are compatible with the Prineville Railroad and its facilities, including road construction, crossings, and bicycle and pedestrian improvements.
2.	Promote the value of the railroad and its transport capabilities to industries seeking to locate in Prineville.
3.	Monitor demand for goods transport by rail and prepare to take advantage of new opportunities.
4.	When railroad rights-of-way are considered for abandonment or vacation, promote the preservation of these corridors for other transportation services.

Aviation

Prineville is home to Prineville Airport, owned and managed by Crook County. The airport has two runways and is used primarily for general aviation by private individuals, corporations, the U.S. Forest Service, and the Bureau of Land Management. A Master Plan update for the airport was completed in 2017 and calls for expansions to the runway and taxi areas, but the expansion is not expected to significantly impact surface traffic. The airport currently generates low vehicle traffic volumes, and these are anticipated to continue in the future. No aviation improvements are recommended for the 2025 TSP update beyond those described in the Airport Master Plan.

Aviation Policies

1. Continue to jointly monitor and manage the airport facility to ensure maximum service to users, safety, enhancements to economic development, and adherence to FAA requirements.
2. Continue to adhere to the Airport Master Plan as a planning tool. Any significant modifications of the plan must be publicly examined through the land use process and be approved by City and County.
3. Continue to examine and evaluate UGB expansion on the west side of the airport to facilitate airport expansion and/or new industrial zones as a compatible use and buffer to airport activities.

Street Capacity and Service Level

Prineville's transportation system serves people driving, biking and walking to destinations in Prineville and enables connectivity out of the city. As the city has steadily grown in population, the number of travelers has increased in kind, spurring a need for solutions to ensure the system can sustainably accommodate future traffic and meet goals for safety and access.

Street Capacity and Service Level Policies

1. Meet applicable City, County, and/or State operational performance measures or identify alternative measures as appropriate in balancing other City goals and needs. The City may accept higher levels of congestion in some locations or corridors where it is impractical or costly to improve capacity.
2. Ensure connectivity of streets and pedestrian and bicycle facilities between neighborhoods and key community destinations such as schools and high traffic areas. These connections help reduce unnecessary traffic on higher order streets and corresponding intersections.
3. Reduce crashes in Prineville, particularly higher severity injury and fatal crashes, and those involving more vulnerable roadway users such as pedestrians and bicyclists.
4. Increase service level and reduce maintenance cost by maintaining at least a "good" pavement condition index (PCI).

Land Use and Transportation Connections

Most residential zones, public services, and the main commercial corridor— 3rd Street/U.S. 26—are located in the Ochoco Valley, while the Tom McCall area is home to the Prineville airport and industrial uses. In the past decade, Prineville has seen substantial growth of data storage facilities and other industrial uses in the Tom McCall area that have been a major driver of economic growth. New residential and industrial growth in Prineville is expected to continue over the 20-year horizon of the city's Comprehensive Plan and will influence the city's transportation needs.

Land Use and Transportation Connection Policies

1. Choose transportation investments that avoid displacing homes and businesses and that maintain Prineville's small-town character.
2. Growth should pay its own way without community subsidy.
3. Evaluate new projects to determine the impact of development upon the transportation system using the most recent edition of the Institute of Traffic Engineers (ITE) manual or alternative source as necessary.
4. Transportation impact shall be studied by the developer through a traffic impact analysis (TIA). The City shall evaluate and determine acceptable mitigation prior to issuance of any development permit.
5. Transportation mitigation costs may be refunded for transportation improvements, cash contributions, right of way dedications, transfer of development credits and development rights, real property and other significant contributions as the City sees fit to accept.
6. Monitor and revise SDC methodology as necessary to establish fees and reimbursement programs for individuals and entities that construct TSP master planned transportation improvements.

Sustainable Funding

The Prineville TSP contains projects that may be implemented on a short-, medium-, or long-term basis. Project prioritization includes factors such as community desire, available funding, staff capacity, and City leadership support. As limited funding exists, some projects may take years, if not decades, to complete. Over time, projects not included in this TSP may be added to address new needs that arise as Prineville's population continues to change. Chapter 5 of the TSP reviews funding forecasts and options.

Sustainable Funding Policies
1. Identify transportation alternatives that meet economic development, safety, and capacity needs at the lowest cost and maximize facilities' lifespan.
2. Seek a variety of funding sources for transportation improvements, maintenance, and preservation, such as state and federal grants, levies, increased taxes, bonds, and other sources.
3. Promote transportation demand management strategies (carpooling, flexible work hours, telecommuting, etc.) to reduce VMT on the transportation system.
4. Review and evaluate TSP projects at least every five years to ensure planned improvements continue to be aligned with the City's priorities for the transportation system.
5. The City shall review SDC fees annually to assure revenue collected is adequate to pay for the identified improvements. Annual adjustments shall be made to SDC's to cover the costs associated with quantified inflation rate

Chapter 7 Housing

Purpose and Intent

The purpose of this chapter is to ensure the provision of appropriate types and amounts of land within urban growth boundary supporting a range of housing types necessary to meet current and future needs. These lands should support suitable housing for all income levels. Likewise, the Plan must also ensure that the appropriate type, location and phasing of public facilities and services are sufficient to support housing development in areas presently developed or undergoing development, or redevelopment.

This Chapter includes three supporting documents: (1) A Buildable Lands Inventory produced by Angelo Planning Group dated May 2, 2019; (2) A Housing Need Analysis produced by Johnson Economics dated June, 2019; and (3) A Housing Strategies Report produced by Angelo Planning Group dated June 10, 2019. These documents are the sources of information found in this Chapter and provide additional information for reference.

Introduction

Having affordable, quality housing in safe neighborhoods with access to community services is essential for all Oregonians. Like other cities in Oregon, the City of Prineville is responsible for helping to ensure that its residents have access to a variety of housing types that meet the housing needs of households and residents of all incomes, ages and specific needs. The City does this primarily by regulating residential land uses within the City, and working with and supporting non-profit and market rate developers, and other housing agencies in developing needed housing.

In addition, the City has undertaken and will continue to implement and update a variety of activities to meet current and future housing needs:

- Conduct and periodically update an analysis of current and future housing conditions and needs. The City most recently conducted this analysis in 2019. The results are summarized in this element of the Comprehensive Plan and described in more detail in a supporting Housing and Residential Land Need Assessment Report.
- Conduct and periodically update an inventory of buildable residential land (BLI) to ensure that the City has an adequate supply of land zoned for residential use to meet projected future needs. The City most recently conducted this analysis in 2019. The results are summarized in this element of the Comprehensive Plan and described in more detail in a supporting Buildable Lands Inventory Report.
- Adopt and amend, as needed, a set of housing-related Comprehensive Plan policies to address future housing needs.
- Regularly update and apply regulations in the City's Zoning and Land Division Ordinances to meet a variety of housing needs identified in the Comprehensive Plan and supporting documents.
- Implement additional strategies to address housing needs in partnership with state and county agencies and other housing organizations. Potential strategies are described in more detail in section 4 of the Housing Strategies Report prepared as part of the Housing Needs Analysis in 2019.

Demographic Conditions and Trends

Unless otherwise noted, the flowing discussion refers to the Prineville Urban Growth Boundary (UGB) area, not the city limits.

- Prineville is a City of an estimated 10,000 people within its City limits, (11,910 people within the UGB), located in Crook County in Central Oregon. An estimated 19% of the population in the UGB lives outside the city limits.
- Prineville has experienced steady growth, growing over 36% in population since 2000. In contrast, Crook County and the state experienced population growth of 15% and 21% respectively. (US Census and PSU Population Research Center)
- The Prineville UGB was home to an estimated 5,218 households in 2018, an increase of roughly 1,850 households since 2000. The percentage of families fell between 2000 and 2018 from 67% to 53% of all households. The city has a smaller share of family households than Crook County (65%) and the state (63%).
- Prineville's estimated average household size is 2.26 persons, having also fallen since 2000. This is lower than the Crook County average of 2.31 and the statewide average of 2.47.

FIGURE 1.1: PRINEVILLE DEMOGRAPHIC PROFILE (UGB)

POPULATION, HOUSEHOLDS, FAMILIES, AND YEAR-ROUND HOUSING UNITS

1 From PSU Population Research Center, Population Forecast Program, final forecast for Crook Co. (2017)

[2] 2018 Households = (2018 population - Group Quarters Population)/2018 HH Size

[3] Ratio of 2018 Families to total HH is based on 2016 ACS 5-year Estimates

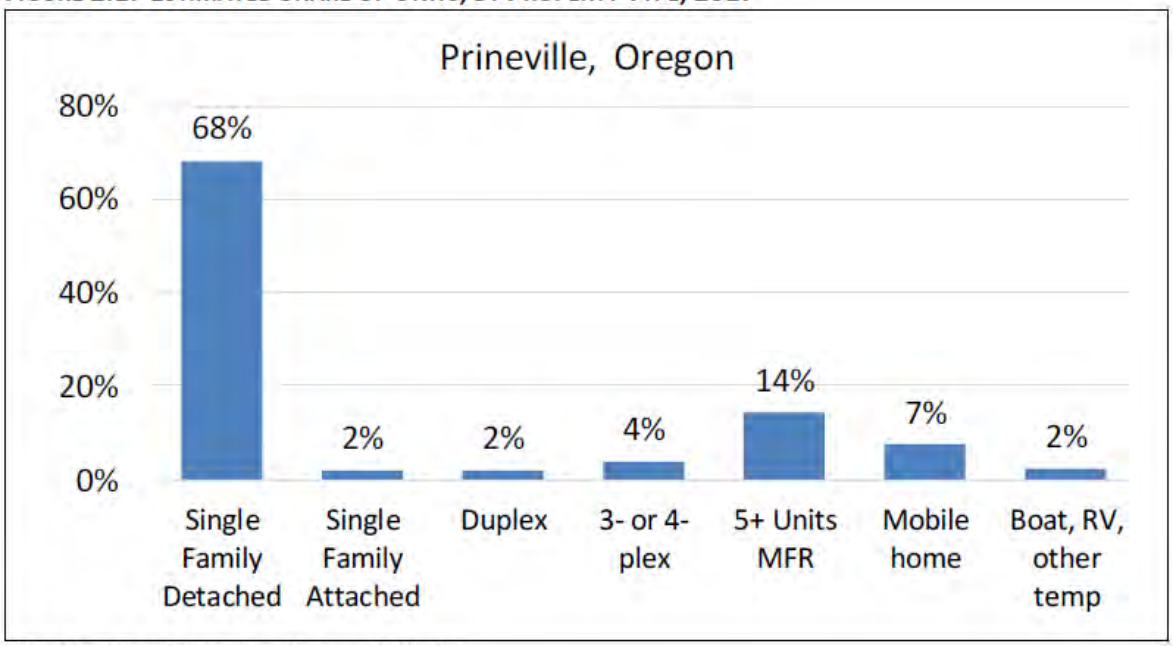
[4] 2018 housing units are the '10 Census total plus new units permitted from '10 through '18 (source: Census, Cities)

[5] Ratio of 2018 Group Quarters Population to Total Population is kept constant from 2010.

Housing Conditions and Trends

- **Housing Tenure.** Prineville has a greater share of owner households (55%) than renter households (45%) according to the Census. The ownership rate in Prineville has fallen significantly from 63% since 2000. During this period the statewide rate fell from 64% to 61%. Nationally, the homeownership rate has nearly reached the historical average of 65%, after the rate climbed from the late 1990's to 2004 (69%). The estimated ownership rate is higher in Crook County (67%) and statewide (61%).
- **Housing Stock.** The Prineville UGB had an estimated 5,300 housing units in 2018, with a very low estimated vacancy rate (includes ownership and rental units). Figure 2.1 shows the estimated number of units by type in 2017. Detached single-family homes represent an estimated 68% of housing units (includes manufactured homes on a single-family lot). Units in larger apartment complexes of 5 or more units represent 14% of units, and other types of attached homes represent an additional 8% of units. (Attached single family generally includes townhomes, some condo flats, and plexes which are separately metered.) Mobile homes (in parks) represent 7% of the inventory.

FIGURE 2.1: ESTIMATED SHARE OF UNITS, BY PROPERTY TYPE, 2017



SOURCE: City of Prineville, Census ACS 2017

Current and Projected Housing Needs

- The results show a need for 1,020 new housing units by 2039.
- Of the new units needed, roughly 57% are projected to be ownership units, while 43% are projected to be rental units. This is due to the forecast of a slightly higher homeownership rate in the future.
- The table shows no new need for ownership housing at the low-end of the pricing spectrum, but in the middle. This is because these are the value levels where a majority of the city's housing is currently found. Therefore, what Figure 4.3 represents is that there may be support for some units at higher price points.
- The greatest need for rental units is found at the lowest and middle price points. There is support for some units in the $900 to $1,100 rent levels, which is above most current market rents. This shows that there is some support for new, more expensive rental supply. There is also a need for some single-family homes for rent at higher price points.

FIGURE 3.4: PROFILE OF CURRENT HOUSING SUPPLY, ESTIMATED AFFORDABILITY (2018)

- Figure 4.4 presents estimates of need at key low-income affordability levels in 2018 and in 2039. There is existing and on-going need at these levels, based on income levels specified by Oregon Housing and Community Services for Crook County. An estimated 55% of households qualify as at least "low income" or lower on the income scale, while 17% of household qualify as "extremely low income". Typically, only rent-subsidized properties can accommodate these households at "affordable" housing cost levels.

FIGURE 4.4: PROJECTED NEED FOR HOUSING AFFORDABLE AT LOW INCOME LEVELS, PRINEVILLE

Affordablilty Level	Income Level		Current Need (2018)		Future Need (2039)		NEW Need (20-Year)	
			# of HH	% of All	# of HH	% of All	# of HH	% of All
Extremely Low Inc.	30% AMI	$16,410	862	17%	993	17%	131	13%
Very Low Income	50% AMI	$27,350	1,811	35%	2,086	35%	275	27%
Low Income	80% AMI	$43,760	2,876	55%	3,313	55%	437	43%

* Income levels are based on OHCS guidelines for a family of four.

Comparison of Projected Need and Buildable Land Supply

- There is a total forecasted need for 1,021 units over the next 20 years. This is well below the estimated capacity of over 10,000 units. As Figure 5.3 below demonstrates, there is sufficient capacity to accommodate all projected new unit types. After this need is accommodated, there is an estimated remaining capacity of over 1,900 additional units, mostly in the medium-density residential zone.
- The following table shows the same comparison, converting the forecasted residential need and capacity by acres, rather than units. There is a projected need for 216 acres of new residential development, but a buildable capacity of 1,569 acres.
- There is currently sufficient buildable capacity within Prineville to accommodate projected need. Some of this capacity is in the form of parcels with the potential for infill or redevelopment for future multi-family units. The character of this supply can help guide housing policy and strategy recommendations to be included in subsequent reports and ultimately integrated in the City's updated Comprehensive Plan.

FIGURE 5.1: ESTIMATED BUILDABLE LANDS CAPACITY BY ACREAGE AND NO. OF UNITS (2019)

ZONE	Buildable Acreage				Projected Unit/ Net Acre	Housing Unit Capacity			
	Partially Vacant	Vacant	Total	Share		Partially Vacant	Vacant	Total	Share

For more detail on these findings please refer to the "Housing and Residential Land Needs Assessment Report" and the Buildable Lands Inventory (BLI) maps prepared for the city.

Potential Strategies to Accommodate Future Housing Needs

The Housing Needs Analysis and Buildable Lands Inventory conducted for the City in 2019 indicated that the City had and adequate supply of buildable residential land within its urban growth boundary (UGB) to meet projected housing needs during the next 20 years. If population growth occurs at a faster rate than projected at that time, the City could find that additional land is needed in the future.

Although the City is not anticipated to need to expand its UGB during the planning period, it can continue to consider and implement a variety of strategies in the future to further provide opportunities for a wide range of housing choices, efficient land use, and development of housing affordable to people with low and moderate incomes. For the purposes of this Plan, "affordable housing" is defined as housing that is affordable to a household that spends 30% or less of its income on housing, including rent or mortgage payments. Households with low incomes are those who make 80% or less of median household income. Those with moderate incomes make 81-95% of median household income.

The City is already implementing a variety of land use and other strategies that help provide for a wide range of housing options in Prineville. Potential strategies not currently being undertaken by the City, or existing strategies with the potential to be strengthened or enhanced, are described in more detail in the Housing Strategies Report prepared by the City as part of its Housing Needs Analysis project in 2019.

Housing Goal: Provide opportunities for a wide range of housing types that meet the needs of residents with a full range of incomes and circumstances.

Policies

1. The City shall apply zoning designations and standards that create opportunities for wide variety of housing types, including but not limited to single-family detached homes, manufactured homes, duplexes, triplexes, four-plexes, townhomes, apartments, accessory dwelling units, cottage cluster housing, recreational vehicle parks, and mixed commercial and residential use.

2. The City shall encourage development of higher density and multifamily housing in close proximity to services and major transportation corridors or other areas designated for this use and limit low-density housing in these locations.

3. The City shall seek partnerships with non-profit housing developers and other agencies to create the opportunity to provide moderate-and low-income housing development and rehabilitation activities within the City.

4. The City shall continue to implement its Natural Feature Overlay District (NFOD) to help reduce the amount of development in hazardous areas such as floodplains and steep slopes as well as natural areas such as wetlands and rimrock.

5. The City shall employ strategies that support federal and state Fair Housing laws and other federal and state fair housing requirements to affirmatively further fair housing.

6. The City shall allow and support the development of Accessory Dwelling Units in all residential zones where single-family detached homes are allowed, as required by State law.

7. The City shall allow for a mix of residential uses with other compatible uses in appropriate locations.

8. The City shall support the maintenance and development of manufactured homes as an affordable housing choice in appropriate locations.

9. The City shall continue to support and publicize programs implemented by partner organizations which promote energy efficiency and use of other sustainable building materials and practices in the construction and rehabilitation of housing.

10. The City shall consider supporting programs implemented by partnering agencies which address the needs of the unhoused, as well as people with specialized housing needs, including medical hardships.

11. The City shall encourage maintenance and rehabilitation of the existing housing stock, including the extension of services and support local or regional programs that provide funding for these efforts.

12. The City shall encourage efficient use of residential land within the Urban Growth Boundary.

13. The City shall regularly monitor its supply of buildable land and shall provide a sufficient amount of residential land to accommodate residential growth.

14. The City shall continue to provide opportunities for the flexible design and siting of housing through the use of its Planned Unit Development provisions and other alternative land use permitting procedures and processes.

15. The City shall support and encourage multi-modal transportation designs and provide access internally and adjacent to new and existing developments.

Public Services and Facilities (2024)

Chapter 8 Public Services and Facilities

Prineville's Comprehensive Plan

Table of Contents - Chapter 8

Purpose and Intent

Goals & Policies

Goal 1: Provide public facilities, services and private utility systems at levels necessary and practical for existing and future uses.

Goal 2: Maintain and regularly update public facility plans and capital improvement programs and budgeting.

Purpose and Intent

Public Services and Facilities

Adopted July 2024

Purpose and Intent

Public Facilities are improvements, which provide services through various government entities or through franchise agreements with private utilities. The purpose of this chapter is to identify existing public and private facilities and services and identify present and future needs based on projected growth.

Key public facilities are typically described as transportation, water, wastewater, storm drainage, planning & zoning, parks & recreation, solid waste collection, energy, communication, schools, emergency services, health services and community governmental services. While the City and other local providers offer a wide range of services, these key elements are essential to accommodating growth and maintaining public health and safety. Likewise, the City is required to prepare and maintain planning tools that make sure adequate levels of key services are available and not stressed beyond their carrying capacities.

The City of Prineville manages key facilities such as governance, police, transportation, water, wastewater, stormwater and some elements of recreation, which are under their jurisdiction. Services such as; health, parks & recreation, fire protection, solid waste collection, building permitting, schools, energy, other utilities and communication services are provided by other entities and in some cases through franchise agreements with the City.

This chapter does not list specific current or needed public improvements. That information is found in various facility plans, commonly referred to as "master plans" from each serving entity. The City maintains and adopts Public Facility Plans for Transportation, Water, Wastewater and Stormwater. The City also adopts facility plans by local partnering agencies for Parks & Recreation, Airport and others as may be applicable. Transportation (Chapter 6) and Parks (Chapter 4) are separate individual Chapters in this Comprehensive Plan. The most current versions of the aforementioned plans are supporting documents to the Comprehensive Plan and are hereby referenced and made part of this chapter.

Goals and Policies

Statewide planning Goal 11, OAR 660-015 (Public Facilities and Services); requires that cities plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban and rural development.

Goal #1: Provide public facilities, services and private utility systems at levels necessary and practical for existing and future uses.

Policies

1. Plans and development impacting public facility and service shall consider; desired service levels, system and area protections, infrastructure needs and impacts to the following areas within the UGB.

    - Police Protection
    - Fire Protection
    - Emergency Medical Service
    - Transportation
    - Parks and Recreation
    - Natural Open Space
    - Natural Hazards
    - Public Buildings
    - Water System
    - Wastewater System
    - Stormwater System
    - Solid Waste Management
    - Schools
    - Airport
    - Railroad
    - Other Public/Private Utilities

2. Plans providing for public facilities and services should be coordinated with plans; for the designation of urban boundaries, zoning, urbanizable land, rural uses and for the transition of rural land to urban uses. The following factors shall be considered when determining public facility locations:

    - Availability and cost of usable land
    - Geographic restrictions
    - Carrying capacity of planning area
    - Operational efficiency
    - Related project improvements
    - Long term cost burden
    - Disruption of residential areas
    - Comprehensive Plan goals and policies

3. Public facilities and services in urban and urbanizable areas should be provided at levels necessary and suitable for urban uses without reducing service levels of existing residents.

4. A public facility or service should not be provided to outlying urbanizable areas within the UGB, unless there are provision for the coordinated annexation and development of all other urban facilities, services and rights-of-way appropriate to that area.

5. Collaborate with private utility companies to ensure equitable access to services throughout the City. Various agencies and entities other than the City of Prineville may be allowed to use City rights-of way. This may require the imposition of franchise agreements and special protocols and fees. In no case, shall these entities create a situation whereby the City must subsidize activity or repair damage caused by other service providers.

6. All utility lines and facilities should be located on or adjacent to existing public or private rights-of-way to avoid easements and dividing lots. Whenever feasible, all utility lines and components shall be placed underground.

7. New Development shall not exceed the carrying capacity of public facilities and services. New development shall provide appropriate infrastructure and public services or mitigate for such impact as a condition of development. Anticipated growth within the community may require expansion of facilities faster than the local government can provide. In these cases, it is essential that growth pay its own way in order to avoid unnecessary impacts upon existing residents and quality of life. This means that new development may need to supply an array of services to developments ahead of the City schedule and at their own cost, subject to City approval and authorization before development.

8. The City and other agencies and partners should utilize sustainability practices and other techniques for sustaining limited resources and facilities including such things as; recycling programs, preservation of natural areas, water conservation, wastewater reuse, air quality monitoring, energy production and energy consumption.

Goal #2: Maintain and regularly update public facility plans and capital improvement programs and budgeting.

Policies

1. City Facility Plans for transportation, wastewater, water and stormwater shall be adopted and periodically updated throughout the planning period.

2. The City shall periodically update short- and long-term Capital Improvement Plans (CIPs) for public facilities throughout the planning period, including property acquisition needs.

3. The City shall adopt and periodically update funding methodologies and coordinate investments to pay for and leverage planned capital improvements.

4. The City shall explore innovative ways of providing public facilities and services as well as funding alternatives to ensure the equitable and adequate development and implementation of public facilities and services

The Following table is a log of amendments to the adopted 2007 Prineville Comprehensive Plan.

ORD	DATE	DESCRIPTION
1151	May 28, 2008	Zone Map Amendment from Industrial to Residential
1157	October 14, 2008	Zone Map Amendment from Industrial to Residential
1159	December 9, 2008	Zone Map Amendment from Industrial to Outlying Commercial and Residential
1182	July 12, 2011	Zone Map Amendment from Heavy Industrial to Light Industrial
1193	August 14, 2012	UGB adjustment (swap) from and too Light Industrial
1197	May 28, 2013	UGB Expansion to Light Industrial
1199	August 27, 2013	Zone Map Amendment for Ochoco Lumber Site from Heavy Industrial to Mixed Use and adopting a Master Plan
1200	October 8, 2013	UGB Expansion to Light Industrial
1201	November 26, 2013	Adopting new Transportation Systems Plan (TSP)
1205	June 24, 2014	Amending TSP to address issues with Ochoco Lumber mixed use site.
1210	December 17, 2014	UGB Expansion to Light Industrial
1212	March 31, 2015	Text Amendment to include language for medical marijuana
1215	June 23, 2015	Text Amendment to include language for recreational marijuana
1221	February 9, 2016	UGB Expansion to Light Industrial

Foreword

This document contains the Oregon economic and revenue forecasts. The Oregon economic forecast is published to provide information to planners and policy makers in state agencies and private organizations for use in their decision making processes. The Oregon revenue forecast is published to open the revenue forecasting process to public review. It is the basis for much of the budgeting in state government.

The report is issued four times a year; in March, June, September, and December.

The economic model assumptions and results are reviewed by the Department of Administrative Services Economic Advisory Committee and by the Governor's Council of Economic Advisors. The Department of Administrative Services Economic Advisory Committee consists of 15 economists employed by state agencies, while the Governor's Council of Economic Advisors is a group of 12 economists from academia, finance, utilities, and industry.

Members of the Economic Advisory Committee and the Governor's Council of Economic Advisors provide a two- way flow of information. The Department of Administrative Services makes preliminary forecasts and receives feedback on the reasonableness of such forecasts and assumptions employed. After the discussion of the preliminary forecast, the Department of Administrative Services makes a final forecast using the suggestions and comments made by the two reviewing committees.

The results from the economic model are in turn used to provide a preliminary forecast for state tax revenues. The preliminary results are reviewed by the Council of Revenue Forecast Advisors. The Council of Revenue Forecast Advisors consists of 15 specialists with backgrounds in accounting, financial planning, and economics. Members bring specific specialties in tax issues and represent private practices, accounting firms, corporations, government (Oregon Department of Revenue and Legislative Revenue Office), and the Governor's Council of Economic Advisors. After discussion of the preliminary revenue forecast, the Department of Administrative Services makes the final revenue forecast using the suggestions and comments made by the reviewing committee.

Readers who have questions or wish to submit suggestions may contact the Office of Economic Analysis by telephone at 503-378-3405.

Executive Summary

March 2024

Historically, inflationary economic booms have not ended well. The pandemic is increasingly looking like the exception. Inflation has cooled and is near the Federal Reserve's target. The labor market rebalanced last year. However, strong recent data in terms of consumer spending, job gains, and real GDP growth raise the possibility of inflation rebounding in the quarters ahead. The Fed is indicating they will cut interest rates this year, but appear to be in no real hurry given the economic strength.

Economic growth is combination of the number of workers and how productive each is. So far this cycle, Oregon's productivity gains have outpaced the nation, while local job growth is in the middle of the pack across states. The outlook for labor and capital are on differing, structural trends. Labor is both cyclically strong today, and structurally tight due to demographics. The recently released 2023 population estimates show that Oregon's population continued to stagnate during the pandemic. Our office has lowered the population outlook as a result. In the decade ahead Oregon's population is expected to rebound, but grow at just 0.6 percent per year. This lower population forecast feeds directly into a relatively smaller labor force and a bit less personal income earned in the years ahead.

The good news is that between the start-up boom, increased federal investment, and potential of generative AI, productivity is set to increase faster in the decade ahead. These gains will boost the overall economy and makeup for slower labor growth. Even so, one of the key dynamics for stronger business investment is a tight labor market. When workers are scarce, and expensive, firms are more willing, if not forced to invest in labor-saving technology and processes.

Oregon's state revenue outlook remains stable heading into the personal income tax filing season. The underlying economic outlook is relatively unchanged, and collections are tracking closely to expectations. Compared to the December 2023 forecast, General Fund revenues are raised $76 million. However, total available resources are increased $558 million in large part due to accountants closing the books on the previous 2021-23 biennium. Unspent allocations last biennium revert to the General Fund, boosting resources in 2023-25.

Although overall revenue collections are matching expectations, there have been some notable surprises. The most significant of which is the persistence of the six-year boom in Oregon's traditional corporate income and excise taxes. Tax collections have far outstripped growth in underlying corporate profits. The longer the surge in collections persists, the more likely it becomes that tax reforms enacted at the federal and state levels have permanently increased Oregon's corporate tax base, and that the step up in collections will remain with us going forward.

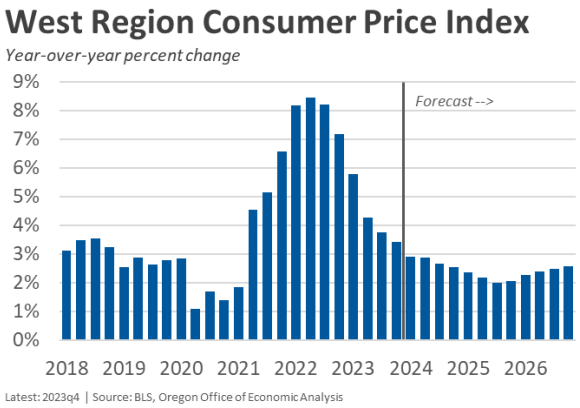
The modest reduction in expected population and job gains reflected in the underlying economic outlook filters through to a somewhat weaker long-term forecast for personal income taxes. That said, these changes do not change the general nature of the revenue forecast, with the largest reduction in expected General Fund resources amounting to less than one percent of revenue in the 2029-31 budget period.

Economic Outlook

Macroeconomic Setting

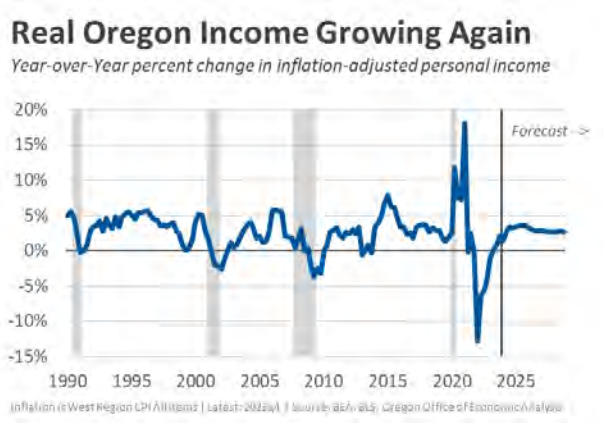
In recent years, economists were worried about the high probability of recession. Historically, inflationary economic booms have not ended well. The Federal Reserve was willing to risk a recession in order to get inflation under control. Encouragingly, the past year has gone better than economists could have hoped for. Inflation is at or near the Fed's target. The labor market has rebalanced and is no longer overheated. Importantly, underlying economic growth, as measured by real GDP and consumer spending, remains strong.

The challenge for the Fed is threading the needle for monetary policy to continue to keep inflation near target, and ensure the expansion continues. Today the Fed is indicating they will make three quarter point rate cuts this year. Given inflation is already near target, financial markets priced in more like six rate cuts , double what the Fed indicated.



As recent national economic data continues to show good to great gains, financial markets are repricing interest rates higher, realizing the Fed may not cut rates as quickly, or as deeply as market participants thought just a few weeks ago.

An important dynamic is that inflation has slowed further than headline economic growth, meaning real growth, or inflation-adjusted growth is picking up. In particular, personal income is once again outpacing inflation, raising the living standards of Americans and Oregonians. It may be somewhat tautological, but real income growth supports real consumer spending growth, which in turn results in real economic growth as firms produce more goods and services to sell to customers. And the need to produce and sell more products increases labor demand.



The pandemic and reopening bullwhip effects are still reverberating to some degree. However as consumer spending remains strong, and inventories dwindle, increased manufacturing and logistics activity is needed to restock. These cyclical industries have been down in the past year or so, which caused some of the recession concerns. However the outlook is brighter and goods-producing industries are expected to stabilize in terms of employment, and increase production this year.

Ultimately, the risk for the Fed is cutting rates too quickly, or deeply which may spur stronger economic growth and a rebound in inflation, versus not cutting rates quickly or deeply enough thus leaving

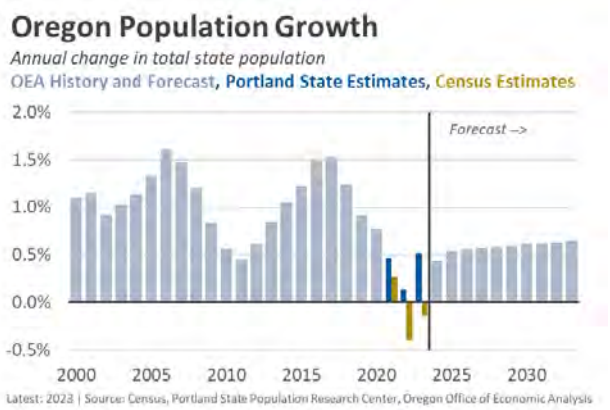
interest rates too high and ultimately chocking off growth. Practically speaking, the difference between three and six rate cuts and whether they start next month or in a handful of months likely does not amount to much for the macroeconomy. The key is that the Fed is generally moving policy in the right direction given the state of the economy. The risks lie with larger policy errors, and policy not being nimble enough to offset whatever unexpected shocks or trends there are just beyond the horizon. But should there be a growth scare for whatever reason, expectations are the Fed will cut rates a bit sooner, and/or deeper than they currently are indicating.

Oregon's Economic Outlook

Locally, economic growth is combination of the number of workers and how productive each is. So far this cycle, Oregon's productivity gains have outpaced the nation, while local job growth is in the middle of the pack across states. Looking forward the outlook for labor and capital are on differing, structural trends. Labor is both cyclically strong today, and structurally tight due to demographics. The good news is that between the start-up boom, increased federal investment, and potential of generative AI, productivity is set to increase faster in the decade ahead. These gains will boost the overall economy and makeup for slower labor growth. Even so, one of the key dynamics for stronger business investment is a tight labor market. When workers are scarce, and expensive, firms are more willing, if not forced to invest in labor-saving technology and processes.

2023 Population Estimates and Forecast Changes

Late last year both Portland State University's Population Research Center, and the Census Bureau release their 2023 mid-year estimates. Once again the estimates differed with PSU showing a small increase and Census showing a small decline. While the cumulative gap between the two estimates over the 2020-2023 period is larger – approximately 56,000 – the bottom line is Oregon's population growth continues to be much slower than in decades past.



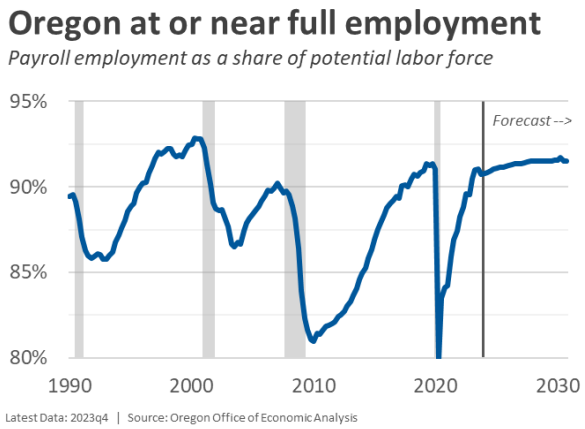
A slight gain or loss does matter from a big picture narrative, but the practical matter is the latest estimates are another indication that some of the pandemic migration patterns may be more permanent that previously believed. Our office's baseline has been, and continues to be for a modest rebound in growth in the years ahead. Oregon continues to have plentiful job opportunities and provide scenic and recreational amenities. However, the combination of bad housing affordability, and increased remote work opportunities likely means migration flows will be less than they have been historically.

Our office has lowered the population outlook over the forecast horizon. In the decade ahead, the forecast now calls for 0.6 percent annual growth, down from the 0.7 percent annual growth in the previous forecast. This lower population outlook does feed directly into a slight reduction in the

economic outlook of the state as well. Keep in mind that the state's population, labor force, income, housing demand and the like are expected to increase, just now at a slightly slower rate.

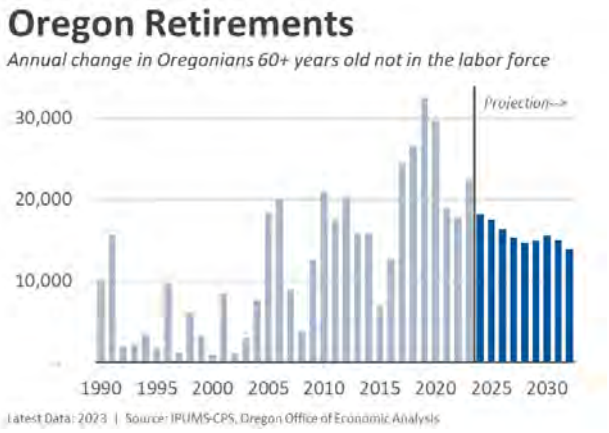
Labor is Cyclically Strong, and Structurally Tight

Employment in Oregon has fully recovered from the pandemic. On an age-adjusted basis, the share of Oregonians with a job is nearly as high as it has ever been in our recorded history. Economists tend to call this full employment. The nature of our economic forecast is that the labor market remains cyclically strong at these high employment rates until whenever the next recession comes. This is the main reason that firms are struggling to find workers, the simple fact that nearly everyone who wants a job, already has one, and those that do not cannot more readily find one given the number of job openings in the economy.



However, beyond the cyclical strength in the economy today, the labor market is structurally tight for demographic reasons. With a growing older adult population, the number of retirements picked up last decade.

With the large Baby Boomer generation continuing to reach their traditional retirement years in the decade ahead, retirements will be larger as well. It is economically difficult for firms to replace workers with a lifetime of experience and expertise, especially when it comes to within firm experience and institutional knowledge. As such there may be a short-term loss of productivity as firms train new workers, or employees move into new roles within the company. Such an impact is typically temporary, and difficult to see at the macro level even if at the micro level the impact is real.

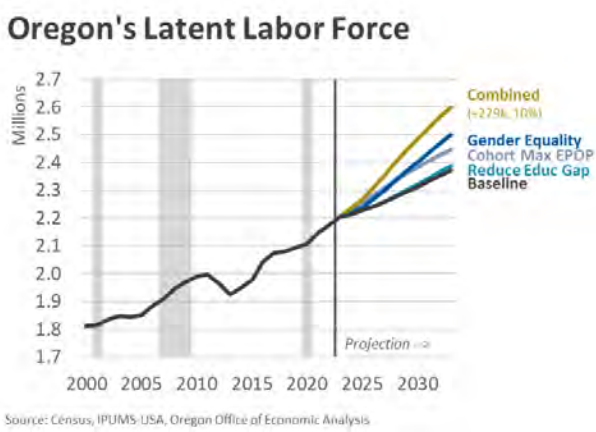


Now, Oregon's labor force is expected to grow in the years ahead. However, given the state's low birthrate in recent decades, and the slower migration outlook, the net labor gains are expected to be smaller than in decades past. Firms looking to hire will need to dig deeper into the resume stack and choose candidates they may have passed over in a weaker economy. This includes workers with an incomplete skillset, and on the job training becomes even more important than ever.

Additionally, firms are likely to begin to hire to a greater degree from the state's Latent Labor Force. The economy may be at the typical labor force constraint today, but that does not mean there are no more potential workers entirely. The Latent Labor Force is based on historical disparities when it comes to

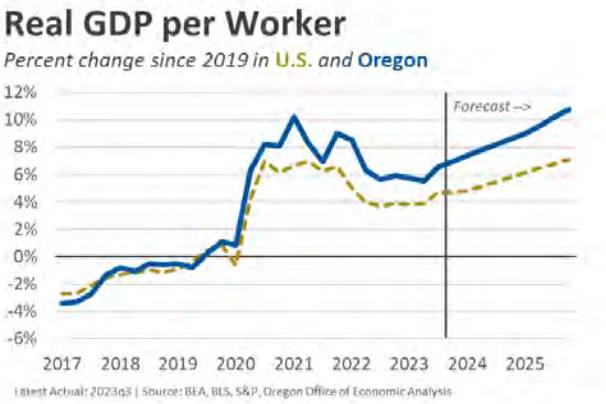
jobs and wages for Oregonians of different races and ethnicities, different levels of educational attainment, and different genders, or sex.

Today the Latent Labor Force finds that there remains a sizable pool of potential workers already living in Oregon when it comes to addressing, and reducing these historical disparities. Now, a bit of good news is that the Latent Labor Force today is a bit smaller than when our office previously did the analysis. Partially this is due to a slower population outlook, but also this is because these disparities are smaller today than a few years ago. Some progress on closing these economic gaps is being made already in the strong economy, even as gaps remain.

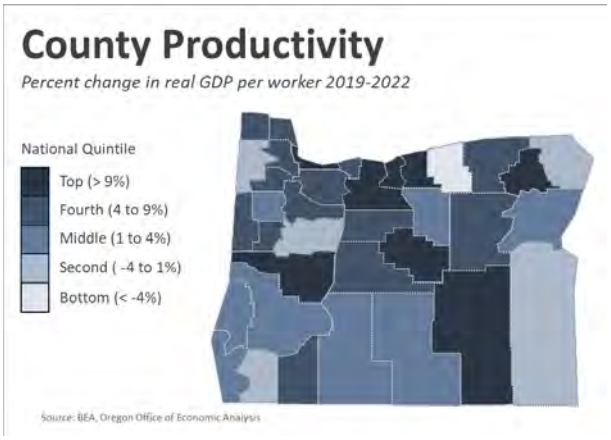


Productivity Boosts Economic Growth

Given the labor outlook, firms looking to expand will need to rely even more on capital investment in the years ahead. Faster productivity growth raises the speed limit of the overall economy. It also helps keep inflation in check, and can result in strong wage gains for existing workers. A key dynamic to increased investment is a tight labor market. When labor is scarce, and expensive, it provides a need and an incentive for firms to invest in labor-saving technologies and processes. Additionally the combination of the start-up boom, increased federal investment alongside private activity, and the potential for generative AI, productivity should be better in the years ahead.



So far this cycle, Oregon has seen stronger productivity gains than the nation and the typical state. However recent revisions to state GDP have brough Oregon's gains closer to the pack, but still above average. While real GDP per worker is a crude measure of productivity, the better measure of state productivity produced by the Bureau of Labor Statistics is only available once per year. 2023 state estimates are due out in May, and we will have a better idea at that time of how exactly Oregon compares across states.

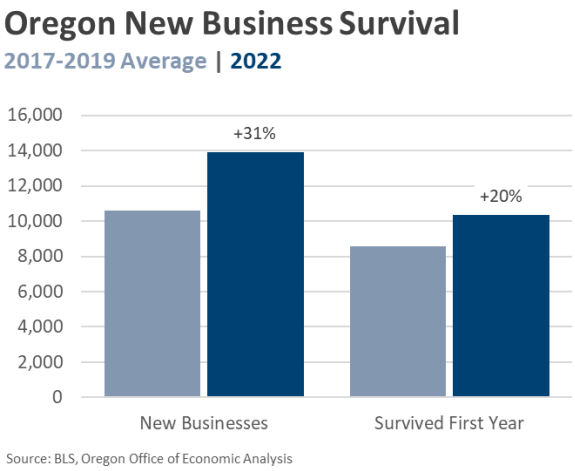


But for now, these gains are seen across the state. 28 of Oregon's 36 counties have seen faster productivity growth than the typical U.S. county nationwide. 10 Oregon counties, lead by Crook, are among the top

quintile nationwide, meaning among the Top 20% for gains through 2022. Note that 2022 county level data is the most recently available information and was released in December.

In addition to business investment in what economists call physical capital (generally plants, equipment, software etc) there are other types of capital. These include natural capital, financial capital, human capital, and social capital. Investment and growth among any of these types of capital should lead to stronger economic gains.

Another source of optimism on the outlook comes from the start-up boom during the pandemic. New businesses are key drivers of innovation as they are generally better able to bring new products, services, and efficiencies to the marketplace.



Since 2019, the number of new businesses has increased nationwide and here in Oregon and really has not slowed down. In terms of the outcome, even if the probability that any given new firm ultimately succeeds remains the same, having more ping pong balls in the hopper means the cumulative probability there are successes is higher today than before the pandemic start-up boom. The absolute number of business closures is rising as well, given the increase in start-ups, but the closure or failure rate, and the number of business bankruptcies remains tame. The net impact of the start-up boom is a macroeconomic tailwind and should continue in the years to come as the Millennials age into their peak-entrepreneurial years which are one's late 30s and early 40s.

Finally, as discussed in more detail in the September 2023 forecast1, the combination of increased federal investment, and the more speculative impact of generative AI on white-collar jobs is likely to boost productivity in the years ahead. In particular for Oregon, the CHIPS and Science Act is expected to result in tens of billions of dollars of semiconductor investment in the state, supporting thousands of near-term construction jobs, and creating thousands of permanent jobs once the projects are complete. The challenge for the outlook today is that the semiconductor industry is in a cyclical downswing. Local industry job losses are mounting, even if the medium- and long-run outlook are positive. For now, our office is keeping those investments and growth in the forecast, but tracking actual employment numbers lower as the industry adjusts to current market and economic conditions.

Zero Migration, a Demographic Alternative Scenario

Our office has developed a demographic alternative scenario of what the state's economy, and public tax revenues may look like should migration not rebound as expected. What follows is a short summary of

[1] https://digital.osl.state.or.us/islandora/object/osl%3A1015130/datastream/OBJ/view

that scenario. You may find the full report in the December 2023 forecast, and a standalone copy on our website[2].

Historically migration has been the primary reason Oregon's economy has outpaced the typical state over time. However the bottom line impacts of the Zero Migration scenario are smaller than our office first anticipated. There are at least three main reasons why this appears to be the case.

The first reason is simply that the baseline population forecast is already weak from an historical perspective. Removing the modest population gains of less than one percent per year has less of an impact than if the baseline had population growth of two or three percent, like Oregon experienced in decades past.

The second reason is due to inflation and rising incomes and asset values for existing residents. While the state's overall population may decline slowly given there is no migration to offset the fact deaths outnumber births, total incomes and taxes paid will increase. However, those aggregate increases will be slightly slower given the lack of any underlying population gains, even as incomes per worker or per household will increase in the years ahead.

The third reason is one of timing, and focusing on the first decade of no net migration. Given the age demographics of migration to Oregon, and the fact that middle-aged Oregonians, and in particular late middle-aged Oregonians have the largest incomes, of which many are taxed at the highest rate, the economic and revenue impacts are likely to be greater in the second or third decade than in the first.

As such, seemingly small differences in any given year have little long-run implications for the trajectory of Oregon's economy or state revenues. However, like a snowball just starting to roll down a mountain, as these small annual changes accumulate, so too do the long-run differences between the baseline outlook and the world in which migration does not return to the state.

Alternative Scenarios

The baseline outlook is our forecast for the most likely path for the Oregon economy. As with any forecast, however, many other scenarios are possible. The alternative scenarios below are not the upper or lower bounds to all outcomes, but rather are two plausible scenarios modeled on realistic assumptions. For the revenue implications, see page 20.

Boom/Bust Scenario: Moderate Recession

Inflation could rebound and remain above the Federal Reserve's target. As such, it is possible will need to raise interest rates further or hold them higher for longer, to cool the economy. The combination of high inflation, high interest rates, and slowing economic growth is problematic. Ultimately, the boom could turn into a bust later this year.

[2] https://oregoneconomicanalysis.com/2024/01/10/report-zero-migration-a-demographic-alternative-scenario/

For now, the most likely recession scenario is for a moderate sized downturn. There are no clear imbalances in the economy, household finances remains in good shape, and firms will be reluctant to let go of workers given the structurally tight labor market.

The moderate recession scenario is for a three quarter decline in employment totaling 2.9 percent, followed by a six quarter recovery period, more in line with the so-called jobless recoveries following the 1990 and 2001 cycles, compared to the faster recoveries in the 1950s, 1960s, and 1970s.

The three percent decline in employment is a loss of nearly 60,000 jobs. No industry is spared, but goods-producing ones see relatively larger losses at 4.5 percent, while services see slightly fewer losses at 2.8 percent, and the somewhat more stable public sectors experiences job losses of 2.3 percent. The unemployment rate increases to nearly 7 percent by early 2025. Nominal income does not fall outright but growth slows considerably. Next biennium, in 2025-27, total personal income in Oregon is 2.6 percent below the baseline.

Alternative Scenarios **Mar 2024**

	2023	2024	2025	2026	2027	2028
Employment						
Base: Soft Landing	2.4%	0.5%	0.7%	0.7%	0.7%	0.7%
Pes: Boom/Bust	2.4%	0.7%	-2.0%	2.0%	1.3%	0.8%
Opt: Pop Rebound	2.4%	0.6%	1.1%	1.3%	1.5%	1.3%
Unemployment Rate						
Base: Soft Landing	3.8%	3.9%	4.1%	4.1%	4.1%	4.1%
Pes: Boom/Bust	3.8%	4.7%	6.5%	5.5%	4.6%	4.2%
Opt: Pop Rebound	3.8%	3.7%	3.7%	3.7%	3.6%	3.6%
Personal Income						
Base: Soft Landing	4.8%	5.4%	5.7%	5.5%	5.3%	5.1%
Pes: Boom/Bust	4.8%	6.0%	2.1%	5.9%	5.8%	5.3%
Opt: Pop Rebound	4.8%	5.5%	6.1%	6.1%	6.0%	5.7%

Optimistic Scenario: Population Rebound

Pandemic migration patterns differ from recent history substantially. There is good reason to think some of those changes will remain in the decade ahead, particularly when it comes to the combination of housing affordability and working from home resulting in lower migration to Oregon than in decades past. However, such a slow growth baseline does leave upside risks. What would happen if Oregon were to see a typical cyclical rebound in migration in the years ahead?

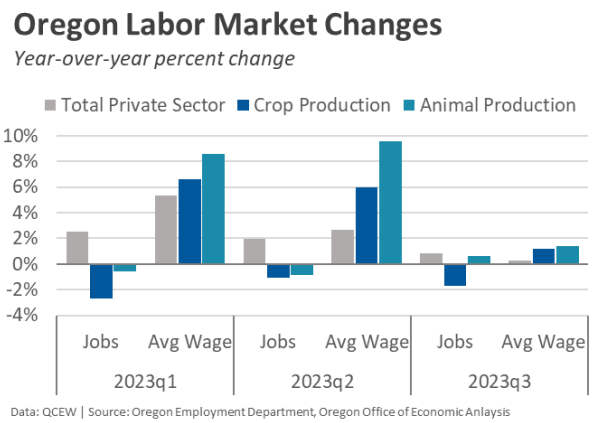
In the population rebound, Oregon's economy grows faster than in the baseline. A larger population increases local consumer demand, and boosts the labor force from which Oregon businesses can hire and expand at a faster rate. By 2033, Oregon's employment is 71,000 higher than in the baseline, and total personal income is 3.3 percent higher than in the baseline.

Oregon's Agricultural Economy

The Oregon Legislature passed HB 4002 (2022) which establishes maximum hour and overtime compensation requirements for agricultural workers. The law went into effect starting at the beginning of 2023. Moving forward, our office will analyze and monitor the economic and labor market data to assess any impacts from the law. Our office will work to incorporate these changes, if any, in the broader context of the state's agricultural economy. It will take some time before data is available to assess any impacts.

Even so, our office has been highlighting the importance of agriculture to the state's economy since the law's passage. We have dug into farm employment, income, and sales at the state and county level, in addition to international exports. Additionally we discussed how ag fits in with the broader food economy in the state and nation, and also the outlook for consumer spending on food and price forecasts related to revenues and costs. Note that the 2022 Census of Agriculture data will be released on February 13, 2024. This is the most detailed source of data at the state and county level and is done every five years. Our office will provide a summary of the 2022 Ag Census in the next forecast.

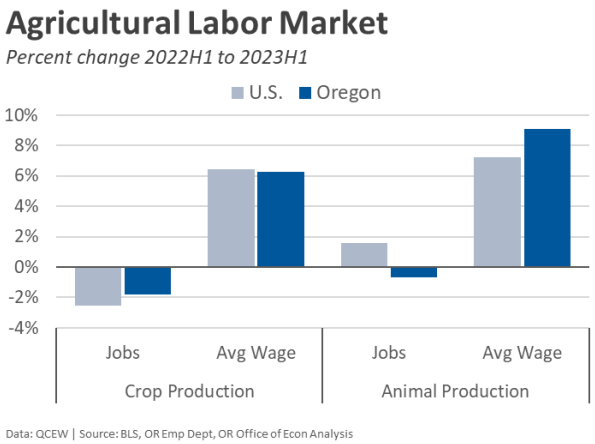
In recent quarters we have highlighted QCEW data, the nearly real-time data coming from businesses submitting records for unemployment insurance purposes. Agricultural data is very seasonal given harvests, so getting a clear handle on trends is a bit more challenging. However, our office will report the latest information as it become available. As of this forecast, there are now three quarters of 2023 Oregon data and two quarters of US (all states) data. The Bureau of Labor Statistics is set to release third quarter data for all states on February 21, 2024.



For now, our office will focus on high level changes in terms of employment and wages on a year-over-year basis. Here in Oregon, employment trends within agriculture are weaker than the broader economy in 2023. Both crop production and animal production employment has declined, while the private sector overall is growing. In terms of wage gains, Oregon wages are rising in a tight labor market, but average wages in both crop and animal production are far outstripping the statewide increases. At first blush, this pattern of weaker employment and strong wage gains likely fits the expected patterns of what the impact of the new law would be.

Keep in mind that this is still preliminary data. It is far from enough information to make any real assessments of how the law is impacting the state economy. It is also at a high level, using a simple year-over-year comparison. Further analysis looking at the number of hours worked per employee is needed to better gauge the impacts. That data will not become available for some time.

Additionally, these same general patterns are seen nationally as they are locally, at least for the first half of the year (January through June). Across all states, agricultural employment is lagging the broader economy while wages are rising faster. As such, without further, detailed analysis, it is hard to say whether Oregon's experiences are due to the new law, or more a reflection of broader industry trends given commodity prices and the like.



Moving forward, our office will work with other state agencies to gather and analyze the available data. Future quarterly forecasts will include updates to the underlying ag economy, when available, and any such analysis of the impacts of the new law.

Longer-Term Forecast Risks

The economic and revenue forecast is never certain. Our office will continue to monitor and recognize the potential impacts of risk factors on the Oregon economy. Although far from comprehensive, we have identified several major risks now facing the Oregon economy in the list below:

- U.S. Economy. While Oregon is usually more volatile than the nation overall, the state has never missed a U.S. recession or a U.S. expansion. In fact, Oregon's business cycle is perfectly aligned with the nation's when measuring peak and trough dates for total nonfarm employment.
- Housing Affordability. New housing supply has not kept pace with demand in either the ownership or rental markets. Oregon has underbuilt housing by 140,000 units in recent decades[3]. Our office will update the state's projected housing need this year. However, to the extent home prices and rents rise significantly faster than incomes, it is a clear risk to the outlook. Worse housing affordability hurts Oregonians as they need to devote a larger share of their household budget to the basic necessities. Furthermore, worse affordability may dampen future growth as fewer people can afford to live here, lowering net in-migration, and the size of the labor force in the years ahead.
- Global Spillovers. The international list of risks seems to change by the day. Right now there are ongoing wars in Europe and the Middle East, and the risk of war in Southeast Asia has been uncomfortably high in recent years. Longer-term concerns regarding commodity price spikes in Emerging Markets, or the strength of the Chinese economy – the top destination for Oregon exports – are top of mind.
- Federal Fiscal Policy. Changes in national spending impact regional economies. In terms of federal revenues, spending, and employment Oregon is generally in the middle of the pack across states. Oregon does see larger impacts related to land management and forest policies, including direct federal employment. Oregon ranks below average in terms of military-dependent industries and lacks a substantial military presence within the state.

[3] https://www.oregon.gov/ohcs/about-us/Documents/RHNA/RHNA-Technical-Report.pdf

- Climate and Natural Disasters. While the severity, duration, and timing of catastrophic events like earthquakes, wildfires, and droughts are difficult to predict, we know they impact regional economies. Fires damage forests with long-term impacts, and short-term disrupt tourism. Droughts impact our agricultural sector and rural economies to a greater degree. Whenever Cascadia, the big earthquake, hits, we know our economy and infrastructure will be crippled. Some economic modeling suggests that Cascadia's impact on Oregon will be similar to Hurricane Katrina's on New Orleans. Longer-term issues like the potential impact of climate change on migration patterns are hard to predict and generally thought to be outside our office's forecast horizon. Even so, it is a reasonable expectation that migration flows remain strong as the rest of the country becomes less habitable over time. The fact that private insurance markets in places like Florida (hurricanes and flooding) and California (wildfires) are now pricing in climate risks, means that climate migration could occur sooner than previously expected.
- Initiatives, Referendums, and Referrals. Generally, the ballot box and legislative changes bring a number of unknowns that could have sweeping impacts on the Oregon economic and revenue picture.

Extended Outlook

Oregon typically outperforms most states over the entire economic cycle. This time is no different, however the expectations are that the relative growth advantage may be a bit smaller than it has been historically. The primary reason being slower population, and labor force growth than in decades past. Our office is a bit more bullish on Oregon's economic and population growth than S&P Global is. Right now S&P has Oregon's growth from 2023 to 2028 right in the middle of the pack nationally. Their forecasts rank Oregon's real GDP growth to rank 24th fastest among all states, population gains are the 25th fastest, and employment growth ranks 26th fastest.

Over the extended forecast horizon our office has identified four main avenues of growth that are important to continue to monitor: the state's dynamic labor supply, the state's industrial structure, productivity, and the current number of start-ups, or new businesses formed.

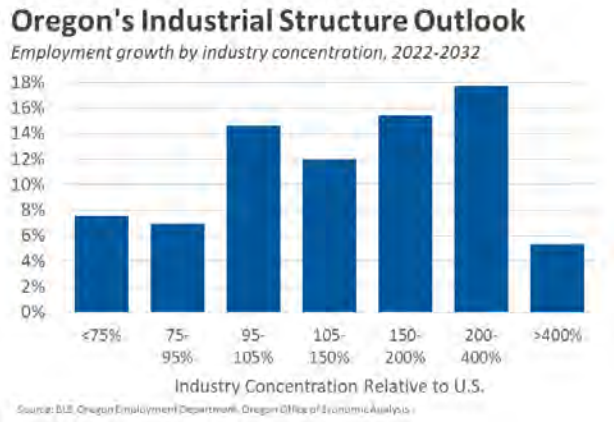
Labor Supply. Oregon has typically benefited from an influx of households from other states, including an ample supply of skilled workers. Households at least used to continue to move to Oregon even when local jobs are scarce, as long as the economy is equally bad elsewhere, particularly in California. Relative housing prices also contribute to migration flows in and out of the state. For Oregon's recent history – data available from 1976 – the labor force in the state has both grown faster than the nation overall and the labor force participation rate has typically been higher.

The good news today is that Oregon's labor force has never been larger, and the labor force participation rate has been higher that it was before the pandemic began, at least until the last handful of months of data. Even in this sometimes noisy, and unrevised data, the strength of Oregon's labor market is clear.

Moving forward, overall labor force participation rates will decline, simply due to the aging of the population. As more Baby Boomers enter into their retirement years, the share of all adults working or looking for work will fall as a result. As such, comparing Oregon's participation rates against a demographically-adjusted measure is important. Here, too, the current strength of the Oregon's labor market is evident, and encouraging.

The challenge moving forward is twofold. First, is overall population growth and whether that rebounds as expected in the years ahead. Second, whenever the next recession (or two) does come, maintaining a high participation rate and not seeing larger numbers of discouraged workers drop out of the labor force like they did following both the dotcom and housing busts. It was only once the economy became strong again in the late 2010s and early 2020s have some of those losses begun to be regained.

Industrial Structure. Oregon's industrial structure is very similar to the U.S. overall. However, Oregon's manufacturing industry is relatively larger, and weighted more toward semiconductors and wood products, compared to the nation which is more concentrated in transportation equipment (aerospace, and automobiles).



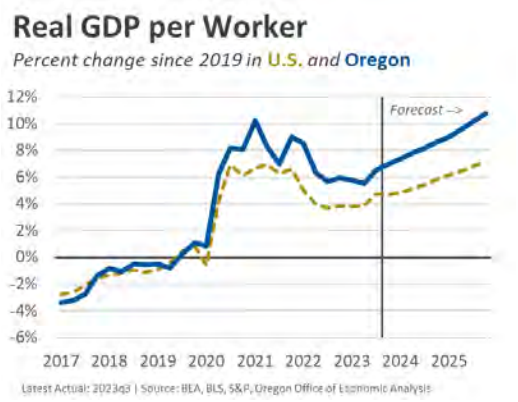
However, industries like timber and high-tech, which have been Oregon's strength in both the recent past and historically, are now expected to grow the slowest moving forward. Productivity and output from the state's technology producers is expected to continue growing quickly, however while employment will increase with expansions and the CHIPS Act, it will not increase as much as investment and sector productivity. Similarly, the timber industry remains under pressure from both market based conditions and federal regulations. Barring major changes to either, the slow growth to downward trajectory of the industry in Oregon is likely to continue.

With that being said, certainly not all hope is lost. Those top industries in which Oregon has a local concentration at least twice the national average comprise approximately 4 percent of all statewide employment. Slower growth moving forward is not a weight, but rather more of a lack of a boost.

Many industries in which Oregon has a larger concentration that then typical state are expected to perform quite well over the coming decade. These industries include management of companies, food and beverage manufacturing, published software along with some health care related firms.

The state's real challenges and opportunities will come in industries in which Oregon does not have a relatively large concentration. These industries, like consulting, computer system design, financial investment, and scientific R&D, are expected to grow quickly in the decade ahead. To the extent that

Oregon is behind the curve, then the state may not fully realize these gains if they rely more on clusters and concentrations of similar firms that may already exist elsewhere around the country.



Capital and Productivity. Ultimately, the economy's industrial structure combined with capital will result in increasing productivity. Higher productivity allows firms to produce and sell more products, and pay higher wages to its workers. Capital can come in many different forms including financial, natural, phsyical, human, and social. All can help raise firm productivity, benefiting the economy more broadly.

Today, the economy desparately needs better productivity, which has been sluggish this century. Early in the pandemic, productivity perked up as firms had to make due with reduced workforces at the same time consumer demand remained strong. However, as employment has rebounded, these productivity increases not entirely hold and eroded somewhat. The current outlook for producivity is more or less back to the pre-pandemic trend growth, although slightly above it. Increasing the stock and use of Oregon's capital would boost the economy overall. Increases in start-up activity, upcoming federal investment, and the potential of generative AI all point toward better productivty gains later this decade.

New Business Formation. New businesses are generally considered the primary source of innovation. New ideas, products, and services help propel future economic growth. Unfortunately in the decades leading up to the pandemic, start-up activity, while steady in level terms, was declining as a share of a growing economy. New businesses as a share of all businesses were at or near record lows in 2019. Employment at start-ups follow a similar pattern.

To the extent the lower levels of entrepreneurship were to continue in a post-pandemic world, and R&D more broadly is not being undertaken, slower productivity gains and overall economic growth is to be expected. However, to the extent that larger firms that have won out in today's marketplace are investing in R&D and making those investments themselves, then the worries about the number of start-ups today is overstated. It can be hard to say which is the correct view. That said, actual, realized productivity in the economy has been sluggish in recent decades.

Encouragingly, new business formation during the pandemic actually accelerated, stopping the long-run decline. New establishments continue to run at a higher level than in the year leading up to the pandemic. However, given the increased overall number of establishments, deaths or closures are now increasing as well simply due to the raw numbers, even if the death rate remains tame.

Looking forward, these gains provide some hope for future economic growth should some of these new firms bring new ideas, products, and efficiencies to market. Even if the per firm probability of success remains the same, having more ping pong balls in the lottery increases the overall probability that a few will survive and succeed tremendously.

Oregon Income Relative to U.S. One long-standing concern for some policymakers and analysts had been Oregon's relatively low income and wage compared to the rest of the nation. Encouragingly, the strong economic growth last decade did translate into meaningful increases in Oregon's per capita income and average wage. Today Oregon's per capita income relative to the U.S. is at its highest point since the dotcom bust two decades ago, and the state's average wage is at its highest relative point since the timber industry restructured and the mills started closing in the early 1980s.

Oregon's median household income in recent years has reach historic highs, even after adjusting for inflation. More importantly, it now stands 1.2 percent higher than the U.S. overall as of 2022. In recent years, this marks the first time in more than 50 years that Oregonian incomes for the typical household or family are higher than the nation. The fact that the strong regional growth translated into more money in the pockets of Oregonians, and regained the ground lost decades ago is one of the most important economic trends in recent generations.

Revenue Outlook

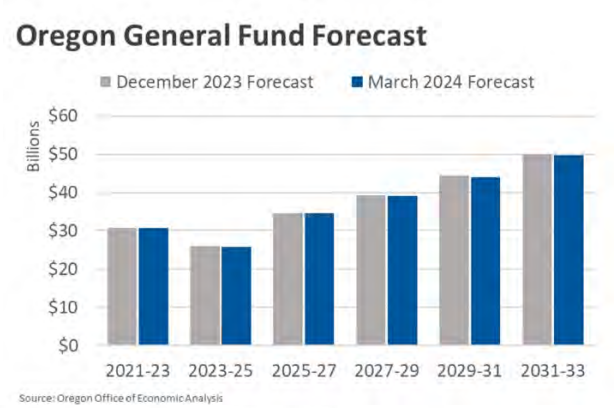
Revenue Summary

Oregon's state revenue outlook remains stable heading into the personal income tax filing season. The underlying economic outlook is relatively unchanged, and collections are tracking closely to expectations. As a result, overall revisions to the December 2023 forecast are small.

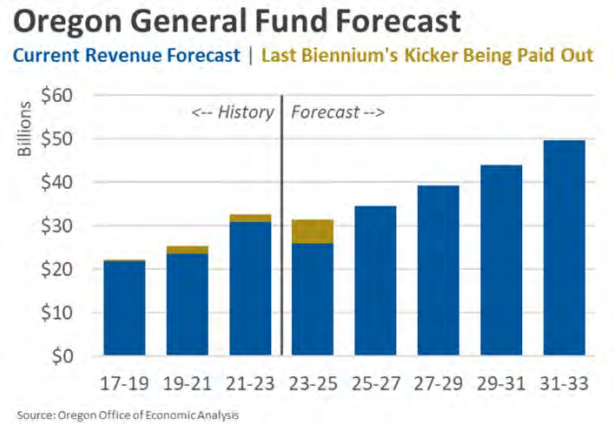
Although overall revenue collections are matching expectations, there have been some notable surprises. The most significant of which is the persistence of the six-year boom in Oregon's traditional corporate income and excise taxes. Tax collections have far outstripped growth in underlying corporate profits. The longer the surge in collections persists, the more likely it becomes that tax reforms enacted at the federal and state levels have permanently increased Oregon's corporate tax base, and that the step up in collections will remain with us going forward.

In addition to the surprising corporate income tax collections, forecasts for estate and liquor taxes have seen large revisions relative to the December 2023 outlook. Estate taxes have always been extremely volatile from month to month, but large outliers are clearly becoming more commonplace. As a result, the revenue outlook has been revised upward significantly. Offsetting this change, the outlook for liquor taxes has been revised downward as record sales during the pandemic appear to have plateaued.

The modest reduction in expected population and job gains reflected in the underlying economic outlook filters through to a somewhat weaker long-term forecast for personal income taxes. That said, these changes do not change the general nature of the revenue forecast, with the largest reduction in expected General Fund resources amounting to less than one percent of revenue in the 2029-31 budget period.



Even excluding the payment of the kicker credit, General Fund revenues were expected to be relatively unchanged when compared to the 2021-23 budget period. The unprecedented revenue boom seen during tax year 2021 is behind us, with collections expected to revert back to their long-term trends. Traditional gains in General Fund collections are expected to resume in the 2025-27 biennium and beyond.



The primary downside risk facing the near-term revenue forecast is the uncertain future of the

nationwide economic expansion. Should high interest rates, federal policy woes or economic weakness among our trading partners derail the U.S. economy, the expected growth in Oregon's tax collections will not come to pass.

Longer term, revenue growth in Oregon and other states will face considerable downward pressure over the 10-year extended forecast horizon. As the baby boom population cohort works less and spends less, traditional state tax instruments such as personal income taxes and general sales taxes will become less effective, and revenue growth will fail to match the pace seen in the past.

2023-25 General Fund Revenues

Gross General Fund revenues for the 2023-25 biennium are expected to reach $25.9 million. This represents an increase of $76 million from the December 2023 forecast, and an increase of $635 million relative to the Close of Session forecast. The vast majority of the increase can be attributed to collections of corporate income taxes, which continue to outstrip underllying corporate profits. Expected total available resources in the current 2023-25 biennium have been increased by $559 million after accounting for unspent appropriations during the 2021-23 budget period.

Table R.1

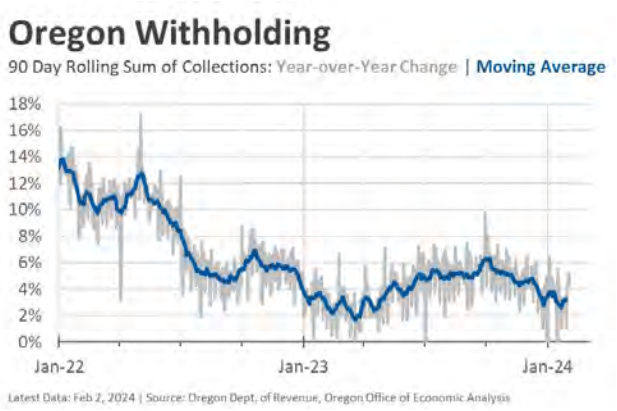
2023-25 General Fund Forecast Summary

(Millions)	2023 COS Forecast	December 2023 Forecast	March 2024 Forecast	Change from Prior Forecast	Change from COS Forecast
Structural Revenues					
Personal Income Tax	$21,019.7	$21,164.6	$21,180.1	$15.5	$160.4
Corporate Income Tax	$2,228.9	$2,647.2	$2,762.1	$114.9	$533.1
All Other Revenues	$2,011.3	$2,007.3	$1,953.1	-$54.3	-$58.2
Gross GF Revenues	$25,259.9	$25,819.1	$25,895.2	$76.1	$635.3
Offsets, Transfers, and Actions[1]	-$437.0	-$483.9	-$447.8	$36.1	-$10.8
Beginning Balance	$7,493.5	$7,636.2	$8,082.5	$446.3	$589.0
Net Available Resources	$32,316.4	$32,971.4	$33,529.9	$558.5	$1,213.5
Appropriations	$31,873.6	$31,873.6	$31,873.6	$0.0	$0.0
Ending Balance	$442.8	$1,097.8	$1,656.3	$558.5	$1,213.5
Confidence Intervals					
67% Confidence	+/- 6.7%		$1,739.9	$24.16B to $27.64B	
95% Confidence	+/- 13.4%		$3,479.8	$22.42B to $29.38B	

1 Reflects personal and corporate tax transfers, Rainy Day Fund tranfer, and Dept of Ag transfer

Personal Income Tax

Growth in withholdings of personal income taxes have slowed in recent months, consistent with a softening labor market Although there are other factors that drive withholdings of personal income taxes (e.g. retirement income, bonuses, and stock options), they are mostly driven by wages and salaries.



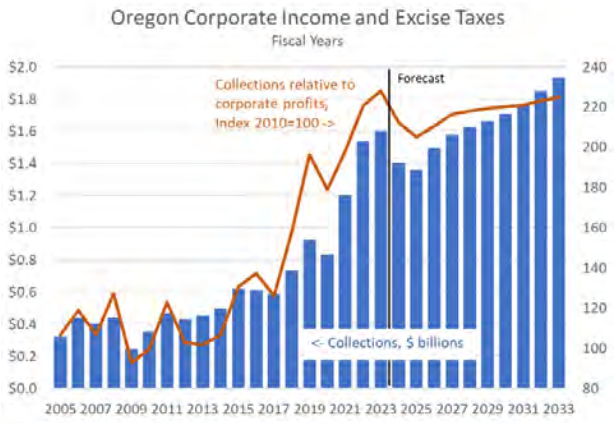
Although a cooling labor market makes an economic soft landing more likely, slow withholdings do cause concern. The majority of the time, withholding growth rates of 2% to 3% are only seen when Oregon is heading into, or coming out of, a recession.

Since the December 2023 forecast was released, Portland State University and the Census Bureau have released their 2023 mid-year population estimates. Although both estimates differ, each suggest that Oregon's population growth remains stalled. As a result, the baseline outlook for population and job gains has been lowered, putting downward pressure on expected income tax collections throughout the forecast horizon. However, in the current biennium, the weaker outlook for labor-related tax collections is offset by the surprising performance of investment income during 2023. In particular, the 25% growth seen in equity prices far outstripped the modest gains built into the personal income tax forecast.

Personal income tax collections will fall as we head into the 2024 tax season due to the record kicker credit being issued. Given that taxpayers are aware of the significant size of the credit, estimated personal income tax payments are down sharply at the beginning of the year. In the first months of 2024 large refunds will be issued, followed by relatively small year-end payments as April 15 approaches. After the extension filing season in the fall, the kicker will be largely paid out, and personal income taxes are expected to revert to trend.

Corporate Excise Tax

Oregon's traditional corporate income and excise tax collections have continued to outstrip expectations, and are growing faster than underlying corporate profits. Collections have nearly tripled over the past 3 biennia.



The source of this growth is difficult to pin down since corporate return data has only recently been released for tax year 2021. Since then, corporate collections have risen by one third.

However, given the timing of major tax reforms in 2017 (Federal TCJA, Oregon SB28) it is likely that some of the growth reflects a permanent increase in Oregon's corporate tax base. In particular, early data suggest that the switch to market-based sourcing in Oregon has driven additonal collections.

Tax liability for Tax Year 2021 grew by $210 million (20%), with about 75% of that coming from taxpayers that reported over $5 million in taxable income, largely from an increase in the number in that group. Most of this growth came from multi-state corporations. From 2020 to 2021, the industries with the largest growth were holding companies (up about $64 million), Manufacturing ($47 million), and Retail/Wholesale ($57 million together)

Other Sources of Revenue

Non-personal and non-corporate revenues in the General Fund usually account for approximately six or seven percent of the total. In the current 2023-25 biennium they account for 7.5 percent (largely driven by the record personal income tax kicker being paid out which reduces overall General Fund revenues.)

The largest such source are estate taxes, followed by interest earnings, liquor revenues, judicial revenues, and insurance taxes.

Relative to the previous forecast, these other revenue sources are lowered $54.3 million (-2.7%). This overall change is the net result of increases in estate taxes and interest earnings being offset by decreases in liquor earnings, judicial revenues, and tobacco taxes.

The liquor forecast is lowered significantly over the forecast horizon. Liquor sales boomed during the pandemic. So far this biennium topline sales have been fairly steady and are not showing continued growth like previous forecasts had built in. The updated outlook from OLCC adjusts to steady sales in the near-term, followed by longer-term growth. Compared to the December 2023 forecast, total liquor revenues in the current 2023-25 biennium are lowered by $132 million. This change reduces the General Fund outlook by $75 million, with the remainder impacting the other recipients of liquor revenues (see Table B.7 in Appendix B for more details.) OLCC will continue to monitor and analyze sales trends, and adjust the forecast accordingly moving forward.

Judicial revenues are also lowered sizably over the forecast horizon. In 2023-25 State Court Fees are lowered $10.7 million, while the Criminal Fine Account revenues are lowered $11.3 million. There are similar sized reductions to future biennia as well. These changes are in large part due to weaker revenues in the past year, indicating less of a rebound in court-related activity post pandemic than had been assumed in previous forecasts.

All types of tobacco – cigarettes, other tobacco products, and inhalant delivery devices – are tracking low in the most recent quarter. When combined with updated outlooks for consumer spending on tobacco, alongside usage rates, tobacco taxes are lowered over the forecast horizon. In 2023-25, cigarette revenues are lowered $15.1 million (-6.6%) overall, of which there is a $2.8 million reduction in the General Fund. Other tobacco products are lowered $3.1 million (-2.9%) overall, of which there is a $1.7 million reduction in the General Fund. Additionally, while outside of the General Fund, inhalant delivery revenues are lowered $0.7 million (-1.1%) due to tracking, while no long-run changes are made to the forecast. One potential issue for the revenue forecast is whether or not local (county) flavored tobacco bans go into effect or not. Such bans are not currently factored into the outlook as the issue is currently being debated in the courts.

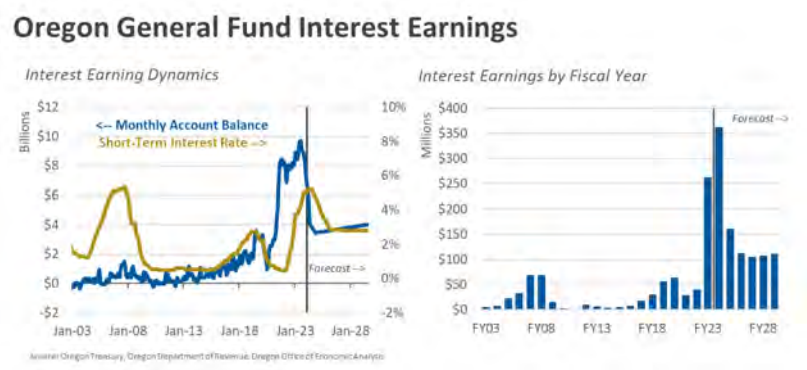
These larger revenue decreases are partially offset by increases to estate taxes and interest earnings.

Estate tax collections are significantly -- $35 million (+6.2%) – in the current 2023-25 biennium in large part due actual collections in November being the second largest month on record. However, due to stronger outlooks for home prices and asset markets, the longer term outlook is raised as well. In recent biennia, the strong estate tax collections are largely

driven by a small number of very highly valued estates.

The outlook for interest earnings is raised $11.6 million in the current 2023-25 biennium compared to the previous forecast, followed by upward revisions of approximately $1 million in subsequent biennia.

The combination of high fund balances today – the result of the inflationary economic boom outpacing forecast expectations – and high interest rates, means public sector interest earnings are now substantial. In the just completed Fiscal Year 2023, Oregon saw $262.5 million in interest earnings, which is more than the state received in the previous 10 years combined.



The forecast for interest earnings in the current Fiscal Year 2024 are expected to total $357.0 million.

The outlook for interest earnings is uncertain given potential timing issues. Today, fund balances are more than $6 billion higher than back in 2019. This tax season the record kicker will be returned to taxpayers, which is expected to reduce the balances from today's high-water mark. To the extent the timing of the kicker credits being paid out differ from expectations, or that short-term interest rates shift with broader changes in the financial markets or Fed policy, then the state's interest earnings will differ from this forecast.

Extended General Fund Outlook

Table R.2 exhibits the long-run forecast for General Fund revenues through the 2031-33 biennium. Users should note that the potential for error in the forecast increases substantially the further ahead we look.

Revenue growth in Oregon and other states will face considerable downward pressure over the 10-year extended forecast horizon. As the baby boom population cohort works less and spends less, traditional state tax instruments such as personal income taxes and general sales taxes will become less effective, and revenue growth will fail to match the pace seen in the past.

Table R.2

Tax Law Assumptions

The revenue forecast is based on existing law, including measures and actions signed into law during the 2023 Oregon Legislative Session. OEA makes routine adjustments to the forecast to account for legislative and other actions not factored into the personal and corporate income tax models. These adjustments can include expected kicker refunds, when applicable, as well as any tax law changes not yet present in the historical data. A summary of actions taken during the 2023 Legislative Session can be found in Appendix B Table B.3. For a detailed treatment of the components of the 2023 Legislatively Enacted Budget, see:

Legislative Fiscal Office's 2023-25 Budget Summary[4]

Although based on current law, many of the tax policies that impact the revenue forecast are not set in stone. In particular, sunset dates for many large tax credits have been scheduled. As credits are allowed to disappear, considerable support is lent to the revenue outlook in the outer years of the forecast. To the extent that tax credits are extended and not allowed to expire when their sunset dates arrive, the outlook for revenue growth will be reduced. The current forecast relies on estimates taken from the Oregon Department of Revenue's 2023-25 Tax Expenditure Report[5] together with more timely updates produced by the Legislative Revenue Office.

General Fund Alternative Scenarios

The latest revenue forecast for the current biennium represents the most probable outcome given available information. Our office feels that it is important that anyone using this forecast for decision-

[4] https://www.oregonlegislature.gov/lfo/Documents/2023-25%20Legislatively%20Adopted%20Budget%20-%20General%20Fund%20and%20Lottery%20Funds%20Summary.pdf

[5] https://www.oregon.gov/DOR/programs/gov-research/Pages/research-tax-expenditure.aspx

making purposes recognize the potential for actual revenues to depart significantly from this projection.

The near-term outlook is particularly uncertain right now. The probability of the soft landing, no recession baseline scenario is rising but the odds of a recession in coming years remains uncomfortably high. Our office's economic alternative scenarios (see page 7) include a Boom/Bust cycle with a recession beginning in the second half of 2024, and an optimistic outlook where population and migration rebound as they have in past cycles.

Alternative Scenarios — March 2024

Changes relative to the baseline ($ millions)

General Fund

	2023-25	2025-27	2027-29	2029-31	2031-33
Optimistic	$42	$395	$954	$1,323	$1,600
Pessimistic	-$1,003	-$1,726	-$674	-$580	-$457

Corporate Activity Tax

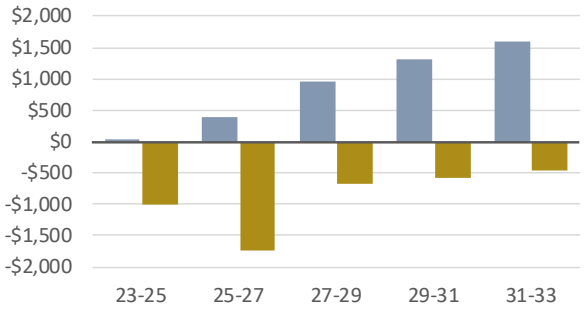
Optimistic	$44	$77	$128	$161	$184
Pessimistic	-$59	-$132	-$112	-$103	-$91

Source: Oregon Office of Economic Analysis

General Fund Revenues

Change from baseline ($ millions) for the Pessimistic Boom/Bust, and Optimistic Population Rebound



In a Boom/Bust scenario, the revenue impact will be felt in both the current 2023-25 biennium and the next 2025-27 biennium. Looking at the current 2023-25 biennium, in the pessimistic scenario, General Fund revenues in Oregon would be $1.0 billion lower than in the baseline. Revenues in 2025-27 would be recovering, and growing sequentially, but still $1.7 billion below the current baseline outlook.

Changes would also be seen outside of the General Fund among Oregon's consumption-based revenues as well. Such taxes are generally less volatile than income taxes and help to stabilize Oregon's overall revenue base. Specifically in 2023-25, the Corporate Activity Tax would be $59 million lower than the baseline, while Lottery is expected to be $24 million lower, and Marijuana revenues $4 million lower.

In 2025-27, the Corporate Activity Tax would be $162 million lower than the baseline, while Lottery would be $59 million, and Marijuana $11 million. Over time the economy and state revenues would make up the recessionary lost ground and nearly converge with the baseline outlook. However, recessions tend to leave scars, and the Boom/Bust scenario never fully regains all of the lost ground economically or in terms of state revenues.

In the Optimistic Scenario of a normal rebound in migration patterns, Oregon's economy and state revenues would fundamentally be on a stronger growth trajectory. In the current 2023-25 biennium, General Fund revenues would be $42 million above the baseline, while the increases build to $1.6 billion in the 2031-33 biennium. The Corporate Activity Tax follows a similar pattern where revenues would be $44 million above the baseline in 2023-25 and $184 million in 2031-33.

Corporate Activity Tax

Oregon's new corporate activity tax (CAT) went into effect January 2020. Revenues from this tax on business receipts are dedicated to education through the Fund for Student Success. The tax was designed to generate approximately $1 billion per year in new state resources, or $2 billion per biennium.

According to the March 2024 outlook, the corporate activity tax is expected to generate around $2.8 billion during the current 2023-25 biennium. Strong consumer spending and the inflationary environment have both played roles in the large amount of collections.

Given the lack of historical experience, the outlook for the corporate activity tax remains uncertain. However, since the CAT is a tax on consumption, collections will prove to be less volatile than Oregon's dominant income taxes over time. The baseline outlook for tax liability is currently based on expected output growth across various industries as well as growth in consumer spending.

The outlook for CAT collections is further complicated by lags in filing and the processing of tax returns. Only in January of this year was return data for the 2021 tax year made available. Also, the pattern of collections changed drastically in 2021, with firms being allowed to file returns based on their own fiscal years rather than on a uniform April filing deadline. In addition, as a new tax, the number of CAT filers continues to grow as more firms are made aware of their liability.
The evolving pattern of CAT collections combined with a larger estimated beginning balance have combined to drive an increase in expected revenues relative to the December 2023 forecast.

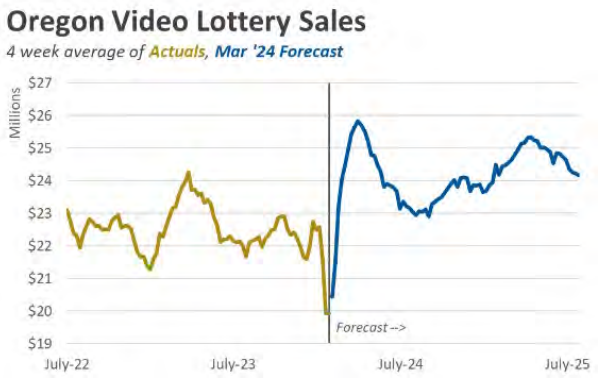
In the December 2023 forecast, expected CAT revenues were revised downward due to a steep decline in advanced tax payments. As additional data has become available, it has become clear that this decline was driven by an evolving pattern of payments rather than by a fundamental drop in underlying tax liability. In recent months, advanced tax payments have been replaced by filers applying the refunds that they are owed to future tax years. As a result, for the current 2023-25 budget period, the outlook for CAT collections has been increased by $43.4 million. The revenue forecast for future tax years have been revised upwards as well.

Table B.12 in Appendix B summarizes the 10-year forecast and the allocation of resources, while Table B.13 presents a more detailed quarterly breakdown of the forecast. The personal income tax reductions are built into the General Fund forecasts shown in Tables B.1 and B.2.

Lottery Forecast

Overall, total lottery resources are lowered by slightly in the current 2023-25 biennium, and increased in the future biennia relative to the previous forecast.

Near-term there are four changes to the 2023-25 forecast. The forecasts for both traditional lottery and sports betting are increased due to both stronger sales than forecasted, and an improved outlook. These increases are more than offset by a downward adjustment to the video lottery forecast.



In particular the recent ice storms, like previous extreme weather events, resulted in very low levels of sales as Oregonians were sheltering at home and getting out less. While not a long-run issue, or change in player behavior, a couple weeks of low sales does impact the revenue forecast. That said, sales were a bit below forecast in November as well, even as December sales met forecast.

Looking forward, the Lottery outlook calls for record video lottery sales in the coming months in part due to the ongoing strength in the economy, and in addition to the record $5.6 billion Oregon personal income tax kicker being paid out this tax filing season. Oregonians will spend some portion of the kicker on discretionary purchases be it going out to eat, on exercise equipment, on vacations, on gaming, or any other number of possibilities. The forecast continues to assume the normal share of personal income is spent on video lottery. As such, the historically large kicker presents both upside and downside risks to the near-term forecast. Should Oregonians choose to spend more of their disposable income gains on gaming, Lottery sales are likely to be above the baseline outlook, on the other hand should inflation take its toll on household budgets, or should Oregonians choose to disproportionately spend their kicker credits on other items, then sales may be below the baseline.

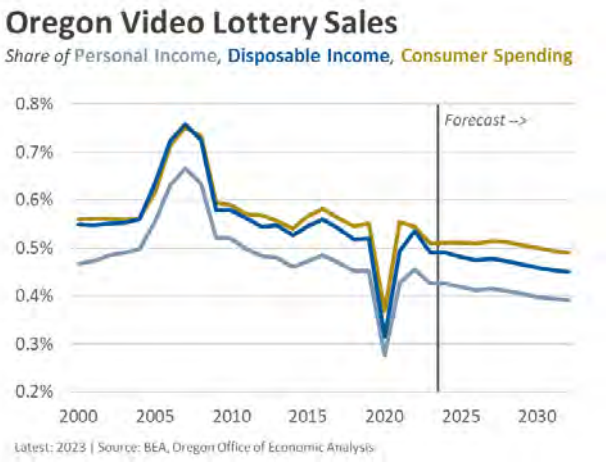
On net, between traditional, video, and sports betting, Lottery *revenues* for 2023-25 are lowered $7.1 million relative to the December 2023 forecast. However this reduction is nearly offset by reversions in the Economic Development Fund, which is where Lottery transfers go before being distributed to recipient programs, as accountants closed the books on the previous 2021-23 biennium. There were $5.7 million Lottery (EDF) reversions, meaning the net change to 2023-25 available resource is a reduction of $1.4 million.

Longer-Term Outlook

At a base level, forecasting Lottery revenues comes down to the number of players and their household budgets. Those are relatively straightforward, and Lottery trends generally follow the overall economy even if it is not a one to one relationship. However, Lottery revenues really are about consumer preferences for entertainment, and how they spend their disposable income. Do Oregonians choose to go out to eat more, or on vacations, or to sporting events, or even to destination-based gaming at tribal casinos or on trips to Las Vegas and the like?

As such, the big picture issues our offices monitors include the broader national trends in gaming markets, demographic preferences for recreational activities, and to what extent consumers increase the share of their incomes spent on gaming.

For much of last decade, consumers remained cautious with their disposable income. Increases in spending on gaming largely matched income growth at best. In fact, from 2010 to 2019, Oregon video lottery sales grew at a 3.7 percent annual pace, while Oregon personal income increased at a 5.3 percent annual pace. Lottery sales as a share of overall Oregonian consumer spending declined. This slow erosion is also seen in terms of the number of video lottery retailers, and Lottery revenues as a share of the state's All Funds budget.

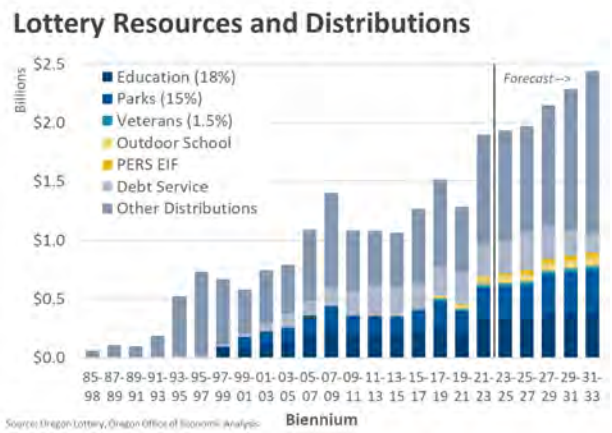


Trends in gaming during the pandemic differed significantly for a period of time. When bars and restaurants were takeout only, video lottery terminals were turned off as to not have Oregonians indoors when a deadly, contagious virus was spreading. Once the health restrictions were lifted, sales returned in full-force, and significantly outstripped expectations. These sales also outpaced current income games. Some of the strong sales since reopening were due to pent-up demand, strong household finances, and the fact that other entertainment options were either not available initially (concerts, spectator sports) or possibly less desirable due to the virus (long distance travel, movie theaters).

Since reopening, it has been an open question to what extent some of those relatively strong sales were part of a more permanent change in player behavior, or were just temporary, pandemic era changes. Over the past year or two it has become increasingly clear that the pandemic sales were more of a temporary change as sales have come off their peak and not kept up with income gains. Today, video lottery sales as a share of personal income is at its lowest point in decades.

Looking forward, our office expects increased competition for household entertainment dollars, increased competition within the gaming industry, and potentially shifts in generational preferences and tastes when it comes to gaming. As such, our outlook for video lottery sales is continued growth, however at a rate that is slightly slower than overall personal income growth. Lottery sales will continue to increase as Oregon's population and economy grows, however video lottery sales will likely be a slightly smaller slice of the overall pie.

The March 2024 forecast is not qualitatively different than previous outlooks. These same broad trends are apparent today as they were last quarter. However, updated player demographic information, alongside new modeling raises the long-term outlook slightly in future biennia. In 2025-27 the forecast change is +$8.2 million, in 2027-29 it is +$35.1 million, in 2029-31 it is +$35.7, and in 2031-33 it is +$46.1 million.



For more information on player demographics and the impact of the aging population, see the March 2023[6] forecast.

The full extended outlook for lottery earnings can be found in Table B.9 in Appendix B.

Budgetary Reserves

The state currently administers two general reserve accounts, the Oregon Rainy Day Fund[7] (ORDF) and the Education Stability Fund[8] (ESF). This section updates balances and recalculates the outlook for these funds based on the December revenue forecast.

As of this forecast the two reserve funds currently total a combined $2.2 billion. At the end of the current 2023-25 biennium, they will total $2.9 billion, which is equal to 11.2 percent of current revenues. Including the projected General Fund ending balance of $1.7 billion, the total effective reserves at the end of the current 2023-25 biennium are projected to be $4.5 billion, or 17.6 percent of current revenues.

The forecast for the ORDF includes two deposits for this biennium relating to the General Fund ending balance from the previous biennium (2021-23). A deposit of $264.7 million will be made in early 2024 after the accountants closed the books on last biennium. Additionally, a $98.9 million deposit relating to the increased corporate taxes from Measure 67 is expected at the end of the biennium in June 2025. This exact transfer amount is subject to some revision as corporate filings are processed, however the transfer itself will occur. At the end of 2023-25 the ORDF will total $1.9 billion.

[6] https://digital.osl.state.or.us/islandora/object/osl%3A1007538/datastream/OBJ/view

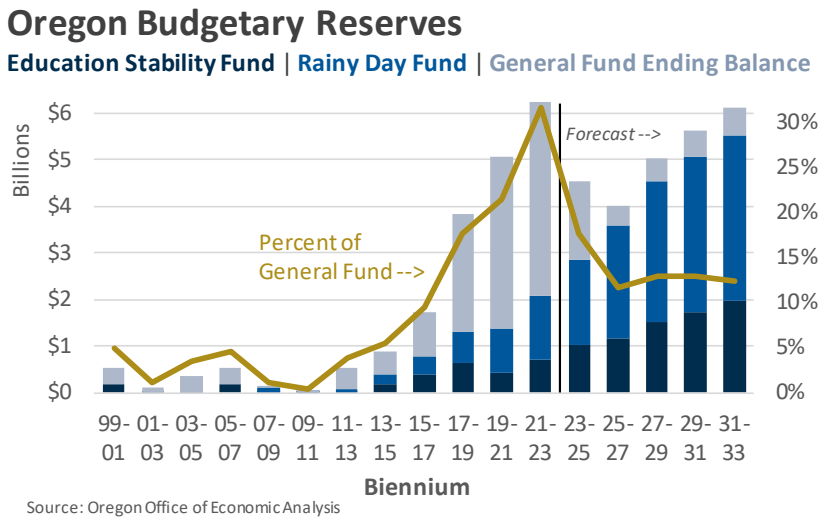
[7] The ORDF is funded from ending balances each biennium, up to one percent of appropriations. The Legislature can deposit additional funds, as it did in first populating the ORDF with surplus corporate income tax revenues from the 2005-07 biennium. The ORDF also retains interest earnings. Withdrawals from the ORDF require one of three triggers, including a decline in employment, a projected budgetary shortfall, or declaration of a state of emergency, plus a three-fifths vote of the Legislature. Withdrawals are capped at two-thirds of the balance as of the beginning of the biennium in question. Fund balances are capped at 7.5 percent of General Fund revenues in the prior biennium.

[8] [8] The ESF gained its current reserve structure and mechanics via constitutional amendment in 2002. The ESF receives 18 percent of lottery earnings, deposited on a quarterly basis – 10% of which are deposited in the Oregon Growth sub-account. The ESF does not retain interest earnings. The ESF has similar triggers as the ORDF, but does not have the two-thirds cap on withdrawals. The ESF balance is capped at five percent of General Fund revenues collected in the prior biennium.

Looking ahead to the 2025-27 biennium, the ORDF is not projected to hit its cap of 7.5 percent of revenues early in calendar year 2026. Back in the September 2023 forecast it was expected to hit the cap in 2026, but in the December 2023 forecast, and in the current March 2024 forecast, the cap is not expected to be reached. In the current forecast, the ORDF will be at 7.36 of the previous biennium's revenues at the time of the expected transfer. That leaves a $36 million difference between 7.36 and 7.5 percent. As the forecast and actual revenues and interest earnings change over the next couple of years, the ORDF may or may not reach that cap. Our office will adjust the outlook accordingly. Should the cap be reached, then the ending balance transfer would not occur, and those revenues would be retained in the General Fund to be appropriated by policymakers. Today, the ORDF is not expected to reach its cap and not make the ending balance transfer until FY2030, and then again in FY2032.

The ESF will receive an expected $298.7 million in deposits in the current 2023-25 biennium based on the current lottery forecast. At the end of current 2023-25 biennium the ESF will stand at $1.0 billion. The ESF is projected to hit its cap of 5 percent of revenues early in calendar year 2026, when the deposits will then accrue to the Capital Matching Account.

Together, the ORDF and ESF are projected to have a combined balance of $2.9 billion at the close of the 2023-25 biennium, or 11.2 percent of current revenues. At the close of 2025-27 the combined balance will be $3.6 billion, or 10.4 percent of revenues. Such levels of reserve balances are larger than Oregon has been able to accumulate in past cycles, and should help stabilize the budget when the next recession hits.



Source: Oregon Office of Economic Analysis

Effective Reserves ($ millions)

	Current Jan-24	*End of 2023-25*
ESF	$790	$1,007
RDF	$1,386	$1,859
Reserves	$2,175	$2,867
Ending Balance	$1,656	$1,656
Total	**$3,832**	**$4,523**
% of GF	14.9%	17.6%

Even with a higher probability of the economic soft landing, and a lower probability of recession today, should a boom/bust cycle occur, the state would be expected to meet the trigger for withdrawals at that time. In particular the reserve fund trigger of two consecutive quarters of employment declines would be expected to be met based on our office's alternative scenario of a moderate recession. The other triggers may or may not be met. If revenues come in below forecast this biennium, that could trigger a potential withdrawal. And for the ESF only, not the ORDF, a Governor's declaration of emergency could also trigger a potential withdrawal.

Finally, these are the technical considerations for using the reserve funds. Ultimately policymakers will decide whether to use the funds or not. Regardless of the trigger(s) met, the Legislature would need a three-fifths vote in each chamber to approve an ESF reserve fund withdrawal and a simple majority vote in each chamber to approve an ORDF withdrawal.

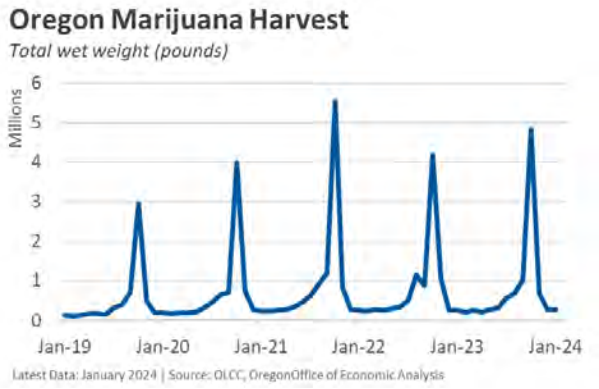
B.10 in Appendix B provides more details for Oregon's budgetary reserves.

Recreational Marijuana Forecast

Available resources in the current 2023-25 biennium are lowered $7 million (-2.2%) relative to the previous forecast. Future biennia are all lowered by $6-9 million as well, for a 1.5 to 2% reduction when compared to the December 2023 forecast.

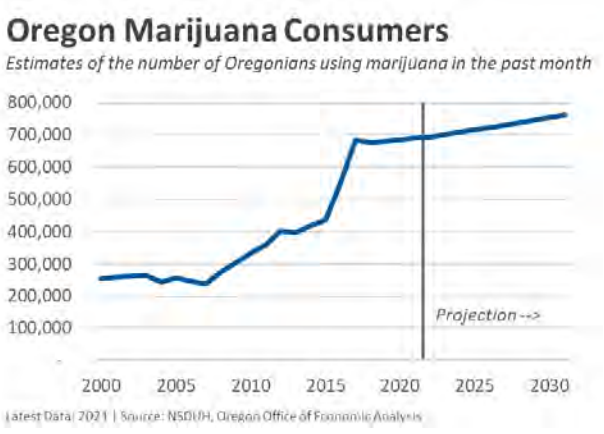
The basis for the lower forecast is the combination of sales coming in slightly below expectations, and ongoing weak prices. Encouragingly from an industry perspective, on a price-adjusted basis, usable marijuana sales are increasing again indicating the volumes sold is picking up following the pandemic boom and mini-bust.

However, not so encouraging from an industry perspective remains the large harvest last year that will keep downward pressure on prices in the year(s) ahead.



Given these market conditions of oversupply, firm saturation, and stable consumer demand, low prices make it difficult for businesses to be profitable. Additionally, they impact tax collections as well given Oregon levies its recreational marijuana tax based on the price of the products, plus the potential for delinquent taxes owed.

Looking forward, the low-hanging fruit for consumer demand growth is behind us. Marijuana usage rates are steady in recent years, after increasing considerably in the past decade. Note that the latest annual usage data will be released prior to the next forecast. Our office will include the new numbers at that time, along with an update to our estimates of the number of marijuana consumers in Oregon based on those usage rates.



Additionally, many former black market consumers have converted to the legal market, and those that remain may be harder to switch. And underlying population growth has slowed during the pandemic, with only a modest rebound expected in the

outlook. Given the age profile of marijuana users and our office's demographic forecast, our office's projection for the number of marijuana consumers in the state is expected to increase slightly faster than the overall population in the decade ahead. Total population is forecasted to increase 0.6 percent per year, while the marijuana consumer base is projected to increase 1.0 percent per year. While that growth will result in more sales, and more tax collections, faster gains will only be seen once industry pricing power returns.

See Table B.11 in Appendix B for a full breakdown of revenues and associated distributions to recipient programs.

Psilocybin Forecast

Ballot Measure 109 which voters passed in 2020 and legalized psilocybin, tasked our office with the revenue forecasting responsibilities. The current forecast remains unchanged from last quarter, however there is a large likelihood the revenue forecast will be revised lower, possibly significantly so, in the near future. While there has always been the expectation that a new program would ramp up over time as businesses get set up, consumers try it, and broader social acceptance and usage rises. Even so, through the first six months of the biennium, actual tax collections are minimal. As more data and quarterly tax returns become available, our office will adjust the outlook accordingly.

After speaking with other state agencies and private businesses entering the psilocybin industry there are a few important items to note up front.

First, the overall cost of a session to a customer is expected to be in the hundreds, and even thousands of dollar range. Second, the state's 15 percent retail sales tax which was part of BM109 only applies to the product itself and not the overall cost of the session. Third, by all accounts the cost of the product is relatively small compared to the overall cost of a session, where the vast majority of the revenue will go to cover the operational costs of the service center and facilitator.

This newly legal industry is just getting started. The Oregon Health Authority has recently issued some of the first licenses in the state. Once the industry is up and running, OHA will gather data, including the number of sessions, product prices and the like. Unfortunately for now there is no data and our office's initial forecasts are based entirely on assumptions. Those assumptions are as follows.

OHA estimates they will license 28 service centers in the first year. Assuming 20 customers per day, the equivalent of one large class, all year long results in 204,000 individual customers or session over the course of the first year. Some service center centers will accommodate many more customers while others may focus on smaller, more in-depth sessions. Anecdotal information to date indicates the first couple of service centers are serving just a handful of customers per week currently.

As uncertain as those projections are, the average product price assumption is even more so. Service centers may charge customers whatever price they want to for the actual product. There are two main ways to think through these possibilities, and for now our office is taking a middle ground approach.

On one hand, service centers may charge customers the traditional retail price that includes a markup over wholesale cost which largely relates to production, testing, and distribution costs. Whether the sales tax piece would be an additional charge on top of the session costs overall, or already factored that price is unknown. Tax revenues are estimated to be $1-2 million per year under these scenarios.

On the other hand, service center may charge customers a minimal product cost of $1 or $10, even if that is below their wholesale or acquisition costs. The benefit to doing so would be to increase revenues and profits for service centers and facilitators as less of the overall session price would be sent to pay taxes. This is more likely to be the case if the sales tax is folded into the total session price initially and not an add-on fee when the customer pays. Tax revenues are estimated to be tens of thousands or hundreds of thousands of dollars a year under these scenarios.

Oregon Psilocybin Retail Sales Tax Revenue

Average Product Price	Biennial Revenue (millions) 2023-25	2025-27	2027-29	2029-31
$1	$0.062	$0.064	$0.067	$0.068
$10	$0.618	$0.643	$0.666	$0.679
$25	$1.545	$1.608	$1.664	$1.698
$50	$3.091	$3.215	$3.329	$3.396

For now, given the uncertainty of a newly legal industry our office is taking a middle ground approach and assuming a $10 average product price per session. The state is likely to receive a bit more than $600,000 in the current 2023-25 biennium based on the assumptions discussed above. We know that business practices will vary and time will tell what ultimately becomes the industry standard. Our office will continue to update these estimates as we learn more. Expectations are by this fall there will be useful data to help guide these estimates and they will not be made entirely upon assumptions.

Population and Demographic Outlook

Population and Demographic Summary

Oregon's resident population count on April 1, 2020 was 4,237,256. This is from the newly released decennial census data administered by the U.S. Census Bureau. During the past decade, Oregon gained 406,182 residents or 10.6 percent. The gain was substantial enough that yielded one additional congressional seat for the state. Oregon now has a total of six members in the House of Representatives. We have been predicting this rare gain for a long time. This is rare because it took 40 years for Oregon to gain this seat and only five states gained one additional seat each and Texas gained two seats following the 2020 Census.

In Historical context, Oregon's population growth rate between the 2010 and 2020 censuses was the second lowest since the first census count in Oregon in 1860 after gaining statehood. The lowest growth rate was recorded between the 1980 and 1990 censuses, a decade characterized by a major recession. Oregon's population increased by 441 percent in the last century spanning 1920-2020. The gain of 406,182 persons in the last decade alone was nearly the same as the total population count of Oregon in the year 1900 when the state had 413,536 residents. Oregon's population growth of 10.6 percent in the last decade was 11th highest in the nation, excluding Washington D.C. Still, our growth rate for the decade lagged all our neighboring states, except California. During the prior decade between 2000 and 2010, Oregon's population growth rate ranked 18th highest in the nation when Oregon was hit hard by the double recessions during the decade. As a result of such economic downturn during the Great Recession and sluggish recovery that followed, Oregon's population increased at a slow pace between 2000 and 2010 decade. However, Oregon's population was showing moderately strong growth since then because of state's strong economic recovery. The recent COVID-19 pandemic has caused dire economic and employment situations and has caused slow population growth. The population growth is expected to rebound after the year 2023. However, current economic turmoil is likely to slow the pace of expected growth. The average population growth between 2021 and 2023 was lowest since 1985-86. Oregon's population is expected to reach 4.547 million in the year 2033 with an annual rate of growth of 0.6 percent between 2023 and 2033.

Oregon's economic condition heavily influences the state's population growth. Its economy determines the ability to retain existing work force as well as attract job seekers from national and international labor market. As Oregon's total fertility rate remains well below the replacement level and number of deaths continue to rise due to aging population, long-term growth comes from net in-migration. The COVID-19 pandemic has left noticeable impact on demographic processes. Due to the declining births and rising deaths, past forecasts projected natural increase (births minus deaths) to turn negative after the year 2025. However, Oregon's natural increase has already turned negative because of the COVID effect. Even during this pandemic, Oregon gained people through net-migration as the workers are able to work from home in many sectors. Working-age adults come to Oregon as long as we have favorable economic conditions and offers better quality of life. During the 1980s, which included a major recession and a net loss of population during the early years, net migration contributed to 22 percent of the population change. On the other extreme of the economic cycle, net migration accounted for 73 percent of the population change during the booming economy of early 1990s. This share of migration to population change declined to 25 percent in 2010-11 as a result of the economic recession, lowest since early 1980s when we had negative net migration for several years. As a sign of slow to modest

economic gain and declining natural increase (excess of deaths over births), the ratio of net migration-to-population change has registered at 90 percent in 2020. As a result of sudden rise in the number of deaths and drop in the number of births coinciding with the COVID-19 pandemic, the natural increase turned negative starting in the year 2020 and will continue through 2033 and beyond. So, in the future, all of Oregon's population growth and more will come from the net migration due to the combination of continued positive net migration, well below replacement level fertility, and the rise in the number of deaths associated with the increase in the elderly population. Thus, migration will be solely responsible for Oregon's future population growth. Without the gain due to migration, Oregon's population will start to decline. The negative natural increase caused by excess of deaths over births is expected to continue. However, under a few scenarios this trend may reverse itself. Such reversal can happen if the women start to have more children due to behavioral or motivational factors, or mortality and life expectancy improve suddenly resulting in fewer deaths or large number of women in childbearing age move into Oregon. Since all the states in the country are already experiencing below replacement level fertility (2.1 children per woman), the natural increase will eventually turn negative nationwide even if the trend is mitigated for the short term because of the large number of women in childbearing age.

Age structure and its change affect employment, state revenue, and expenditure as the demand for services varies by age groups. Demographics are the major budget drivers, which are modified by policy choices on service coverage and delivery. Births, deaths, and migration history of decades past do impact the current age-sex structure. Growth in many age groups will show the effects of the baby-boom and their echo generations during the forecast period of 2023-2033. It will also reflect demographics impacted by the depression era smaller birth cohort combined with changing migration of working age population and elderly retirees through history. After a period of relatively slow growth during the 1990s and early 2000s, the elderly population (65+) has picked up a faster pace of growth since 2005. The high growth of this population will taper off as the tail end of the baby era birth cohort enter this age group. This age cohort, however, has hit the plateau of high growth rates exceeding 4 percent annually between 2011 and 2019. The group will experience continued high but diminishing rate of growth. The average annual growth of the elderly population will be 1.6 percent during the 2023-2033 forecast period. Different age groups among the elderly population show quite varied and fascinating growth trends. The youngest elderly (aged 65-74), which was growing at an extremely fast pace in the recent past averaging 5.1 percent annually between 2010 and 2020 due to the direct impact of the baby-boom generation entering and smaller pre-baby boom cohort exiting this 65-74 age group. This fast-paced growth rate will taper off to negative growth by the end of the forecast period of 2023-2033 as a sign of the end of the baby-boom generation transitioning to elderly age group. This high growth transitioning into a net loss of this youngest elderly population resulting in -0.5 percent annual average loss in the coming ten years. The next older generation of population aged 75-84 has been growing rapidly for a decade after several years of slow growth and a period of shrinking until a decade ago. The elderly aged 75-84 started to show growth as the effect of depression era birth-cohort matured out of this age group. An unprecedented fast pace of growth of population in this age group has already started as the baby-boom generation is maturing from the youngest elderly into and depression era birth cohort exiting this 75-84 age group. Annual growth rate during the forecast period of 2023-2033 is expected to be unusually high 3.8 percent. However, during the first half of the forecast period, the annual growth rate will exceed 4 percent per year. The oldest elderly population (aged 85+) will resume growth at a strong rate steadily gaining momentum due to the combination of cohort change, continued positive net migration, and improving longevity. The average annual rate of growth

for this oldest elderly over the forecast horizon will be 4.9 percent. An unprecedented growth in oldest elderly will commence near the end of the forecast horizon as the fast growing 75-84 age group population transition into this oldest elderly age cohort. As a sign of massive demographic structural change of Oregon's population, starting in 2023 the number of elderly will exceed the number of children under the age of 18. To illustrate the contrast, in 2000 elderly population numbered a little over half of the number of children in Oregon, now the elderly outnumber the children.

The oldest working age population aged 45-64 also has seen the dramatic demographic impact as the baby-boom generation matures out of the oldest working-age cohort which is replaced by smaller baby-bust cohort or Gen X. As the effect of this demographic transition combined with slowing net migration, the once fast-paced growth of population aged 45-64 has gradually tapered off to below zero percent rate of growth by 2012 and has remained at slow or below zero growth phase until now. The growth rate will reverse to positive and will see slowly gaining momentum over the forecast horizon. The size of this older working-age population will see about 0.9 percent annualized rate of change over the forecast horizon of next ten years. The younger working-age population of 25-44 age group had recovered from several years of declining and slow growing trend. However, the slow growth of this young working-age population will continue throughout the forecast period. This group will increase by 0.4 percent annual average rate during the forecast horizon mainly because of the exiting smaller birth (baby-bust) cohort being replaced by slightly larger baby-boom-echo cohort. The young adult population (aged 18-24) will see only a small change over the forecast period due to the combination of negative and slow growth years. Although the slow growth of college-age population (age 18-24), in general, tend to ease the pressure on public spending on higher education, but college enrollment typically goes up during the time of very competitive job market, high unemployment, and scarcity of well-paying jobs when even the older people flock back to colleges to better position themselves in a tough job market. The growth in K-12 population (aged 5-17) has been very slow or negative in the past and is expected to decline through the forecast years. This will translate into slow growth or decline in the school enrollments. On average for the forecast period, this school-age population will decline by -1.1 percent annually. The growth rate for children under the age of five has remained near or below zero percent in the recent past and will continue negative or slow growth the near future due to the sharp decline in the number of births. We expect a rebound in the number of births in the forecast period due to a small increase in fertility rate and increase in the women in the child-bearing ages. During the forecast horizon, the children under the age of five will increase at the rate of 0.5 percent annually. Although the number of children under the age of five declined in the recent years, the demand for childcare services and pre-Kindergarten program will be additionally determined by the labor force participation and poverty rates of the parents.

Overall, elderly population over age 65 will increase rapidly whereas the number of children will decline over the forecast horizon. The number of working-age adults in general will show slow growth during the forecast horizon. Hence, based solely on demographics of Oregon, demand for public services geared towards children and young adults will likely decline or increase only at a slower pace, whereas demand for elderly care and services will increase rapidly.

Procedure and Assumptions

Population forecasts by age and sex are developed using the cohort-component projection procedure. The population by single year of age and sex is projected based on the specific assumptions of vital events and migrations. Oregon's estimated population of July 1, 2020 based on the most recent

decennial census is the base for the forecast. To explain the cohort-component projection procedure very briefly, the forecasting model "survives" the initial population distribution by age and sex to the next age-sex category in the following year, and then applies age-sex-specific birth and migration rates to the mid-period population. Further iterations subject the in-and-out migrants to the same mortality and fertility rates. Hence, the age-sex group we start with become one year older the next year accounting for the deaths during the year, births to the women in childbearing ages, and add/subtract net migration for that age during the year.

The U.S. Census Bureau has released the age-sex details of the resident population count of April 1, 2020 for the states. This is the crucial information as the base for all future postcensal population estimates and projections. The 2020 census population total and age-sex detail are used to determine the error of closure, which is the difference between the actual census enumeration and the estimate based on the previous census of 2010. Again, the error of closure is used to correct and adjust all previous annual postcensal estimates for the time between 2011 and 2019. OEA has estimated the total intercensal population for Oregon based on 2010 and 2020 census counts and postcensal estimates of Population Research Center, Portland State University. Therefore, Oregon's *intercensal* population estimates for the years 2011 through 2019 in this forecast shown in Appendix C are different from prior *postcensal* numbers and PSU's original estimates. The Bureau released age-sex detail of the census population in June of last year. OEA has produce preliminary readjusted intercensal estimates by age and sex for each of the years from 2011 through 2019. The numbers of births and deaths through 2022 are from Oregon's Center for Health Statistics. All other numbers and age-sex detail are generated by OEA.

Annual numbers of births are determined from the age-specific fertility rates projected based on Oregon's past trends and past and projected national trends. Oregon's total fertility rate is assumed to be 1.4 per woman in 2020 and this rate is projected to 1.5 children per woman by 2033 which is well below the replacement level fertility of 2.1 children per woman. Oregon's fertility level is tracking below the national level.

Life Table survival rates are developed for the year 2020. Male and female life expectancies for the 2020-2033 period are projected based on the past three decades of trends and national projected life expectancies. After a sudden decline during the COVID pandemic, gradual improvements in life expectancies are expected over the forecast period. At the same time, the difference between the male and female life expectancies will continue to shrink. The male life expectancy at births of 77.3 and the female life expectancy of 81.8 in 2010. Due to the effect of the COVID-19 pandemic, number of deaths suddenly increased and the actual life expectancies declined. The life expectancy at birth in 2020 was 76.9 and 81.7 years respectively for males and females. This is expected to improve to 78.4 years for women and 83.1 years for men by 2033.

Estimates and forecasts of the number of net migrations are based on the residuals from the difference between population change and natural increase (births minus deaths) in a forecast period. The migration forecasting takes into account Oregon's employment, unemployment rates, income/wage data from Oregon and neighboring states, past trends and migration to population ratio. Distribution of migrants by age and sex is based on detailed data from the American Community Survey. In the recent past, slowdown in Oregon's economy resulted in smaller net migration and slow population growth. Estimated population growth and net migration rates in 2010-2011 were the lowest

in over two decades. Migration is intrinsically related to economy and employment situation of the state. Still, high unemployment and job loss in the recent past have impacted net migration and population growth, but not to the extent in the early 1980s. Main reason for this is the fact that other states of potential destination for Oregon out-migrants were not faring any better either, limiting the potential destination choices. The role of net migration in Oregon's population growth will get more prominence as the natural increase has begun to turn negative. The increasing excess of deaths over births will continue due to the rapid increase in the number of deaths associated with the aging population and relatively fewer number of births largely due to the decline in fertility rate associated with life-style choices. Such a trend was expected, but the COVID-19 has hastened the process. The annual net migration is expected to be low due to the after-effect of COVID-19 like remote working and economic slowdown. However, the migration is expected to recover after 2024. Between 2023 and 2033 net migration is expected to be in the range of 24,140 to 36,150, averaging 32,800 persons annually with net migration rate ranging between 5.61 to 7.98 per thousand population.

Estimated Ending Balance	442,833,142			1,097,849,728			1,656,305,681	558,455,953	1,213,472,539

Notes: Corporate income tax figure includes Corporate Multistate taxes. Other taxes include General Fund portions of the Eastern Oregon Severance Tax, Western Oregon Severance Tax and Amusement Device Tax. Cigarette, Other Tobacco, and Liquor are the General Fund portions only, see Table B.6 and B.7 for more.

* The Anticipated Administrative Actions line includes items like Tax Anticipation Note borrowing costs. None of these costs are anticipated for the 2023-25 biennium.
** "Statutory Transfers" amounts to the $264.7 million Rainy Day Fund transfer and the return of $19.8 million in unexpended balance from the Department of Agriculture per SB 892 (2021 second special session). The BM 110 Transfer that was included for the Close of Session forecast is now included in the PIT "Transfers and Offsets" line. The amount of the BM 110 transfer is $2,157,766 in FY 2024 and $37,512,017 in FY 2025.

Note: Some totals may not foot due to rounding.

1. Sports Betting revenues are transferred to Economic Development Fund making them subject to the constitutional distributions, after which the remainder is transferred to the Employer Incentive Fund
2. Includes reversions (unspent allocations from previous biennium) and interest earnings on Economic Development Fund.
3. Eighteen percent of proceeds accrue to the Ed. Stability Fund, until the balance equals 5% of GF Revenues. Thereafter, 15% of proceeds accrue to the School Capital Matching Fund.
4. The Parks and Natural Resources Fund Constitutional amendment requires 15% of net proceeds be transferred to this fund.
5. Per Ballot Measure 96 (2016), 1.5% of net lottery proceeds are dedicated to the Veterans' Services Fund
6. Per Ballot Measure 99 (2016), the lesser of 4% of Lottery transfers or $22 million per year is transferred to the Outdoor Education Account. Adjusted annually for inflation.
7. Approximately one percent of net lottery proceeds are dedicated to each program. Certain limits are imposed by the Legislature.
8. Includes Debt Service Allocations, Allocations to State School Fund and Other Agency Allocations

(Millions)	2021-23	2023-25	2025-27	2027-29	2029-31	2031-33
Ending Balances	**$2,064.2**	**$2,866.5**	**$3,577.9**	**$4,548.9**	**$5,076.6**	**$5,504.6**
Percent of General Fund Revenues	6.7%	11.2%	10.4%	11.7%	11.6%	11.1%

Footnotes:

1. Includes transfer of ending General Fund balances up to 1% of budgeted appropriations as well as private donations. Assumes future appropriations equal to 98.75 percent of available resources. Includes forecast for corporate income taxes above rate of 6.6% for the biennium are deposited on or before Jun 30 of each odd-numbered year.
2. Available funds in a given biennium equal 2/3rds of the beginning balance under current law.
3. Excludes funds in the Oregon Growth and the Oregon Resource and Technology Development subaccounts.
4. Interest earnings are distributed to the Oregon Education Funds (75%) and the State Scholarship Fund (25%), provided there remains debt outstanding. In the event that debt is paid off, all interest earnings distributed to the State Scholarship Fund.
5. Contributions to the ESF are capped at 5% of the prior biennium's General Fund revenue total. Quarterly contributions are made until the balance exceeds the cap.

Note: Some totals may not foot due to rounding.

1. Retailers pay taxes monthly, however taxes are not available for distribution to recepient programs until the Department of Revenue receives and processes retailers' quarterly tax returns. As such, there is a one to two quarter lag between when the initial monthly payments are made and when monies be come available to distribute.

2. Medical marijuana being exempt from tax is an explicit tax expenditure per HB 2433 (2021). Tax expenditures sunset after 6 years, although they may be renewed at that time. Current law is that medical marijuana sales will be taxed beginning January 1, 2028.

3. Administrative Costs reflect monthly collection costs for the Department of Revenue in addition to distributions to the Criminal Justice Commission and OLCC per SB 1544 (2018)

4. The first $11.25 million per quarter ($45m per year) is distributed via forumula to the initial recipient programs. These distributions are adjusted for inflation. All additional revenues go to the Drug Treatment & Recovery Fund.

Note: The State School Fund distribution equals an estimate of the lost General Fund due to the Personal and Corporate Income Tax changes enacted in HB 3427. In addition, each biennium includes an additional $40 million dedicated to the High Cost Disabilities Account. The 2021-23 distribution equals the Legislatively Adopted Budget Other Fund limitation. The 2023-25 distribution includes a $30.46 million reconciling adjustment for the prior biennium.
Some totals may not foot due to rounding.

APRIL 2021

To work from home or not to work from home? That is the question

Maya B. Brandon

The coronavirus disease 2019 (COVID-19) era has ushered in a new look and feel for the workplace. With the fear of infection, of self or loved ones, many people are breathing a sigh of relief with the expansion of permissions to work from home, whereas others are holding their breath in the aftermath of widespread lockdowns and economic uncertainty. In "Who should work from home during a pandemic? The wage-infection trade-off" (National Bureau of Economic Research, Working Paper 27908, October 2020), authors Sangmin Aum, Sang Yoon (Tim) Lee, and Yongseok Shin explore an optimal policy: "the economic costs of containing a pandemic can be minimized by only sending home those jobs that are highly exposed but easy to perform from home."

How we think about interacting with others, avoiding illness, and establishing a new normal are top subjects today. In many cases, people must weigh the risks of exposure and infection against the benefits of wages. We assume that with these widespread health disparities, the workplace is a breeding ground of infection and shutting it down will reduce infection. Actions to contain pandemic-level contagions often require the cooperation of people at multiple levels, but these actions come at a cost, especially to low-wage workers who are "bearing the brunt of the pandemic economically and in terms of infection risks." Businesses and workers have difficult choices to make, and these choices come with a laundry list of economic, social, and health tradeoffs.

Many workers are safely able to work from home during the pandemic, but many are not. Aum, Lee, and Shin have constructed two indexes—one of occupational exposure risk and another of time spent working from home. Their indexes use data from O*NET (the Occupational Information Network that is the primary source of occupational information for the United States), the American Time Use Survey, and the American Community Survey to find that jobs with workers who have less ability to work from home and higher exposure to infection are not tightly correlated. "Infection risks vary widely even among jobs with the same WFH [working from home]: for example, neither medical therapists nor experimental physicists can work from home, but the latter pose almost no risk of contagion." The authors argue that the ability to work from home is not the be-all and end-all for who should work from home, because the nature of the work and possibility of exposure should also be considered. Jobs have been classified as essential or nonessential. These classifications, however, are too broad because the scope of work and the exposure risk better indicate who should be allowed to work from home on the basis of need. The authors report that closing and locking down all businesses are more harmful economically at micro- and macrolevels than operating under the optimal policy of sending home workers who have jobs that are highly exposed but easy to perform from home.

In the face of widespread business closures, high levels of exposure to the COVID-19, and uncertainty of employment, low-wage workers have been greatly affected globally by the lockdowns. High-wage workers have been less affected by the lockdowns and continued to work with modifications and increased options to telework. Aum, Lee, and Shin's optimal policy provides a realistic view of the job world during the COVID-19 pandemic but uses a conceptual view of the real world. Their goal is to provide a blueprint for pandemic lockdowns that is simple, implementable, and optimal for workers, employers, and the overall economy.

Measuring industry employment, 1990–2018: a look at the auxiliary-unit concept

The North American Industry Classification System (NAICS) replaced the Standard Industrial Classification (SIC) system in 1997. Since the change, some analysts have expressed concerns about the elimination in NAICS of the concept of auxiliary units, which are now classified with other worksites that perform similar functions. This article examines how employment trends by broad industry groups would have differed over the past few decades if the auxiliary-unit concept had been used to estimate employment in those units as it was in the SIC system.

Kenneth W. Robertson
robertson.ken@bls.gov

Kenneth W. Robertson is the Assistant Commissioner of the Office of Industry Employment Statistics, U.S. Bureau of Labor Statistics.

In the United States, Canada, and Mexico, businesses (and hence business employment) are classified and reported in industries according to the North American Industry Classification System (NAICS).[1] NAICS was implemented in the United States in 1997, replacing its predecessor, the Standard Industrial Classification (SIC) system. A major criticism of this change, over time, has involved the treatment of auxiliary units. In the SIC system, an auxiliary unit was defined as a worksite that was part of a firm and provided management or support services for other worksites within the firm. At the U.S. Bureau of Labor Statistics (BLS), in practice, this meant that an auxiliary unit was a worksite reported with other worksites as part of a multiworksite unemployment insurance account. Typical examples of auxiliary units include headquarters and warehouses associated with a manufacturing plant. Under NAICS, the auxiliary-unit concept was eliminated, and these units are now classified with other worksites performing similar functions.[2]

In this article, I use data from the BLS Quarterly Census of Employment and Wages (QCEW) to look at how employment trends over the past few decades would differ if we were to approximate the auxiliary-unit concept. Would making this change lead to different trends in certain industries over that period?

Background

In 2018, there were about 10 million business establishments in the United States. Each of these establishments produces a good or provides a service. The product or service that a company produces or provides leads to its classification in a specific industry in which similar businesses are also classified. This grouping of businesses by industry allows for a consistent definition to be used across statistical agencies for the collection and publication of economic statistics. It also allows economists, academics, and businesses to compare features of similar and dissimilar businesses, and it allows federal, state, and local governments to develop policies targeted at businesses within specific industries.

Prior to 1997, businesses were classified into industries on the basis of the 1987 SIC system. A notable feature of the SIC system was the inclusion of special rules for coding “auxiliary” establishments, which the SIC manual defined as follows:

> Auxiliary establishments are distinguished from operating establishments that primarily produce goods and from those that primarily provide services for personal or household use or for other enterprises. Some examples of activities commonly performed by auxiliaries are management and other general administrative functions, such as accounting, data processing, and legal services; research, development, and testing; and warehousing.[3]

The 1987 SIC manual further clarified how auxiliary establishments were assigned industry codes: “Auxiliary establishments are assigned four-digit industry codes on the basis of the primary activity of the operating establishments they serve.”[4] Since 1997, businesses have been classified into industry groups using NAICS. The NAICS 2017 manual includes the following explanation in its preface:

> The North American Industry Classification System is unique among industry classifications in that it is constructed within a single conceptual framework. Economic units that have similar production processes are classified in the same industry, and the lines drawn between industries demarcate, to the extent practicable, differences in production processes. This supply-based, or production-oriented, economic concept was adopted for NAICS because an industry classification system is a framework for collecting and publishing information on both inputs and outputs, for statistical uses that require that inputs and outputs be used together and be classified consistently.[5]

The NAICS 2017 manual also describes auxiliary establishments, as follows:

> Although all establishments have output, they may or may not have receipts. In large enterprises, it is not unusual for establishments to exist to solely serve other establishments of the same enterprise (auxiliary, or enterprise support, establishments). In such cases, these units often do not collect receipts from the establishments they serve. This type of support (captive) activity is found throughout the economy and involves goods-producing activities as well as services. Units that carry out support activities for the enterprise to which they belong are classified, to the extent feasible, according to the NAICS code related to their own activity. This means that warehouses providing storage facilities for their own enterprise are classified as warehouses.[6]

Businesses evolve; they grow, change, and decline. A company may start with only one or two workers, and over time it may grow to have thousands of employees, with worksites located in multiple states and industries. Some of the worksites in other industries may partially or fully support the main company activity. A company may change vendors for the inputs it needs to develop and sell its product or service, and over time it may decide to outsource

part of its product development or service delivery to other companies—sometimes even in other countries. This decision process also applies to worksites that would have been classified as auxiliary establishments under the SIC system.

With a few assumptions about the auxiliary relationship, we can explore how important this concept might be in measuring employment change, particularly by industry. This article focuses on exploring employment trends by various industry groups in order to identify how these trends would have differed if an auxiliary-unit concept was used in the estimation process. (See the box that follows for basic definitions of some of the relevant terms used in this article.)

Definitions

Industry. BLS and other federal statistical agencies classify industries according to the North American Industry Classification System (NAICS). NAICS is hierarchical, with broad industry groups comprising more and more detailed groups.

Worksite. BLS defines a worksite as a single physical location of work. A worksite is also frequently referred to as an establishment. If there is more than one economic activity at the site, the economic activity that generates the most revenue is typically used to determine its primary industry for classification under NAICS.

Unemployment insurance (UI) account. Virtually all employers in the United States are required to register with the appropriate agency in the state in which they are located in order to receive a UI account number. State agencies assign this number to employers to track their mandatory participation in state and federal UI programs. Employers can have multiple worksites within one UI account but are limited to only those within the same state. The employer can choose to have more than one UI account, but a single worksite can only have one UI account.

Employer identification number (EIN). The EIN is a unique nine-digit number issued by the Internal Revenue Service (IRS) to identify a business entity. An EIN can identify a single worksite, or it can identify a group of worksites within one state or across states. (See exhibit 1 for a basic relationship structure.) In this article, the EIN is also referred to as a firm identifier. A firm is an establishment or a combination of establishments that sells goods or services for a profit. Firms can operate in one industry or in multiple industries.*

Quarterly Census of Employment and Wages (QCEW). Data from the BLS QCEW are the product of a federal–state cooperative program. The data are derived from summaries of the employment and total pay of workers covered by state and federal UI legislation and are provided to BLS by state workforce agencies. In addition, employers who operate multiple establishments within a state complete a questionnaire called the “Multiple Worksite Report,” which provides detailed information on employment, wages, and industry for each of their establishments.

QCEW data cover about 97 percent of business employment in the United States, and data are published by county, metropolitan area, state, and the nation for detailed industry groups. The QCEW also collects the UI account number and the federal EIN for each of these employers. Major exclusions from UI coverage include self-employed workers, most agricultural workers on small farms, all members of the Armed Forces, elected officials in most states, most student workers at schools, employees of certain small nonprofit organizations, and railroad workers covered by the railroad unemployment insurance system.

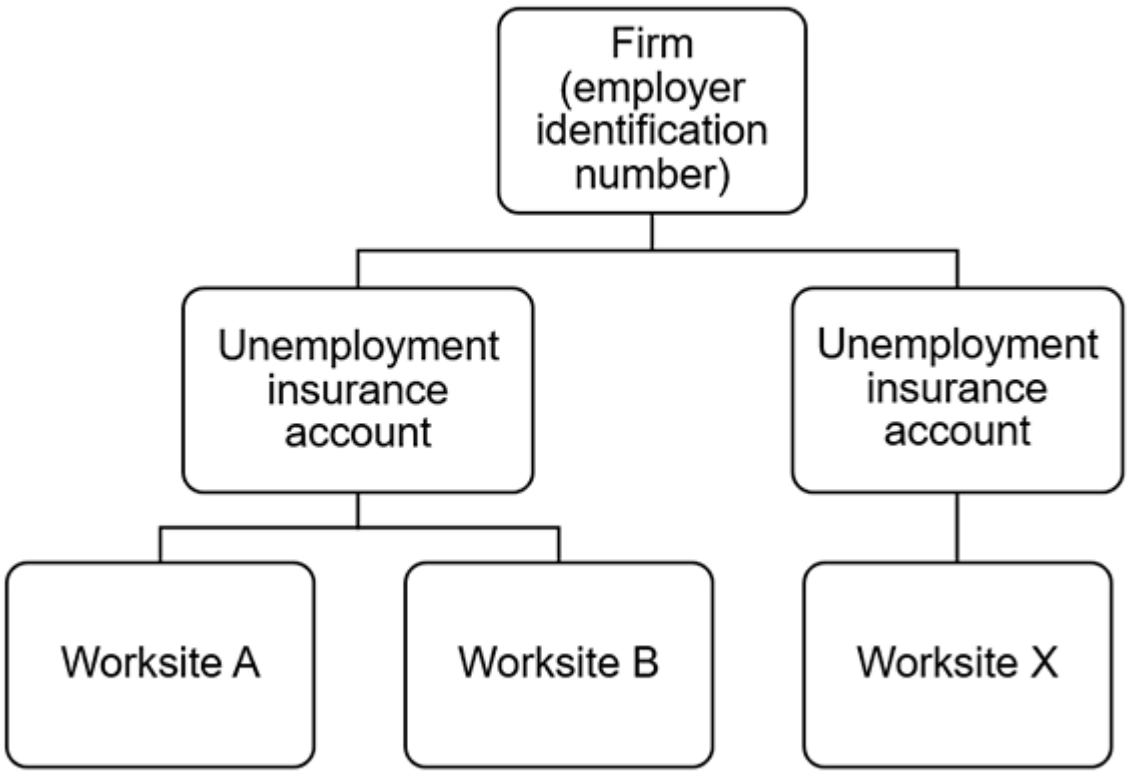
* For more on the "firm" concept, see Akbar Sadeghi, David M. Talan, and Richard L. Clayton, "Establishment, firm, or enterprise: does the unit of analysis matter?" Monthly Labor Review, November 2016, https://www.bls.gov/opub/mlr/2016/article/establishment-firm-or-enterprise.htm.

A methodology to account for auxiliary units

BLS no longer collects data in such a way as to identify auxiliary units. However, we can classify all worksites within an unemployment insurance (UI) account or a federal employer identification number (EIN) on the basis of the dominant industry of the account. Note that this approach serves as a proxy for the auxiliary-unit concept, but it will not capture exactly what a direct coding would.

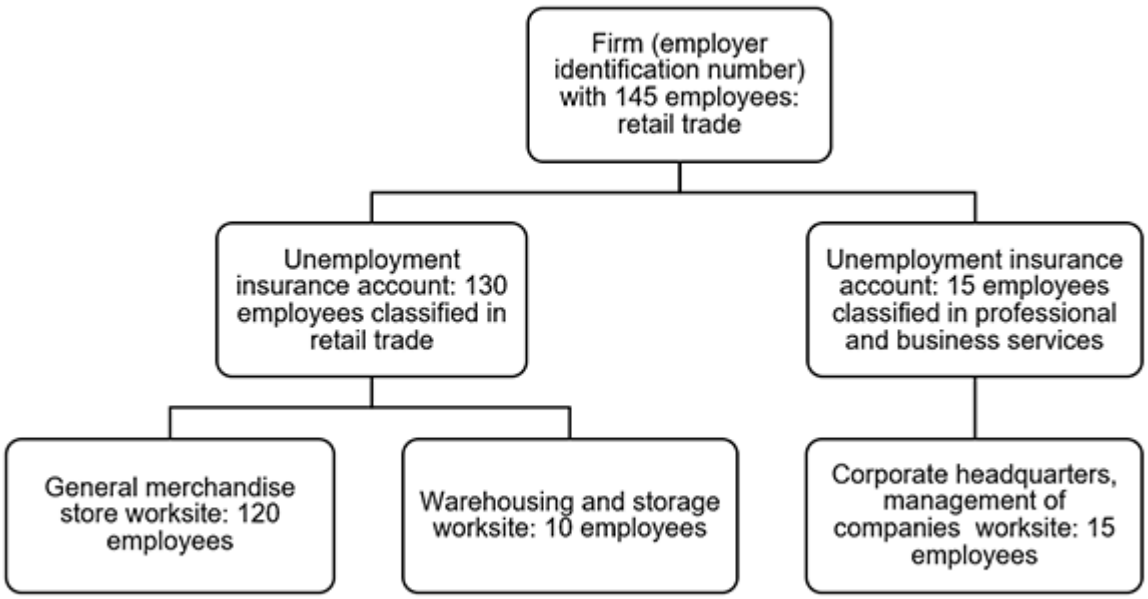
The QCEW program collects data each quarter for all business worksites in the United States, including the number of employees and the total quarterly wages paid.[7] The QCEW also collects information on the worksite location, its UI account number, its federal EIN, and the industry in which it is classified (according to NAICS). With some straightforward assumptions, I assigned the dominant economic activity at the UI account level and at the firm level (i.e., for each group of establishments with the same EIN). The assumptions are that all activity at each worksite is associated with its assigned NAICS code and that the aggregate revenue of the UI account or firm is proportional to the employment at each worksite. With these assumptions, I identified the industry sector that has the most employment within a UI account or within a firm for the third month of each quarter and assigned that industry sector to the entire UI account or firm (for that quarter). (See exhibit 1 for a basic relationship diagram and exhibit 2 for an example.)

Exhibit 1. The basic relationship between a firm and its worksites



Source: U.S. Bureau of Labor Statistics.

Exhibit 2. Example of auxiliary units in a retail trade firm classified according to the primary worksite activity



Source: U.S. Bureau of Labor Statistics.

The analysis presented in this article shows data for employment change classified by industry at the worksite level, by UI account, and by EIN. Clearly, assigning industry classification at a more aggregate company level will produce an employment level that differs from the employment level produced by industry classification at the worksite level. My main interest here is to see if the long-run industry employment story is changed by the reclassification. Therefore, I indexed these data to 1990. (Appendix table A-1 provides the employment levels for the first quarter of 1990, and table A-2 shows index data for all of the industry groups analyzed in this article for the worksite, UI account, and EIN assignment of industry for the 1990–2018 period.) This analysis should help data users identify industries in which the more aggregate trends have deviated substantially from those given by the official worksite-classified statistics.

Note that this analysis allows us to see if aggregate economic trends would have been different if employment in company- and firm-owned worksites in other industries had been included in the primary industry. Total employment, as measured by the QCEW, is not changed by this reassignment, which simply moves selected establishments and their employment from their officially assigned industry group into another one. Therefore, this analysis provides a specific view of employment changes at a broad industry level and examines whether the inclusion of an auxiliary-unit proxy concept changes the economic story in each industry group. Different trends over time could result from several factors outside the scope of this analysis. Principally, this analysis does not determine whether changes in trends are due to aggregate changes in ownership of auxiliary-like worksites or changes in employment in the auxiliary-like industries. What this analysis explores is how much employment is directly attributable to firms whose aggregate primary activity is within a specific industry group, plus the employment associated with worksites owned by those firms that are classified outside of that industry group.

Potential errors associated with reclassification

There are a number of potential errors associated with this reclassification methodology. Among them are the following:

- NAICS codes are rarely in error at the two-digit level. However, when errors are identified during QCEW processing, they are corrected for the current and future quarters, but no historical corrections are made. This analysis accepts the QCEW NAICS six-digit codes as reported each quarter.
- Worksites with multiple economic activities are instructed to select the primary activity in order to assign a NAICS code. The activity associated with the highest revenue stream is usually selected as the primary activity. This analysis assumes that the aggregate revenue of the UI account or firm is associated with its worksites proportional to the employment at each worksite. This assumption is reasonable, and it generally will provide reasonable results; however, there are certainly isolated cases in which it will not. For example, when examining a firm that has an e-commerce worksite and a fulfillment center (i.e., a warehouse) worksite, the highest revenue is likely to be associated with the e-commerce site, whereas the highest employment may be associated with the warehouse site. This analysis does not attempt to make any corrections for such situations.
- This reclassification is based on ownership of worksites and does not include a detailed examination to determine relevance. Therefore, this reclassification may assign relevant worksites outside of the core industry (e.g., it could move a small retail worksite out of retail trade and into wholesale trade), and it could assign to the industry worksites that are completely unrelated to the primary industry.
- Although an EIN usually identifies all of the worksites within a business organization, a single business can obtain multiple EINs. For the purposes of this article, each EIN is treated as an independent firm.

These errors are expected to be small enough not to change the broad results contained in this analysis.

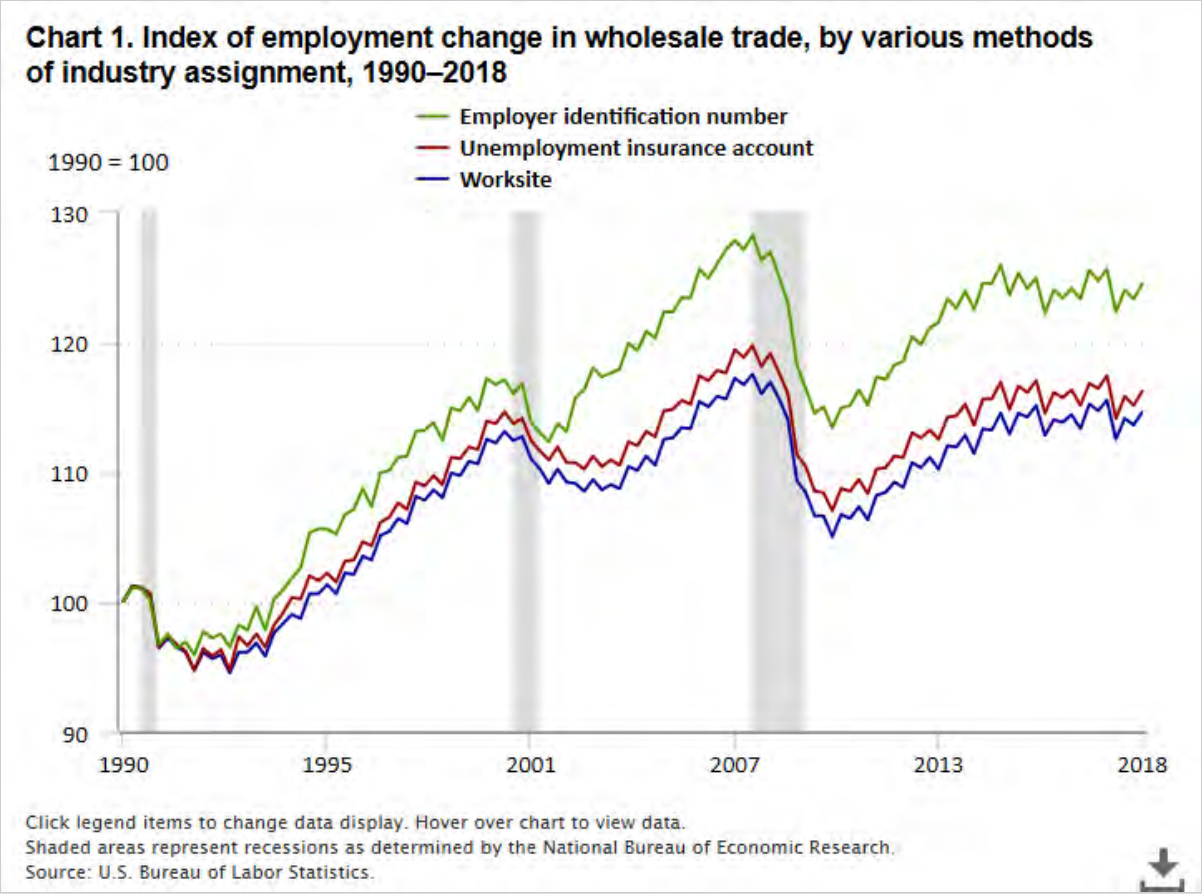
BLS organizes NAICS sectors into broader groupings for some publications. These groupings are natural resources and mining; construction; manufacturing; trade, transportation, and utilities; information; financial activities; professional and business services; education and health services; leisure and hospitality; other services, except public administration; public administration; and an “unclassified” category. The analysis in this article uses these broader industry groupings, with two exceptions—natural resources and mining; and trade, transportation, and utilities are analyzed at the more detailed NAICS-sector level. The analysis omits the unclassified category. Therefore, this article examines the following industry groups: agriculture, forestry, fishing, and hunting; mining, quarrying, and oil and gas extraction; construction; manufacturing; wholesale trade; retail trade; transportation and warehousing; utilities; information; financial activities; professional and business services; education and health services; leisure and hospitality; other services, except public administration; and public administration.

Results

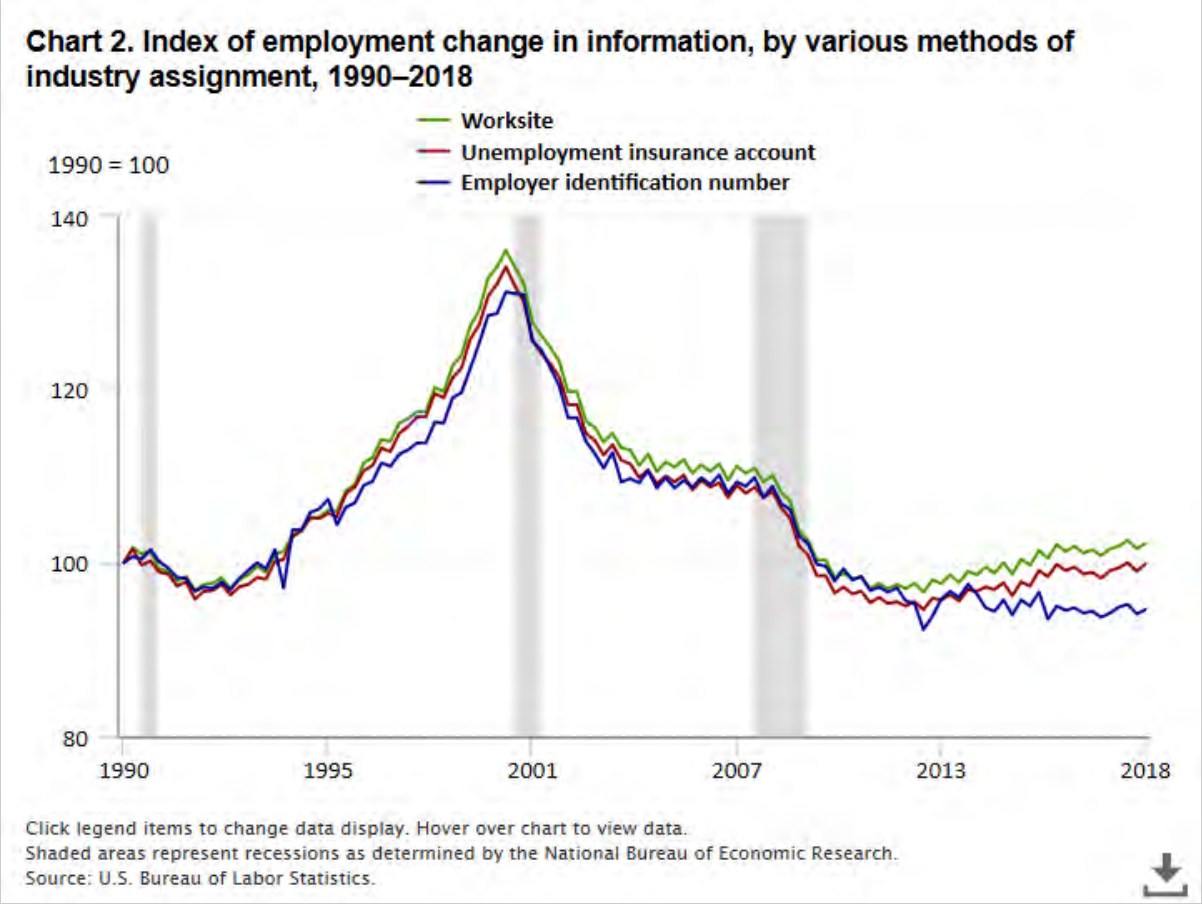
The analysis in this article includes a reassignment of industry at both the UI account level and the EIN (firm) level. As expected, the assignment of industry at the UI account level results in employment trends that are closer to the trends seen at the worksite-assigned level, because the aggregation of worksites is on a smaller scale. For this reason, this analysis focuses on comparing data with an assignment of industry at the EIN or firm level by using data that have been categorized with the official worksite industry assignment. The analysis focuses mostly on the

end points of the various indexes that were created for this purpose, in order to identify industry sectors in which the economic story would be most similar and most different under this proxy auxiliary assignment procedure.

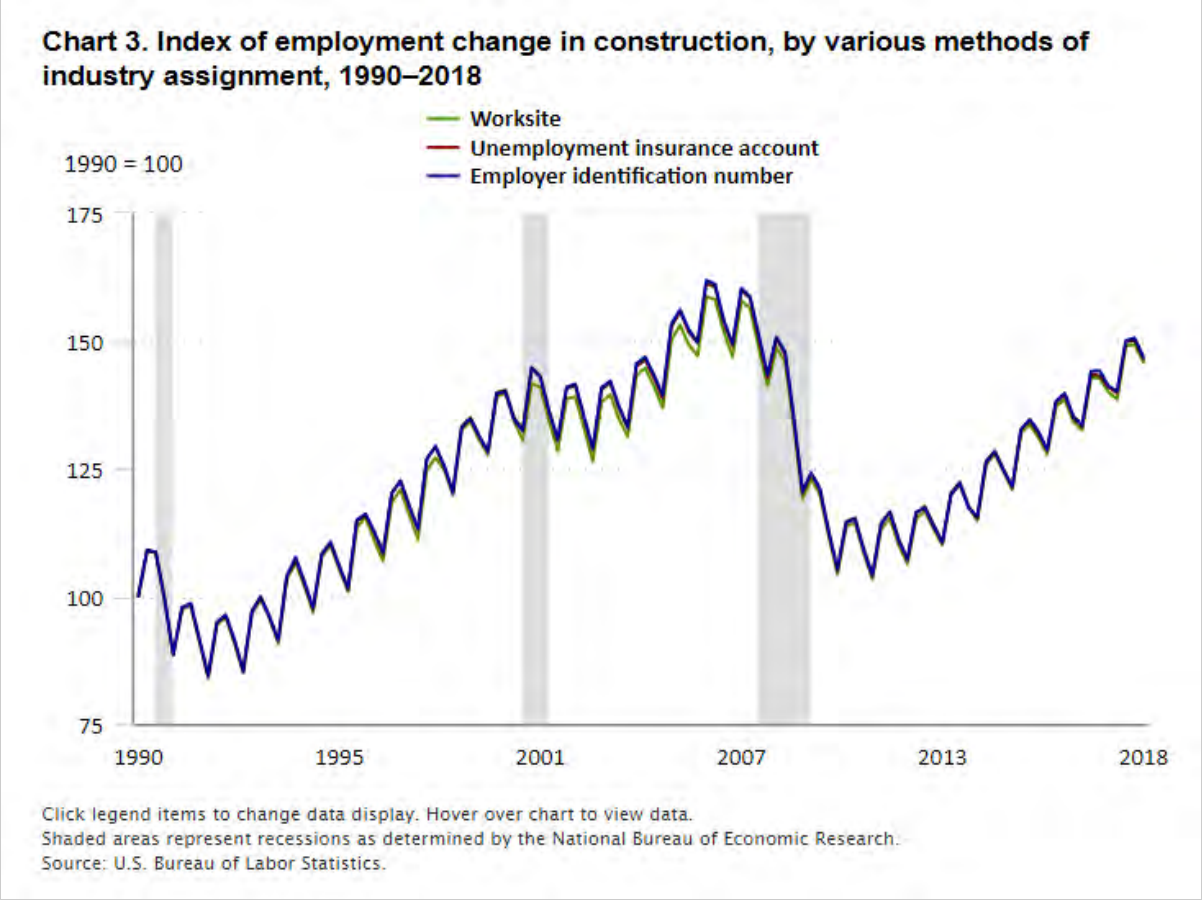
The industry with the largest positive percent difference between the EIN index and the worksite index over the 1990–2018 period is wholesale trade. Chart 1 shows a continually stronger trend in the EIN index, except around recessions. The data show that the EIN index grew 8.6 percent more than the worksite index over the period. This finding indicates that firms in the wholesale trade industry expanded their ownership of (and employment in) worksites outside of the wholesale trade industry during the study period.



The industry with the largest negative percent difference between the EIN index and the worksite index over the 1990–2018 period is information. (See chart 2.) There was some limited deviation early in the period, but it moderated in early 2000. The deviation returned in early 2014 and mostly widened each quarter until the end of the period. The result is an EIN index that was 7.5 percent lower than the worksite index in 2018. This finding indicates that firms in the information industry reduced their ownership of (and employment in) worksites outside of the information industry over the 1990–2018 period.



By contrast, as shown in table 1, the industries with the least deviation between the EIN index and the worksite index over the period are other services (+0.4 percent), utilities (−0.6 percent), and construction (+0.7 percent). Among these three industries, construction had the most employment. The index of employment change for construction is shown in chart 3. Visually, we see very little deviation between the EIN index and the worksite index for the construction industry over the entire 1990–2018 period.



Charts 1, 2, and 3 show, respectively, positive, negative, and “no change” deviations between worksite and EIN industry coding. Table 1 provides information on the relative percent difference in the index values (at the end of the period) between the EIN NAICS reassignment and the original worksite NAICS code assignment, the difference in employment change, and the relative percent employment change (taking the difference in employment change divided by the final employment level of the worksite NAICS assignment).[8]

Table 1. Measures of employment change, by industry, between EIN-assigned industry and worksite-assigned industry

Industry	Relative percent difference in **index values: (EIN – WS) / WS**	Difference in employment **change (EINΔ – WSΔ)**	Relative percent employment **change, (EINΔ – WSΔ) / WS**
Agriculture, forestry, fishing and hunting	2.2	16,885	1.5
Mining, quarrying, and oil and gas extraction	–5.1	–34,787	–5.1
Construction	0.7	37,409	0.5
Manufacturing	–1.8	–684,757	–5.4
Wholesale trade	8.6	316,505	5.4
Retail trade	3.0	521,647	3.2
Transportation and warehousing	–3.0	–278,485	–5.0

See footnotes at end of table.

Table 1. Measures of employment change, by industry, between EIN-assigned industry and worksite-assigned industry

Industry	Relative percent difference in **index values: (EIN – WS) / WS**	Difference in employment **change (EINΔ – WSΔ)**	Relative percent employment **change, (EINΔ – WSΔ) / WS**
Utilities	–0.6	–11,768	–2.1
Information	–7.5	–219,373	–7.8
Financial activities	1.1	99,178	1.2
Professional and business services	5.3	–6,448	0.0
Education and health services	2.4	379,854	1.7
Leisure and hospitality	1.1	189,686	1.2
Other services, except public administration	0.4	–25,979	–0.6
Public administration	–1.6	–271,911	–1.2

Note: EIN = employer identification number; WS = worksite.

Source: U.S. Bureau of Labor Statistics.

Table 1 shows that the industries with the largest positive difference in employment change between the worksite- and EIN-based industry assignments over the 1990–2018 period are retail trade (+521,647), education and health services (+379,854), and wholesale trade (+316,505). The industries with the largest negative difference in employment change in this reassignment are manufacturing (−684,757), transportation and warehousing (−278,485), public administration (−271,911), and information (−219,373). The industries in which employment change was the least affected by this reassignment are professional and business services (−6,448), utilities (−11,768), and agriculture, forestry, fishing and hunting (+16,885)

The analysis presented in this article identifies industries whose firms changed their pattern of other-industry worksite ownership and employment over the 1990–2018 period. For example, as classified by the official worksite industry assignment, employment in retail trade grew by about 3.3 million over the period. However, when the data are reclassified at the firm level, employment growth in retail trade during this period increases to about 3.8 million. Therefore, a firm-level industry classification strategy shows somewhat stronger growth for retail trade plus retail-owned firms than the growth shown by the original worksite industry assignment. Based on this strategy of identifying deviations in employment change between worksite and EIN industry assignment, the following industries changed the most over the period from the first quarter of 1990 to the fourth quarter of 2018: manufacturing, wholesale trade, information, retail trade, and transportation and warehousing. (See appendix table A-2 for index data for all of the industry groups examined in this article at the worksite, UI account, and firm level.)

A deeper look at the two industries that changed the most over the 1990–2018 period after reclassification

This section takes a deeper look at some of the most substantial compositional changes identified in the earlier analysis of broad industry employment trends. Recall that, under NAICS, industry assignment is determined by the worksite's dominant economic activity. Hence, the majority of employment in a firm with multiple worksites

generally will be in the industry originally assigned to the firm in the QCEW.[9] In this article, this employment is referred to as core industry employment. The firm may also own establishments and have employment in other industries, and this is referred to as noncore employment. In this section, I briefly explore the distribution of noncore employment in wholesale trade and retail trade, the two industries that showed the most difference between worksite and EIN industry assignment in the earlier analysis.

Wholesale trade

In the fourth quarter of 2018, core wholesale trade employment (i.e., employment in worksites and firms that shared the same industry classification) represented 87.2 percent of total employment in the industry. The noncore employment in firms connected to wholesale trade was most concentrated in management of companies and enterprises (1.8 percent), professional and technical services (1.5 percent), and warehousing and storage (1.0 percent), computer and electronic products manufacturing (0.8 percent), chemical manufacturing (0.7 percent), and building material and garden supply stores (0.6 percent). An additional 6.4 percent of noncore employment was spread among many other three-digit industries. (See table 2.)

Table 2. Noncore employment as a percentage of total firm employment in wholesale trade, by three-digit NAICS subsector, fourth quarter 2018

Industry	Percent
Total	12.8
Management of companies and enterprises	1.8
Professional and technical services	1.5
Warehousing and storage	1.0
Computer and electronic products manufacturing	0.8
Chemical manufacturing	0.7
Building material and garden supply stores	0.6
Remaining	6.4

Note: The “remaining” category consists of smaller shares of employment spread among many other three-digit industries. NAICS = North American Industry Classification System.

Source: U.S. Bureau of Labor Statistics.

In wholesale trade, the noncore industries in which employment increased the most over the 1990–2018 period when they were reclassified at the EIN level included auxiliary worksites in professional and business services (+2.5 percent),[10] manufacturing (+0.9 percent),[11] and transportation and warehousing

(+0.9 percent).[12] In total, firms in the wholesale trade industry reduced the employment share of the core industry by 4.7 percent. At the three-digit level, these firms mainly added additional worksites and employment in management of companies and enterprises (+1.1 percent), professional and technical services (+1.0 percent), and warehousing and storage (+0.8 percent). (See table 3.)

Table 3. Largest noncore industry employment changes in wholesale trade when industries are **reclassified at the EIN level, 1990–2018**

Noncore industry	Percent change in employment share

See footnotes at end of table.

Table 3. Largest noncore industry employment changes in wholesale trade when industries are **reclassified at the EIN level, 1990–2018**

Noncore industry	Percent change in employment share
Management of companies and enterprises	1.1
Professional and technical services	1.0
Warehousing and storage	0.8

Note: Changes measured from fourth quarter 1990 to fourth quarter 2018. EIN = employer identification number.

Source: U.S. Bureau of Labor Statistics.

Retail trade

In the fourth quarter of 2018, core employment in retail trade represented 93.3 percent of total employment for the industry. The noncore employment in firms connected to retail trade was primarily found in warehousing and storage (2.3 percent) and management of companies and enterprises (1.9 percent). (See table 4.)

Table 4. Noncore employment as a percentage of total firm employment in retail trade, by three-digit NAICS subsector, fourth quarter 2018

Industry	Percent
Total	6.7
Warehousing and storage	2.3
Management of companies and enterprises	1.9
Merchant wholesalers, nondurable goods	0.3
Merchant wholesalers, durable goods	0.3
Telecommunications	0.3
Administrative and support services	0.3
Remaining	1.3

Note: The “remaining” category consists of smaller shares of employment spread among many other three-digit industries. NAICS = North American Industry Classification System.

Source: U.S. Bureau of Labor Statistics.

In retail trade, the noncore industries in which employment increased the most over the 1990–2018 period when they were reclassified at the EIN level included auxiliary worksites in transportation and warehousing (+1.7 percent), professional and business services (+1.1 percent), and information (+0.3 percent). The noncore industry with the largest decrease in employment over this period was worksites in manufacturing (−0.4 percent). In total, firms in the retail trade industry reduced the employment share of the core industry by 2.4 percent over these years. At the three-digit level, these firms mainly added more worksites and employment in warehousing and storage (+1.6 percent), management of companies and enterprises (+1.1 percent), and telecommunications (+0.3 percent). Although these changes do not fully encompass the e-commerce-related changes in and outside of this industry, they seem to support the e-commerce changes in retail trade that are well known—that is, a greater reliance on warehousing and storage, management of companies and enterprises, and telecommunications. (See table 5.)

Table 5. Largest noncore industry employment changes in retail trade when industries are reclassified at **the EIN level, 1990–2018**

Noncore industry	Percent change in employment share
Warehousing and storage	1.6
Management of companies and enterprises	1.1
Telecommunications	0.3

Note: Changes measured from fourth quarter 1990 to fourth quarter 2018. EIN = employer identification number.

Source: U.S. Bureau of Labor Statistics.

Conclusion

Several economic statistics can be used to measure industry change. BLS statistics used for this purpose include employment, hours, wages, turnover, industry productivity, and producer prices. This suite of statistics tells us much about the growth and decline of industries and about changes in prices, industry hires and separations, industry productivity, and average hourly, weekly, and annual wages paid to employees. These statistics can be supplemented by looking at employer size class, business age, the employment associated with expanding and contracting businesses, and other statistics readily available from BLS. Each of these statistics is mostly focused on telling us how industries are doing today, with some historical context to aid in understanding their contribution to the overall economy.

The statistics I have examined in this article are not focused on how much employment is in an industry or how much its employees are paid. Rather, the article examines data to identify industries in which employment trends would have been different if an auxiliary-like industry coding practice had been used, and then briefly explores the composition of industries in which those trends were most changed when the auxiliary-unit concept was used.

This article shows that, over the study period, several industries changed compositionally with respect to the noncore worksites that businesses own. Among the industries that changed the most over the period are wholesale trade and retail trade. The article also confirms that the worksite assignment of industry typically yields similar employment trend results to industry assignment made at the level of a UI account or an EIN, with some moderate deviations.

Appendix: recode data and index data

Table A-1. Recode data: levels for first quarter 1990 for data coded to NAICS by worksite, UI account, and EIN (in thousands)

Table A-2. Index data for all industries, worksite, UI account, and EIN assignment of industry, 1990–2018

SUGGESTED CITATION

Kenneth W. Robertson, "Measuring industry employment, 1990–2018: a look at the auxiliary-unit concept," Monthly Labor Review, U.S. Bureau of Labor Statistics, April 2021, https://doi.org/10.21916/mlr.2021.7.

NOTES

1 For more information on the North American Industry Classification System (NAICS), see https://www.census.gov/naics/. The use of NAICS as an industry classification system is mandated for federal statistical agencies by the Office of Management and Budget. Having a common classification system allows data users to compare data from various federal statistical agencies, knowing that each agency defines industries in the same way. NAICS also facilitates efficient sampling and estimation, because within detailed industry and size-class cells, the business activities, employment, and wages across worksites are relatively homogenous.

2 The former concept of the auxiliary unit from the Standard Industrial Classification (SIC) system was not ideal. The concept was based on ownership as well as function, which tended to reduce the clarity of economic reports. For example, consider a large retail firm that operates its own warehouse, and suppose that the warehouse was classified as part of a retail-owned business (as it would be under the SIC system). Now suppose that the retailer decides to make the warehouse part of a separate company, with the retailer purchasing warehousing services from it. In this scenario, employment would have declined in retail trade and increased in warehousing and storage. But the employment decline really had nothing to do with retail trade; rather, it was about a company's decision about which support services to own and which to purchase. By contrast, under NAICS, the warehouse would be assigned to the warehousing and storage industry, regardless of ownership. As a result, NAICS makes economic trends for warehousing and storage about that industry and its functions, rather than about who owns the warehouse. Nevertheless, note that this increased clarity of reporting about what is happening in individual industries can also obscure broader changes in businesses, especially in the longer term. Over the past few decades, for example, growth in e-commerce (retailers that do not operate in a traditional brick-and-mortar site) has led to that industry taking over a substantial portion of retail sales. This transformation of the retail sector affects employment in a number of industries that support e-commerce, including warehouses, and couriers and messengers.

6 Ibid., pp. 19–20.

7 For more information, see the U.S. Bureau of Labor Statistics Quarterly Census of Employment and Wages page at https://www.bls.gov/cew/.

8 Note that some worksites enter the unemployment insurance system without having a NAICS industry code and are labeled "unclassified" until an industry code is assigned. Table 1 excludes a row for these records; therefore, the sum of the differences shown do not sum to zero.

9 In this article, the NAICS code is assigned as the two-digit industry with the single largest employment value among all two-digit industry employment values from worksites owned by the firm.

10 The professional and business services industry group includes the NAICS two-digit industries 54, 55, and 56.

11 The manufacturing industry includes the NAICS two-digit industries 31, 32, and 33.

12 The transportation and warehousing industry includes the NAICS two-digit industries 48 and 49.

The U.S. productivity slowdown: an economy-wide and industry-level analysis

Labor productivity—defined as output per labor hour—has grown at a below-average rate since 2005, representing a dramatic reversal of the above-average growth of the late 1990s and early 2000s. The productivity slowdown during these years has left many economic observers wondering why this situation has occurred and what factors may have contributed. To clarify potential sources of the productivity slowdown, this article presents an analysis of labor *productivity and its component series—multifactor* productivity, contribution of capital intensity, and *contribution of labor composition—at both the economy-*wide and industry levels, complemented with a survey of the contemporary productivity literature.

Shawn Sprague
sprague.shawn@bls.gov

Shawn Sprague is an economist in the Office of Productivity and Technology, U.S. Bureau of Labor Statistics.

The figure—$10.9 trillion—represents the cumulative loss in output in the U.S. nonfarm business sector due to the labor productivity slowdown since 2005, also corresponding to a loss of $95,000 in output per worker.[1]

These figures show that, when there is consistently below-average productivity growth, year after year, a substantial effect can result over an extended period. How could this situation have occurred, in a modern and technically advanced economy such as in the United States? Well, not only has the productivity slowdown been one of the most consequential economic phenomena of the last two decades, but it also represents the most profound economic mystery during this time, and though many economists have grappled with the issue for over a decade and even created some innovative research approaches to address the question, we still cannot fully explain what brought on this situation.

One of the more perplexing aspects of the current slowdown is its genesis: that it came immediately following a historic productivity boom in the United States, and represented a swift rebuke of the popular idea of that time that we had entered a new era of heightened technological progress. The suddenness and size of the reversal were difficult to comprehend. For some background, in the late 1990s, when that much-cited productivity boom had begun, U.S. labor productivity growth had accelerated to rates of change that had not been seen since the late 1960s and early 1970s. This late 1990s surge surprised many economic observers, who had become accustomed to the below-average productivity growth rates of the mid-to-late 1970s through the early 1990s. In addition, the

situation in the United States was even more startling due to the fact that the rest of the more-developed economies of the world were not similarly experiencing a speedup in growth rates.[2]

A debate ensued among economists: Was the tremendous productivity growth of the late 1990s here to stay—a fundamental change generated by the computing and internet-related innovations that were all around us—or was it a temporary phenomenon that would pass? The fact that the productivity speedup persisted through the recession of 2001, and then became even more pronounced in 2002, convinced many observers that perhaps something had changed.[3] The acceleration of U.S. productivity growth is shown in figure 1, illustrated by the growth rates during 1998 through 2005, which rise above the long-term average rate since 1947, denoted by the dashed blue line. Over these high-growth years, U.S. labor productivity grew at an average rate of 3.3 percent,[4] which is markedly higher than the cumulative 2.1-percent average rate from 1947 to 2018.

Figure 1. Labor productivity growth: annual percent changes, nonfarm business sector, 1994–2018

This high-growth period came to an end during the mid-2000s, when U.S. labor productivity growth rates began to stumble, and in 2006 receded below the long-term average trend line for the first time in a decade. And, notwithstanding 2 years of high growth in 2009 and 2010 following the Great Recession, productivity growth rates have remained stubbornly low in subsequent years. Many economic observers were yet again surprised, in this case at just how drastically growth rates slowed, given the recently observed high rates of growth and the continued technological innovations that were proliferating throughout the economy. In the years since 2005, labor productivity has grown at an average annual rate of just 1.3 percent, which is lower than the 2.1-percent long-term

average rate from 1947 to 2018. The slow growth observed since 2010 has been even more striking: labor productivity grew just 0.8 percent from 2010 to 2018.

As the slowdown in labor productivity growth has steadily held on throughout the past decade, economic observers have been trying to understand this phenomenon, which has the effect of placing downward pressure on economic growth, worker compensation gains, profits growth, and gains in living standards of Americans. Many observers began to wonder: Why has U.S. labor productivity growth been so consistently low in recent years, and why is it so markedly different from the strong growth observed relatively recently? This article presents two approaches to address these questions, with each approach including an analysis of the U.S. Bureau of Labor Statistics (BLS) productivity data and a review of the contemporary productivity literature. First, the economy-wide slowdown in labor productivity growth is analyzed by breaking out the series into its three component series: multifactor productivity (MFP) growth, the contribution of capital intensity, and the contribution of labor composition. Second, industry-level productivity data are used to identify the industries that made notable contributions to the economy-wide labor productivity slowdown.

Economy-wide analysis of the U.S. labor productivity slowdown

This section presents an analysis of the economy-wide slowdown in labor productivity growth that decomposes the series into its three component series: multifactor productivity growth, the contribution of capital intensity, and the contribution of labor composition. This section also presents a dollar and time cost analysis of the slowdown, and an analysis of how U.S. regions impacted the economy-wide slowdown.

Decomposition of labor productivity growth

Labor productivity is a measure of economic performance that compares the amount of goods and services produced (output) with the number of labor hours used in producing those goods and services. It is defined mathematically as output per hour of work, and growth occurs when output increases faster than labor hours. For example, if output is rising by 3 percent and hours are rising by 2 percent, then labor productivity is growing by 1 percent.

Labor productivity growth is vitally important to present and future prospects for economic growth, because it represents the only path by which economic growth can rise above what would be possible by simply increasing labor hours (as, by definition, economic growth can only come from either hours growth or labor productivity growth). The economic gains brought about by labor productivity growth make it possible for an economy to achieve higher growth in labor income,[5] profits and capital gains of businesses, and public sector revenue; these economic gains also hold the potential to lead to improved living standards for those participating in an economy, in the form of higher income, greater leisure time, or a mixture of both. In addition, as labor productivity rises, all of these factors may increase simultaneously, without gains in one coming at the cost of one of the others.

Given the importance of labor productivity growth, it is worth delving into the measure in more detail to see what underlying factors are making this growth possible. As such, in addition to labor productivity growth being defined as a residual—the difference between output growth and hours growth—we can also analyze it as a sum, built up from the contributions of its three component series.

Components of labor productivity growth

The following equation allows us to quantify the sources of labor productivity growth and helps us better understand the measure by looking into its three component series:

labor productivity growth = multifactor productivity growth + contribution of capital intensity + contribution of labor composition

Multifactor productivity (MFP) growth represents the portion of output growth that is not accounted for by the growth of capital and labor inputs and is due to contributions of other inputs, such as technological advances in production, the introduction of a more streamlined industrial organization, relative shifts of inputs from low to high productivity industries, increased efforts of the workforce, and improvements in managerial efficiency. Similar to labor productivity growth, MFP growth can also be defined as a residual—output growth minus the growth of the combined inputs of labor and capital.

The contribution of capital intensity is defined as the capital-weighted change in the capital-labor ratio. The measure is computed as capital's share of current dollar costs multiplied by the growth in capital services per labor hour. The contribution of capital intensity—also called capital deepening—reflects businesses' decision-making process between hiring more workers and purchasing more or higher-quality equipment, or of substituting equipment for workers or vice versa.* In cases in which firms increase their usage of capital relative to labor, or where capital costs rise relative to labor costs, there will be an increase in the contribution of capital intensity to labor productivity growth.

The contribution of labor composition is defined as the labor-weighted change in a measure—labor composition—which reflects shifts in the level of skills and experience of the workforce. It is computed as labor's share of current dollar costs multiplied by labor composition.** The contribution of labor composition helps us gauge the productive capacity of the workforce at a given point in time. When firms hire more workers with higher skills and more experience or lay off workers with lower skills or less experience, or when labor costs rise relative to capital costs, the contribution of labor composition to labor productivity growth increases.

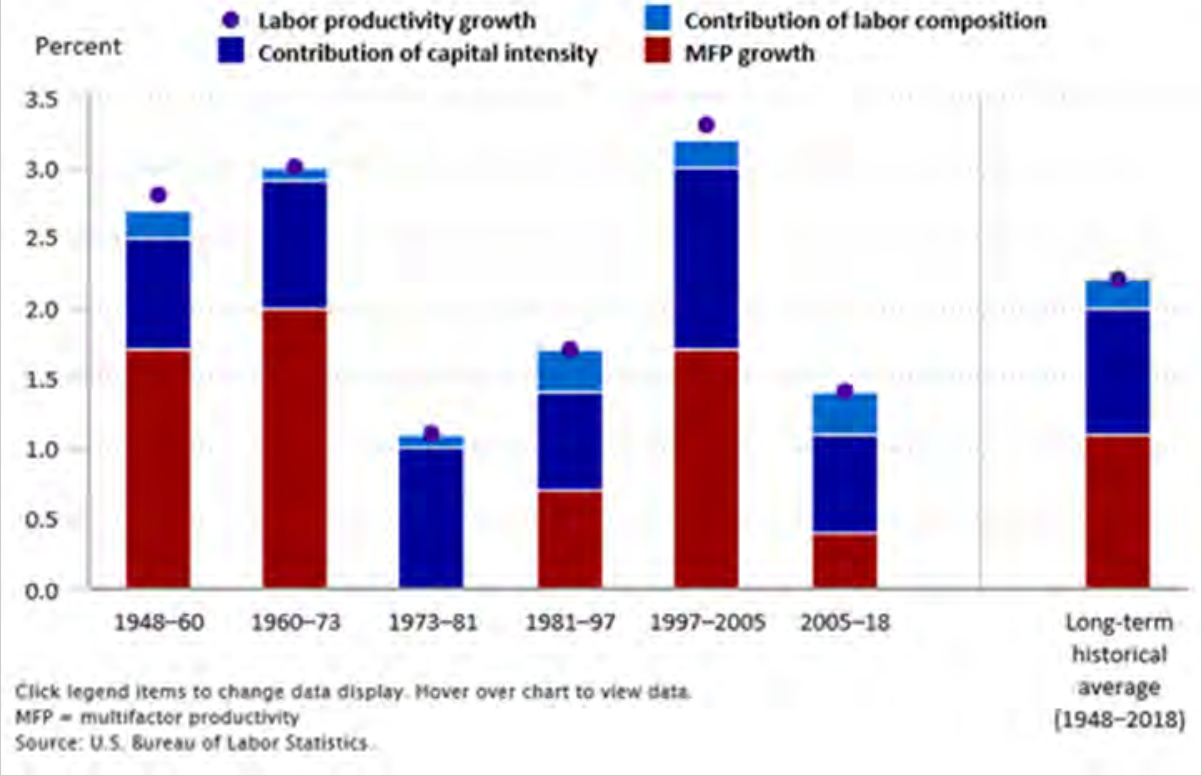
* Specifically, the contribution of capital intensity is defined as $w_k \left[\left(\ln\frac{K_t}{K_{t-1}}\right) - \left(\ln\frac{L_t}{L_{t-1}}\right)\right]$, where w_k is the 2-year average cost share of capital and K_t and L_t are capital services and labor hours at a given time t.

** The BLS labor composition methodology can be found at https://www.bls.gov/mfp/mprlabor.htm.

The three components of labor productivity growth are displayed in figure 2 for the slowdown period (2005–18), the speedup period (1997–2005), as well as other selected post-World War II (WWII) periods and the long-term historical average.[6] Labor productivity growth, corresponding to the purple dots, represents the sum of the three stacked bars of MFP growth,[7] contribution of capital intensity, and contribution of labor composition. It is apparent that the labor productivity growth rate (1.4 percent) of the slowdown period has slackened relative to the rate of the

speedup period and is also below the long-term historical average. Furthermore, we can see from the diminished red and dark-blue stacked bars of the slowdown period relative to the bars of the speedup period that MFP growth and the contribution of capital intensity are the sources of the U.S. labor productivity slowdown. (The contribution of labor composition was approximately the same as that of the speedup period and did not contribute to the slowdown.[8]) MFP grew 0.4 percent during the slowdown period, which is less than one-fourth the growth of the speedup period and is also well below the long-term historical average. In addition, the contribution of capital intensity in the slowdown period, 0.7 percent, is around half that of the speedup period and is also below the long-term historical average.

Figure 2. Contributions to labor productivity growth: MFP growth, contribution of capital intensity, contribution of labor composition, average annual growth rates for selected periods, private nonfarm business sector, 1948–2018



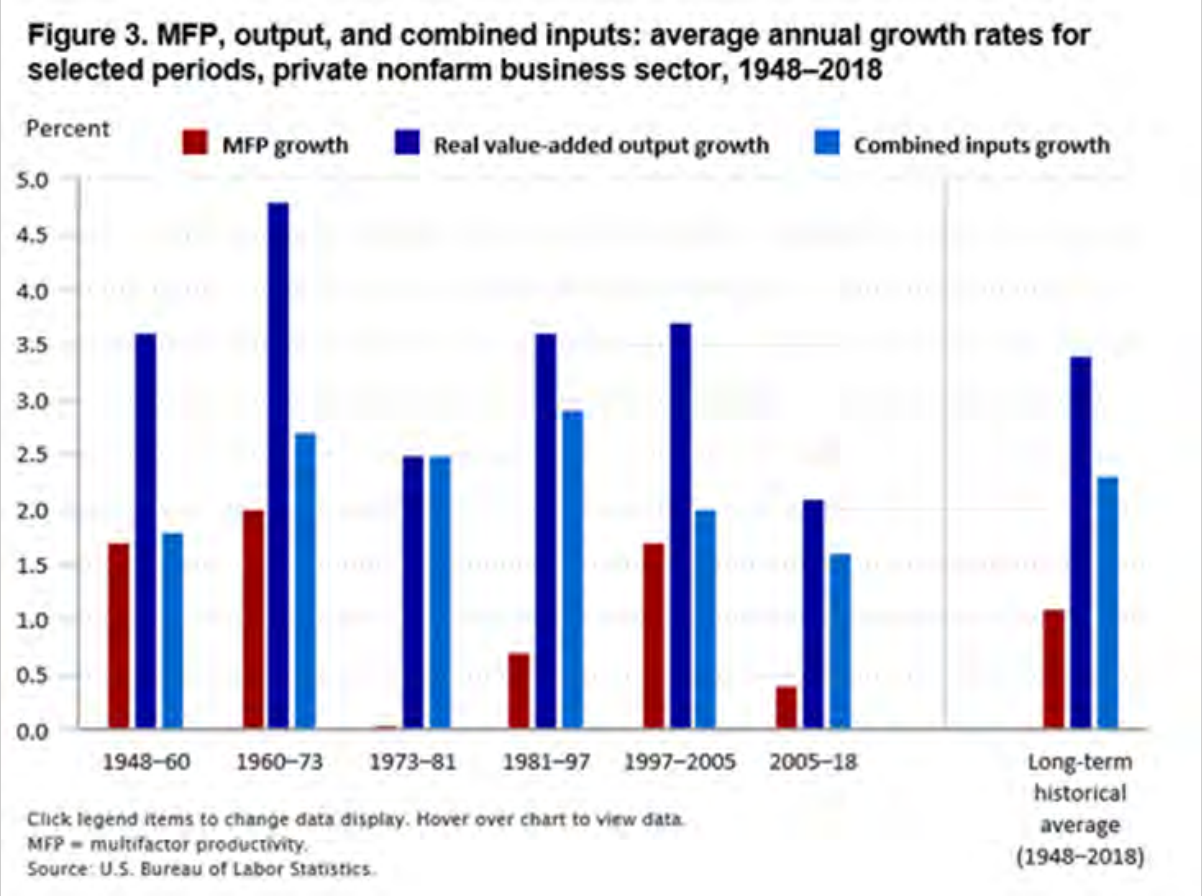
The deceleration in MFP growth—the largest contributor to the slowdown—explains 65 percent of the slowdown relative to the speedup period; it also explains 79 percent of the sluggishness relative to the long-term historical average rate. The massive deceleration in MFP growth is also emblematic of a broader phenomenon shown in figure 2. We can see that throughout the historical period since WWII, the majority of the variation in labor productivity growth from one period to the next was from underlying variation in MFP growth, rather than from the other two components. While the contribution of labor composition varied only between a range of 0.1 percent to 0.3 percent during the entire post-WWII era and the contribution of capital intensity varied between 0.7 percent and 1.3 percent, MFP growth varied within a wider range, between 0.0 percent and 2.0 percent.[9]

At the same time, in addition to the notable variation in MFP growth during the recent periods, something unprecedented about these recent periods was the additional contribution from variation in the contribution of capital intensity. The contribution of capital intensity had previously remained within a relatively small range (0.7 percent to 1.0 percent) during the first five decades of post-WWII periods, but then in the 1997–2005 period, the measure nearly doubled, from 0.7 percent up to 1.3 percent, followed by nearly halving to 0.7 percent in the 2005–18 period. This unprecedented variation in the contribution of capital intensity was the factor that combined with the variation in MFP growth to bring about such historic speedup and slowdown periods in recent years, increasing the size of the overall labor productivity slowdown to rival the widely noted 1970s slowdown. The contribution of capital intensity accounts for 34 percent of the labor productivity slowdown relative to the speedup period and explains 25 percent of the sluggishness relative to the long-term historical average rate.

The slowdown in MFP growth

Now let us take a deeper look into the two contributors to the labor productivity slowdown. For MFP growth, let us start out by noting the inherent difficulty in attempting to quantify the sources, components, or causes of MFP growth or lack thereof. This difficulty arises because MFP growth itself cannot be measured or identified on its own but can only be ascertained as the leftover output growth that remains after all measurable inputs to production—in this case, labor and capital[10]—have already been taken into account. With MFP growth, we are actually measuring something that is unidentifiable, similar to how cosmologists can measure the extent of dark matter and its influence on the universe even as they do not know what this matter comprises.[11] This is the reason that the question of what is driving the slowdown in MFP growth has puzzled so many economic observers in recent years and still remains incompletely explained following more than a decade of work on the issue.

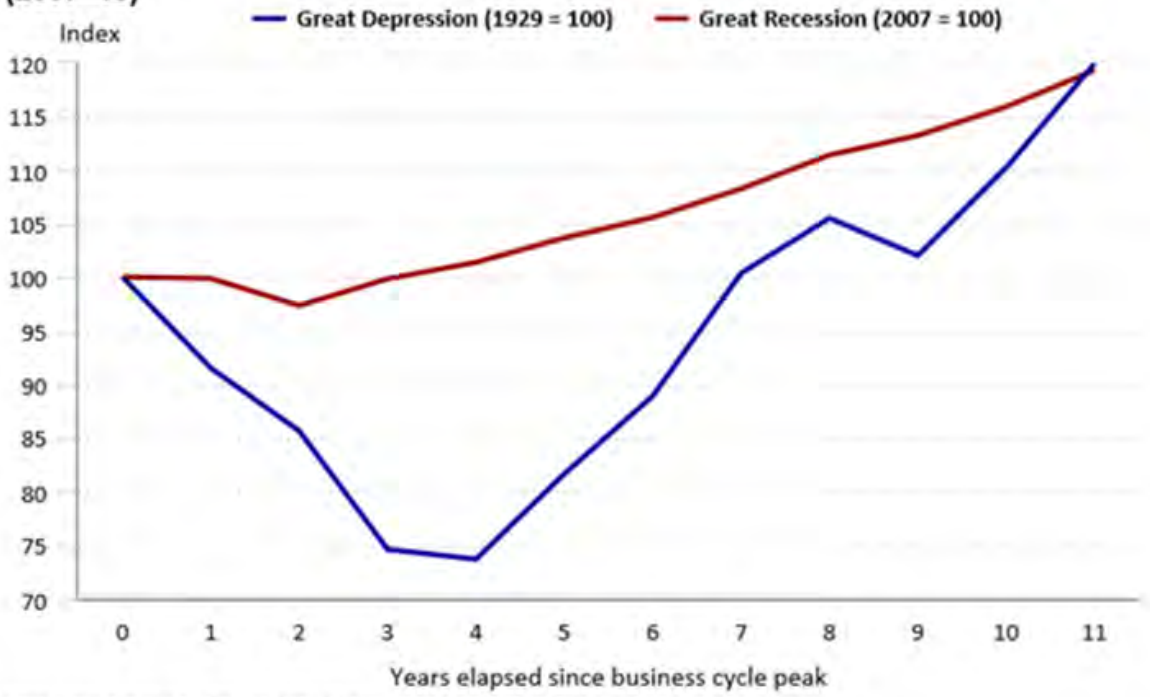
However, there are a few approaches that can be taken to help us gain a foothold on what might be happening to MFP growth, both by using BLS data as well as by looking at some clever approaches of the numerous researchers working on this issue. As a first step in our analysis, let us look at the BLS series used in calculating MFP growth, in order to provide some background and context on the economy in which the MFP slowdown took place. As just noted, MFP growth is a residual: output growth minus the growth of the combined inputs of capital and labor. Figure 3 reveals that, although both output growth and combined input growth atrophied in the slowdown period relative to their higher rates of the speedup period, output growth succumbed to a much more serious retrenchment. Namely, while combined input growth slowed by 0.4 percentage point, output growth slowed 4 times as much, by 1.6 percentage points. The fact that output growth retreated so much further than combined inputs during the slowdown period is reflected in the notably low MFP growth rate of 0.4 percent during this period, and is a key fact connected with the productivity slowdown. For this reason, as we begin our investigation of the MFP slowdown, we will first be looking closely at the historically weak output growth and getting a sense of the state of the economy during this period.



Historically weak output growth of the post-2005 slowdown period

The rate of output growth during the 2005–18 slowdown period (2.1 percent) is a historically weak growth rate. Not only does this rate pale in comparison to the 3.7-percent growth of the speedup period, but it also represents a historically slow rate for the entire post-WWII period, well below the historical average growth rate of 3.4 percent (see figure 3). Of course, a large portion of the below-average output growth in the slowdown period reflects the fact that this period encompasses the global financial crisis and Great Recession of 2007–09 and the subsequent recovery. It might surprise some to discover that the post-2007 business cycle, which contains this historic downturn, not only had slower cyclical growth than all previous business cycles since WWII, but it even recorded a slower overall growth rate than the Great Depression of the 1930s (see figure 4). In the case of the Great Depression, output plummeted by 26 percent—a much more severe decline than the 3-percent decline during the Great Recession.[12] However, the recent cycle exhibited a much weaker recovery than that of the Great Depression, with output growth from 2009 to 2018 being less than one-third of the 7.2-percent rate posted during the peacetime recovery from 1933 to 1940.[13] Because of this extended weak recovery, as of 2018, the post-2007 cycle's growth rate came in slightly below what had occurred during the 1930s—even more striking when one considers that the population growth rate was the same in these two periods.[14]

Figure 4. Output during declines and recoveries, relative to business cycle peak: real GDP index of Great Depression (1929–40) and Great Recession (2007–18)



Click legend items to change data display. Hover over chart to view data.
GDP = gross domestic product.
Source: U.S. Bureau of Labor Statistics.

The historically low output growth of the post-2007 business cycle—and particularly the anemic recovery—was not wholly unexpected. Valerie Cerra and Sweta Chaman Saxena, Carmen M. Reinhart and Kenneth S. Rogoff, and Carmen M. Reinhart and Vincent R. Reinhart show that a permanent loss of output and a lack of rebound to the long-term growth trend often follow financial crises such as the one the United States experienced in 2008.[15] Similarly, the International Monetary Fund (IMF) asserts that output losses arising from banking crises are usually substantial, stating that "typically, output does not recover to its precrisis trend. On average, output falls steadily below its precrisis trend until the third year after the crisis and does not rebound thereafter," although the IMF also clarifies that following this permanent output loss, "medium-term growth rates tend to eventually return to the precrisis rate."[16] Daisuke Ikeda and Takushi Kurozumi offer a story that may underlie this phenomenon, suggesting that an "adverse financial shock tightens firms' financing and thereby dampens their activities, which in turn has a significant negative impact on the economy as a whole by decreasing activities not only on the demand side but also on the supply side of the economy. The effect on the supply side, such as the sectors of research and development (R&D) and technology adoption, induces a persistent decline in [MFP] and thus can cause a permanent decline in output relative to a pre-shock balanced growth path."[17]

James H. Stock and Mark W. Watson look even further back in time, to before the financial crisis, claiming that more than half of the weakness of the recovery is from slower long-term trend growth—due to changing demographics—that was already apparent before the Great Recession.[18] However, they also note that particularly slow government spending (specifically from the phaseout of the American Recovery and

Reinvestment Act and the budget sequestration of 2013, as well as from slow state and local government hiring during the entire recovery) and faltering international demand following the recession also played a role. Ray C. Fair also cites sluggish government spending following the Great Recession, asserting that it was the central factor underlying the weak recovery.[19]

In addition to researchers citing weak fiscal stimulus, other researchers have pointed to limitations on monetary stimulus. Robert E. Hall offers that the zero lower bound on interest rates following the financial crisis presented a limiting factor that had not been operative in prior U.S. recessions.[20] Robert J. Barro also claims that monetary stimulus was insufficient to spur a vigorous recovery.[21]

The drag on MFP growth from the Great Recession

Now that we have an understanding of the recent trends in the measures used to compute MFP growth (in particular the unusually slow output growth of recent years), our first task is to attempt to use this basic information to help us better understand the slowdown in MFP growth. Specifically, we may ask: Could the state of the economy during the slowdown period, as indicated by the atypically low output growth, especially with it running below its potential and capacity during and following the Great Recession, have helped to cause the low MFP growth?

Yes, according to several authors, the weakened state of the economy during much of the 2005–18 slowdown period could be one factor underlying the low MFP growth. As noted earlier, Ikeda and Kurozumi argue that when an economy is operating below its potential, firms may pull back on investment in R&D and new technology.[22] David M. Byrne, Stephen D. Oliner, and Daniel E. Sichel concur, noting that one possible explanation for the productivity slowdown is that "the economy has taken a long time to recover from the financial crisis and Great Recession, as the repair of balance sheets has proceeded slowly and as uncertainty about the pace of the recovery has held back investment."[23] Romain Duval, Gee Hee Hong, and Yannick Timmer agree, postulating that "the combination of pre-existing firm-level financial fragilities and tightening credit conditions made an important contribution to the post-crisis productivity slowdown,"[24] and also that "while most forms of physical capital can be pledged as collateral to get a loan, intangible assets such as R&D or workforce training cannot. Furthermore, investments in intangible assets tend to translate more slowly into sales and to be riskier. Therefore, [their] hypothesis is that credit-constrained firms cut their investment in intangible assets, contributing in part to a sharper productivity slowdown after the crisis."[25]

Waning dynamism: reduced responsiveness to productivity gains at the firm level

At the same time, although the Great Recession and its aftermath have substantially affected recent economic trends, the data clearly show that the productivity slowdown started before the global financial crisis and Great Recession.[26] Looking back at figure 1, we can see that labor productivity grew at a successively lower rate in each consecutive year from 2002 through 2006, descending to well below the long-term average trend by 2006. So, a second question emerges: What might have led to this initial slowing and commencement of the slowdown period, or, more broadly, what factors might have contributed to the productivity slowdown of the entire 2005–18 period, other than the Great Recession and its deficient recovery?

One major finding is that the businesses that have been spurring recent innovations are having difficulty expanding, and thus, their innovations are failing to make a bigger impact on the economy as a whole than would otherwise be the case. Ryan A. Decker, John C. Haltiwanger, Ron S. Jarmin, and Javier Miranda show that, despite the broad slowdown in productivity growth, many firms are actually still seeing strong productivity gains, with innovation having continued to occur at the "productivity frontier" during the slowdown period since the early 2000s, among the firms that are the productivity leaders in their respective industries.[27] The authors reveal this indirectly, by observing that productivity dispersion in the United States has expanded in recent years, which means that a wider gap exists between these leading firms and the laggards. The authors claim that, within the framework of Michael Gort and Steven Klepper, this increased productivity dispersion implies that there has not been a declining pace of innovation.[28]

So then, why are the innovations that have been sparking at these higher-productivity firms not translating into solid economy-wide productivity gains? The answer has to do with how these firms have responded to their productivity windfall. Namely, Decker et al. observe decreased responsiveness to these firm-level productivity bursts as a potential source of the aggregate productivity slowdown, as evidenced by falling rates of job reallocation among these firms.[29] In other words, many of the firms that have been innovating have not similarly been able to scale up and hire more employees commensurate with their improved productivity.

This slump in firm-level reallocation coincides with the timeline of the aggregate productivity slowdown, with Decker et al. finding that "reallocation has declined in all sectors—particularly the high-tech sector—since the early 2000s."[30] In terms of quantifying the impact of this phenomenon, the authors observe that "counterfactual exercises imply that the decline in responsiveness yields a significant drag on aggregate (industry-level) productivity, as much as 2 log points in high-tech manufacturing and more than 5 log points economy-wide in recent years."[31] (Note that we will further explore in depth the slowdown in high-tech manufacturing in the "Industry-level analysis of the U.S. labor productivity slowdown" section of this article, particularly the dramatic slowdown in the computer and electronic products industry.) As for the underlying sources, which may be resulting in these lower rates of reallocation, Decker et al. cite several potential factors: rising adjustment costs, globalization, increased regulation, and declining competition.

The factor of declining competition—as potentially having a stultifying effect upon productivity-enhancing job reallocation—has been of particular interest in the literature, with Jan De Loecker, Jan Eeckhout, and Gabriel Unger outlining this phenomenon in the United States, offering as evidence that average markup costs have nearly tripled—from 21 percent as of 1980 to a level of 61 percent in 2016—in addition to the rate of profits expanding by 8 times its size, from 1 percent to 8 percent.[32] The authors claim that "because passthrough [of cost savings from productivity growth to lower prices for consumers] is lower in the presence of higher market power, the rise in market power will give rise to [a] lower degree of adjustment of the variable inputs, including labor, for the same [productivity] shock process. The rise in market power thus can rationalize the decrease in labor reallocation across firms, even if the observed shocks to firm productivity [have] remained constant."[33]

Gustavo Grullon, Yelena Larkin, and Roni Michaely echo De Loecker et al.'s data and analysis on increasing market power, stating that such findings "are robust to the inclusion of private firms and factors that account for foreign competition, as well as the use of alternative measures of concentration. Overall, [their] findings suggest that the nature of US product markets has undergone a structural shift that has weakened competition."[34]

Furthermore, undergirding these findings regarding expanded market power are findings of not only rising concentration across firms but also rising concentration in ownership across firms, with a few large shareholders in multiple companies in a given industry.[35] Other related findings include relaxed antitrust enforcement, increased mergers and acquisitions, and other restraints on competition, including increases in occupational licensing by states, the growth of land use restrictions, a greater scope of intellectual property law, and increases in lobbying and political rent seeking.[36]

Additionally, it might be of interest that, in a slightly different analysis of the widening productivity dispersion of high-growth and low-growth firms found by Decker et al., Dan Andrews, Chiara Criscuolo, and Peter N. Gal have proposed that "stalling technological diffusion" may be a possible source of this widening productivity dispersion, theorizing that low-growth firms may be having a difficult time integrating new technologies.[37] However, Decker et al. caution and clarify that "while the diffusion hypothesis could play a role, [their] estimates of [MFP] persistence suggest that the group of 'frontier firms' is sufficiently fluid to somewhat limit the diffusion story's explanatory power. Increased adjustment frictions is an alternative, but not mutually exclusive, explanation."[38]

Income inequality

Escalating income inequality may also be a factor underlying the productivity slowdown, according to Jason Furman and Peter Orszag.[39] Namely, though low productivity growth may be leading to rising inequality, it may also be that rising inequality is reducing productivity growth, by stifling "the ability to harness the talents of potential innovators across the income spectrum." The authors caution, however, that "any plausible magnitude for such an effect would fall well short of explaining the 1.0- to 1.5-percentage-point drop in productivity growth."[40] Furman and Orszag further qualify that rising income inequality and low productivity growth may both "have a common cause, namely that reduced competition and reduced dynamism—in part caused by specific policy changes—have contributed to both issues."[41] Some empirical support for Furman and Orszag's hypothesis that income inequality may be a potential factor in sluggish productivity growth has been offered by Ruchir Agarwal and Patrick Gaulé, who examine income disparities on a global scale and observe that "talented individuals born in low- or middle-income countries are systematically less likely to become knowledge producers."[42]

The debate over innovation possibilities in the 21st century

At this point, it should be noted that a weighty qualifier exists with regard to all the foregoing material regarding the MFP slowdown, on the basis of a notably different perspective on the recent data taken by several economists, such as Robert J. Gordon and John G. Fernald.[43] These authors have hypothesized that a productivity slowdown has not occurred per se in recent years. Rather, they contend that a productivity reversion to the "new normal" of lower productivity growth, established in the early 1970s, has occurred.

More specifically, these economists assert that the information technology (IT)-based innovations of recent decades are no match for the world-changing impacts of widespread electricity, the internal combustion engine, and indoor plumbing that emerged in the late 1800s and early 1900s. They claim that productivity growth cannot be expected to sustainably continue on the same high-growth trend that previously had been seen as of the mid-20th century. Furthermore, they regard the productivity speedup of the late 1990s and early 2000s as the true

outlier and the subsequent low productivity growth as merely the expected case in this relatively lower innovation era.

One underlying rationale for this potential story is provided by Joseph A. Tainter.[44] This author offers that, in general, as complexity in a society increases following initial waves of innovation, further innovations become increasingly costly because of diminishing returns. As a result, productivity growth eventually succumbs and recedes below its once torrid pace: “As easier questions are resolved, science moves inevitably to more complex research areas and to larger, costlier organizations,” clarifying that “exponential growth in the size and costliness of science, in fact, is necessary simply to maintain a constant rate of progress.” Nicholas Bloom, Charles I. Jones, John Van Reenen, and Michael Webb offer supporting evidence for this view regarding the United States, asserting that given that the number of researchers has risen exponentially over the last century—increasing by 23 times since 1930—it is apparent that producing innovations has become substantially more costly during this period.[45]

However, at the same time, some other economists have a few qualifiers of their own regarding the hypothesis that we have long been in an essentially low-productivity era. Chad Syverson reminds us that productivity slowdowns did occur between the waves of innovation during the late 1800s and early 1900s, as seminal technologies such as electricity and the internal combustion engine emerged.[46] Ana Paula Cusolito and William F. Maloney add that “while this prior diffusion hardly implies that a second IT wave is imminent, it does show that productivity accelerations from general-purpose technologies do not have to be one-off events. Just because their resultant productivity growth sped up in the late 1990s and early 2000s does not mean it cannot speed up again.”[47]

To sum up this section, from an economy-wide perspective, we can identify several plausible explanations for the slowdown in MFP growth, including

- declining rates of productivity-enhancing job reallocation,
- rising market power and industry concentration,
- greater restraints on competition,
- growing income inequality,
- the drag from the global financial crisis and Great Recession and its weak recovery,
- diminishing returns to innovation relative to that of the late-19th and early to mid-20th centuries, and
- a historically wavelike tendency of innovations.

It appears likely that the MFP slowdown is coalescing from a combination of these factors, though it may not be possible to place them into an integrated framework or decomposition, given that they address the issue of the MFP slowdown from widely different perspectives—some cyclical, some noncyclical, and some more qualitative in nature than quantitative—and as there may be other factors, which have not yet been discovered. However, these factors do provide us with an overall sense of what may be undergirding the slowdown.

It should also be noted that the story of the MFP slowdown does not end here. In the “Industry-level analysis of the U.S. labor productivity slowdown” section of this article, we will analyze the slowdown from an industry-level perspective, investigating the

- large negative contribution from the computer and electronic products industry,

- large negative contributions from the retail and wholesale trade industries, and

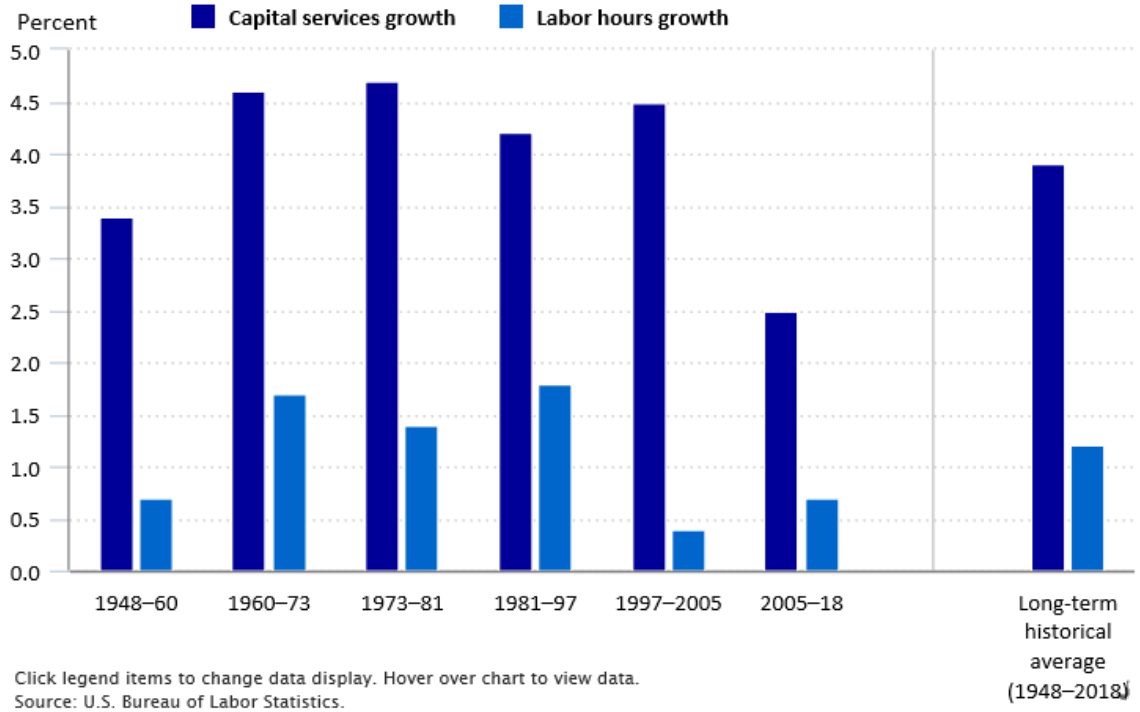
- small negative contributions from most other industries.

The slowdown in the contribution of capital intensity

Alongside the slowdown in MFP growth is the other contributor to the labor productivity slowdown: the contribution of capital intensity. This measure has exhibited an unprecedented variation and, from 2005 to 2018, was cut by nearly half relative to the 1997–2005 speedup period. As noted previously, the contribution of capital intensity grew just 0.7 percent during the 2005–18 slowdown period, which is lower than the 1997–2005 speedup period (1.3 percent) and the historical average rate (0.9 percent). As was also noted, the measure accounts for 34 percent of the labor productivity slowdown relative to that of the speedup period, explains 25 percent of the sluggishness relative to the long-term average percentage rate, and had the lowest growth among all the selected post-WWII periods (see figure 2).[48]

Given that the contribution of capital intensity is calculated as the difference in growth rates between capital and labor inputs, multiplied by the capital cost share, we can determine how much each of these three underlying factors contributed to its slowdown. As shown in figure 5, capital services grew during the slowdown period at a rate of 2.5 percent, which is well below both its rate for the speedup period (4.5 percent) and its long-term average (3.9 percent). Labor hours grew at a rate of 0.7 percent, which lies between its rate for the speedup period (0.4 percent) and its long-term average (1.2 percent). Capital's cost share was 38 percent during the slowdown period, which is higher than during the speedup period (33 percent) and the long-term average rate (34 percent).

Figure 5. Capital services and labor hours: average annual growth rates for selected periods, private nonfarm business sector, 1948–2018



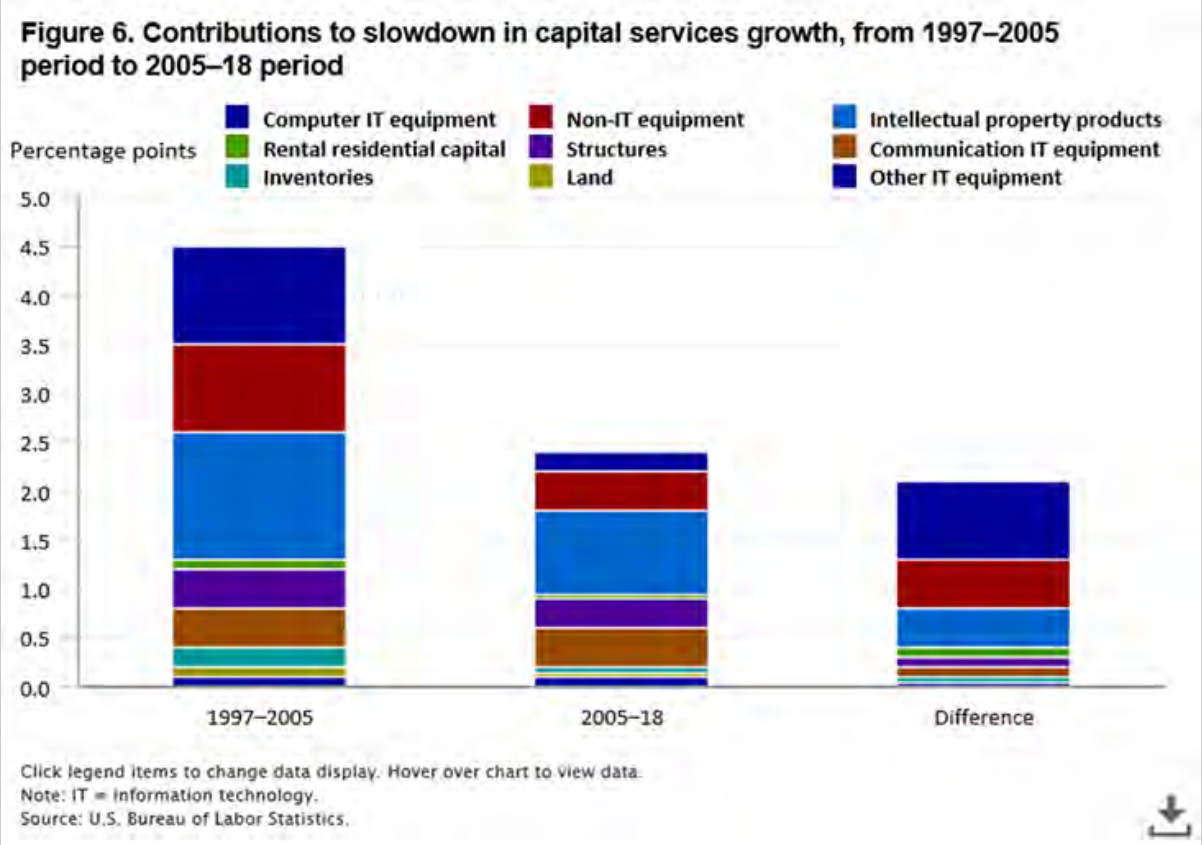
Thus, we can say that it was the combination of a large deceleration in capital services growth with a slight acceleration in labor hours growth that drove down the change in the capital-labor ratio in the slowdown period. This dual effect overwhelmed a slight increase in the capital cost share and diminished the contribution of capital intensity to 0.6 percentage point below what it had been in the speedup period.

At the same time, relative to its long-term trend rate, the sluggishness in the contribution of capital intensity in the slowdown period was comparatively modest—just 0.2 percentage point below its long-term trend rate (see figure 2). Furthermore, the contribution of capital intensity in the slowdown period was not as much of an outlier as it had been during the speedup period, in which it was 0.4 percentage point above the long-term trend during these high-growth years. Nonetheless, both periods exhibited rates that were outside the norm. So, a question arises: What led to such a dramatic acceleration in the contribution of capital intensity and then led to a similarly sized deceleration not just back to normal during the slowdown period, but to slightly below the norm?

To answer the first part of this question, we must look back at the capital and labor components of the contribution of capital intensity during the 1981–97 pre-speedup period (see figure 5). What this reveals is that the vast majority of the acceleration in the contribution of capital intensity from the pre-speedup period to the speedup period was not due to capital services growth expanding but to labor hours growth shrinking. While capital services growth sped up slightly, from 4.2 percent to 4.5 percent, labor hours slowed substantially, from 1.8 percent to 0.4 percent. This drop in labor hours growth is not altogether surprising, given that the speedup period contained both the recession of 2001 and the “jobless recovery” of the early 2000s.

So, it can be said that the change in the capital-to-labor ratio—and thereby the contribution of capital intensity—during the speedup period was boosted up to such a high degree from unusually low labor hours growth, with capital services growth lying not far outside the norm. In contrast, for the slowdown period, it was the inverse: most of the slowing in the measure came from unusually low capital services growth, with labor hours growth not far outside the norm.

We can identify the contributions toward the recent slowdown in capital services growth, which are found in the far right stacked bar in figure 6. As previously noted, capital services growth slowed from 4.5 percent to 2.5 percent during the slowdown period. Of this 2.0-percentage-point deceleration, 0.8 percentage point was from a massive slowdown in computer IT equipment, which shrunk from providing a contribution of 1.0 percentage point in the speedup period to just making a 0.2-percentage-point contribution in the slowdown period. The other two notable contributors to the slowdown were from non-IT equipment (0.5 percentage point) and intellectual property products (0.4 percentage point). In addition, 0.1-percentage-point contributions were from rental residential capital, structures, communication IT equipment, and inventories.



So, what factors may have undergirded such below-average capital services growth during the slowdown period? As noted earlier, Byrne, Oliner, and Sichel assert that the fragile financial condition of the economy following the Great Recession may have hindered investment during the recovery.[49] Robert E. Hall agrees, stating that "at the end of 2013 [the capital stock] was 13.2 percent below its trend path. The crisis and Great Recession, including amplification mechanisms, appear to be responsible for the shortfall."[50] Also, the work of Ravi Bansal, Mariano Max Croce, Wenxi Liao, and Samuel Rosen indicates specifically that uncertainty during and following the Great Recession may have also played a role and, especially, hurt innovative and productivity-driving firms, observing that "volatility shocks are more disruptive for innovation-oriented firms both in terms of market valuation and contraction in their investments. According to the data, when uncertainty increases, there exists a relative reallocation effect that penalizes investments in R&D-intensive firms, that is, investments that are important to sustain long-term growth."[51]

Taking a slightly longer view and analyzing the entire 2005–18 slowdown period, Germán Gutiérrez and Thomas Philippon point out that the U.S. business sector has underinvested relative to "measures of profitability and valuation, particularly Tobin's Q, and that this weakness starts in the early 2000's."[52] In terms of a theoretical underpinning that could explain this phenomenon, the authors specify that although it is possible for firms to underinvest either because of a low Q or despite a high Q, the data do not support the first case. So instead, the authors focus on the latter case, in which they find evidence of three main drivers: "rising intangibles, decreased competition, and changes in corporate governance that encourage payouts instead of investment."[53]

Regarding the rise of intangibles (intellectual property including software, R&D, patents, trademarks, and goodwill) as a share of overall capital investment, Gutiérrez and Philippon estimate that this component "can explain a quarter to a third of the observed investment gap."[54] This is because these assets are both difficult to measure, which may lead to their undercounting, and also "difficult to accumulate, due to higher adjustments costs," leading to "a higher equilibrium value of Q, even if intangibles are correctly measured."[55]

The remainder of the underinvestment likely comes from some combination of decreased competition and changes in corporate governance, according to Gutiérrez and Philippon. Regarding the former, the evidence indicates that "industries with more concentration and more common ownership invest less, even after controlling for current market conditions. Within each industry year, the investment gap is driven by firms that are owned by quasi-indexers and located in industries with more concentration and more common ownership.[56] These firms spend a disproportionate amount of free cash flows buying back their shares."[57] And, in terms of the latter, Gutiérrez and Philippon cite increased shareholder oversight, particularly in guarding against managers' desire to expand capital investments beyond an amount that would be in shareholders' best interests, as well as short-termism, in which "stock-based compensation incentivizes managers to focus on short-term capital gains" via share buybacks rather than making long-term capital investments in their firm.[58]

Annual contributions to the productivity slowdown

In addition to analyzing the labor productivity slowdown from a full-period perspective, as we have done thus far, we can also look at the individual years of the slowdown period itself, to determine how the path of each component developed over time. Figure 7 illustrates how the three series underlying labor productivity growth—MFP growth, the contribution of capital intensity, and the contribution of labor composition—progressed over the course of the slowdown period, from 2005 to 2018.

Figure 7. Contributions to labor productivity growth: MFP growth, contribution of capital intensity, contribution of labor composition, annual growth rates, private nonfarm business sector, 2005–18 period (i.e., annual rates for 2006–18)

MFP = multifactor productivity.
Source: U.S. Bureau of Labor Statistics.

In the first year of the slowdown period—2006, which in figure 7 indicates the growth observed from 2005 to 2006, as we are displaying the growth from one year to the next—MFP growth and the contribution of capital intensity not only had the same rate of growth but they were also similarly below their respective long-term rates. A 0.5-percent increase in MFP in 2006 was below its long-term average of 1.1 percent, and a 0.5-percent increase in contribution of capital intensity was below its long-term average of 0.9 percent. However, over the next few years, it is remarkable how each of these measures diverged as the Great Recession began and wore on. In each year from 2006 through 2009, the contribution of capital intensity incrementally expanded, reaching a series-high 3.2 percent in 2009 and composing the majority of the above-trend labor productivity growth in that year. This acceleration in the contribution of capital intensity was due to an outsized decline in underlying labor hours; although capital services growth slowed from 3.7 percent in 2006 to 1.1 percent in 2009, labor hours growth plummeted from 2.3 percent in 2006 to –7.2 percent in 2009. This difference in magnitudes makes sense, given that it is easier for businesses to lay off workers than sell capital equipment during a recession.

At the same time as the contribution of capital intensity was expanding during the Great Recession, MFP growth was stagnating. After posting a below-average value in 2007 (0.5 percent), the measure sank well into negative territory in 2008 and then edged barely back into positive territory in 2009. What may have brought about this below-average MFP growth during the Great Recession? John G. Fernald notes that “Factor utilization . . . ‘explains’ the plunge and rebound in [MFP]. Utilization fell below the range of historical experience in the recession, [and] then recovered rapidly during the recovery.”[59] Nicholas Bloom, Max Floetotto, Nir Jaimovich, Itay Saporta-Eksten, and Stephen J. Terry cite uncertainty, noting that “plant-level [MFP] shocks increased in

variance by 76 percent during the recession" and that "bad times, defined in terms of low growth rates of output, are also uncertain times in terms of increased cross-sectional dispersion of [MFP] shocks."[60] In addition, Lucia Foster, Cheryl Grim, and John Haltiwanger claim that the Great Recession was an atypically detrimental recession in terms of its effect on MFP growth, in that there was not the usual boost from increased reallocation, which most recessions offer; the authors show that "the intensity of reallocation fell rather than rose and the reallocation that did occur was less productivity enhancing than in prior recessions."[61]

Following the end of the Great Recession in 2009, we observe another year of strong labor productivity growth (3.4 percent) in 2010, though with a sudden reversal in the underlying contributions: MFP growth and the contribution of capital intensity were virtually mirror images of one another in those 2 years, with MFP growth accelerating from 0.2 percent in 2009 to 2.7 percent in 2010 and the contribution of capital intensity slowing from 3.2 percent in 2009 to 0.3 percent in 2010. What might have brought about this result? As noted earlier, Fernald cites increased utilization as a potential explanation for the rebound in MFP growth during this early phase of the recovery.[62] Also, it is often the case when emerging from a recession—especially one as severe as the Great Recession—that firms may still remain apprehensive about hiring until the recovery begins in earnest, with a lag in employment recovery relative to output recovery. This was the case with the recovery from the Great Recession, with labor hours falling for an additional quarter more than output, in the third quarter of 2009, and then remaining virtually flat for two additional quarters—while output was simultaneously rising—and hours not beginning to recover in earnest until the second quarter of 2010.[63] This lag in the labor hours recovery contributed to both the dramatic increase of MFP growth in 2010 as well as the diminution of the contribution of capital intensity in that year.[64]

In the years following 2010, labor productivity growth stagnated, with an average rate of just 0.8 percent—well below the 2.1-percent long-term average rate since 1947. These early years of the recovery were particularly weak for the underlying measures, with the contribution of capital intensity receding into slightly negative territory in both 2011 and 2012, and MFP posting a decline in 2011 and a 0.1-percent increase in 2013. More recently, the situation has improved somewhat compared with those early years, with labor productivity rising above 1.0 percent during 3 of the last 4 years, though still remaining below the long-term historical trend and thus extending the productivity slowdown for over a decade.[65]

A noteworthy fact about the growth during the historically weak recovery period—specifically, after 2011—is how consistent and steady the growth rates have been during these years, with labor productivity growth staying within a historically narrow range of between 0.3 percent and 1.4 percent. This phenomenon reflects the combination of a steadily weak output recovery and a consistently moderate labor hours recovery. And, in terms of labor productivity growth's underlying series, MFP growth was below average during these years as weak output growth was paired with moderate combined-input growth from labor and capital. And, the contribution of capital intensity was also low throughout these years, as moderately increasing labor hours were paired with similarly moderate capital services growth.

Also, note that, in contrast to its typical steadiness during the full periods (see figure 2), the contribution of labor composition exhibited some within-period variation during the slowdown period from 2005 to 2018 (see figure 7) and thereby slightly amplified the swings in labor productivity during this period. Specifically, the contribution of labor composition rose at above-average rates during the Great Recession, with a high of 0.5 percent in 2008, and then grew at below-average rates since, of 0.1 or 0.2 percent. These shifts in the contribution of labor composition over the slowdown period—particularly within the post-2007 business cycle—are not surprising, given that lower-

skilled or less-experienced workers are more likely to be laid off during recessions and then may gradually be reintegrated into the workforce as a recovery progresses.[66]

Trend comparisons for MFP and the contribution of capital intensity

In addition to determining the extent to which each component series contributed to labor productivity growth within each year of the slowdown period, we can also determine how each of these component series tracked during these years compared with its own previously observed growth trends, particularly its speedup period trend rate (1997–2005) and its long-term trend rate (1948–2005). This analysis allows us to see how much the movements after 2005 either stayed on course with, or diverged from, the growth trends that had been previously and historically observed for these series. We will do this for the two contributors to the slowdown: MFP growth and the contribution of capital intensity.

The path of the MFP index series over the slowdown period, as well as the long-term trend rate and the speedup period trend rate for this series, is shown in figure 8. We see that in 2006 and 2007, MFP was already falling slightly behind both the speedup period and long-term period trend lines, and this gap widened substantially during the recession. Then, in 2010, 1 year of high MFP growth partially shrank the gap, but subsequently, from 2011 to 2018, below-average MFP growth widened the gap substantially. Strikingly, we can see from the figure that every annual movement from 2005 to 2018 other than the gain in 2010 acted to widen the gap, either with a negative annual change or a positive change that was slower than the historical trend.

Source: U.S. Bureau of Labor Statistics.

The contribution of capital intensity index series took a much different path through the slowdown period, as is illustrated by figure 9. As just discussed, the contribution of capital intensity took an inverse path relative to MFP during the Great Recession, with an increase in 2008 and a surge in 2009 that sent the series above both the long-term and speedup period trend lines by 2009. However, the subsequent stagnation in the series, with virtually no growth over the next 4 years, submerged it below both trend lines by 2013 and widened the gap from that point onward. At the same time, note that this cumulative gap in the growth of the contribution of capital intensity was, as of 2018, less than that of MFP, which is cumulatively much further behind its historical trends (see figure 8).

Dollar and time costs of the productivity slowdown

In addition to analyzing the productivity slowdown in terms of percent changes, as we have done up to this point, we may also wonder: how much of a real-world impact did the labor productivity slowdown have in terms of dollars of lower output or hours of lost leisure time, for participants of the U.S. economy? Before undertaking this analysis, we should clarify that it is not possible to know in what combination the additional productivity growth—if growth had continued at average historical rates following 2005, rather than at the low rates we have observed—would have translated into greater output and additional leisure time. However, these calculations give us a sense of the losses that have been incurred by Americans, due to the productivity slowdown.

We will first estimate the loss from the productivity slowdown by assuming that the additional productivity growth (representing the difference between recorded productivity growth and what productivity growth would have been if

rates had continued at average historical rates following 2005) would have all contributed to producing additional output, and we will then make an analysis assuming that the added productivity growth would have all contributed to accumulating additional leisure time.

To estimate the total loss in output, we first ascertain how much total output was produced during the slowdown period. This amount is $175.2 trillion. We can then calculate a hypothetical total output, incorporating a consistent 2.3-percent labor productivity growth rate.[67] This amount is $186.1 trillion. So, the difference in output, representing the loss due to the productivity slowdown, is $10.9 trillion. Furthermore, as there were, on average, 114.6 million workers in the nonfarm business sector during these years, this result translates into a loss of $95,000 in output per worker.[68]

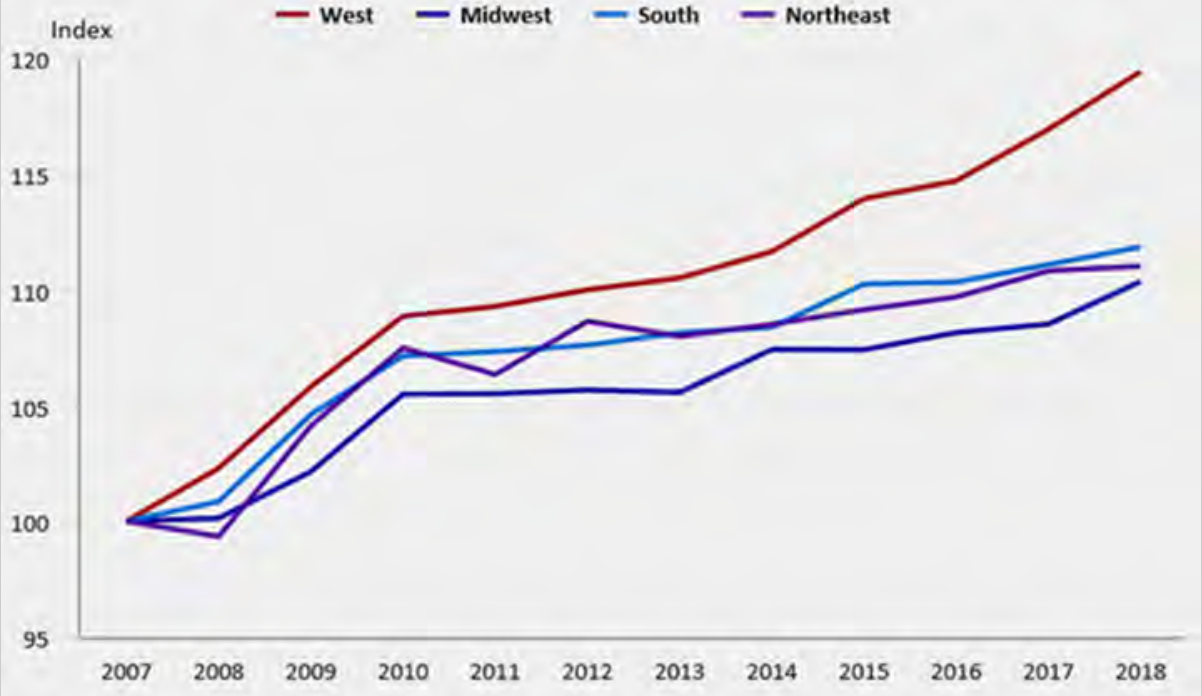
The productivity slowdown can also be framed in terms of lost time, specifically the lost leisure time that could have been available for workers to consume if a slowdown had not occurred.[69] To do this analysis, we first add up all hours worked during the slowdown period, which comes to 2.51 trillion. Then, assuming that labor productivity grew at a consistent rate of 2.3 percent throughout the period and that all of the effect of the added productivity growth contributed to a reduction in hours worked, this calculation would yield a total of 2.37 trillion hypothetical hours worked. Then, subtracting this hypothetical hours figure from the actual hours figure (2.51 trillion) would result in a hypothetical gain of leisure time of 138.5 billion hours, or 1,209 per worker. And, given that the average weekly hours during these years would have been 30.7 in this case,[70] this would result in a total of 39.4 weeks of leave lost because of the slowdown in productivity growth during this period or, correspondingly, 3.0 additional weeks of leave per year.

Did the productivity slowdown progress differently in U.S. regions?

Before we move on to the industry-level analysis, it might be of interest to some readers to know that there was some variation in how the economy-wide productivity slowdown progressed between states and regions of the United States. BLS publishes data on U.S. state and regional labor productivity for 2007 forward, and we can use these data to illustrate how the slowdown progressed in these areas for this portion of the post-2005 slowdown period.*

Box figure 1 tracks the progress of the labor productivity series for the private nonfarm sector in the four U.S. regions during the 2007–18 period. What this figure shows is that the Western United States outperformed the other three regions (Midwest, South, and Northeast) during these years. The West not only outperformed the other regions throughout and following the Great Recession, but its outperformance expanded during the recovery.

Box figure 1. Comparing labor productivity in U.S. regions: output per hour, West, Midwest, South, and Northeast regions, private nonfarm sector, 2007–18



The West realized a 1.6 percent rate of labor productivity growth during these years, whereas the Midwest, South, and Northeast posted rates of 0.9 percent, 1.0 percent, and 1.0 percent, respectively. Given that the national rate for these years is 1.3 percent, we can see that, if not for the faster growth of the West during these years, the overall U.S. slowdown would have been around 0.3 percentage point lower than the already low rate observed during this period. This insight may offer researchers a potential avenue for future research, to look into what potential factors may have contributed to the somewhat higher productivity growth in the Western United States as compared with the rest of the country. At the same time, it is still the case that all four regions posted below-average growth, compared with the national long-term average rate since 1948 of 2.2 percent.

As for the individual states, box figure 2 reveals that, in addition to having the highest overall growth, the Western United States also had the most outliers, both on the high and low end (the figure shows the top six and bottom six state productivity growth rates). Washington, California, Oregon, and Colorado had four of the top six rates, which buoyed the overall growth of the West and more than counterbalanced very low growth in Arizona and Alaska and a decline in Wyoming. North Dakota took the top state rate, at 3.1 percent, and was the only state that had a growth rate that placed above the long-term average U.S. rate of 2.2 percent. As noted by YiLi Chien and Paul Morris, North Dakota underwent an oil boom during these years, “bringing a large influx of capital” to the state, with the authors concluding that the above-average labor productivity growth in this state “is very likely associated with the boom of the oil industry.”** (The turnaround

in this industry, as well as the results of other notable industries, will be discussed in detail in the next section.)

Industry-level analysis of the U.S. labor productivity slowdown

Up to this point, we have analyzed the U.S. labor productivity slowdown from an economy-wide perspective. We can also examine more detailed, industry-level data to extend our analysis and identify the industries that contributed the most to the slowdown in productivity growth from the 1997–2005 period to the 2005–18 period. In

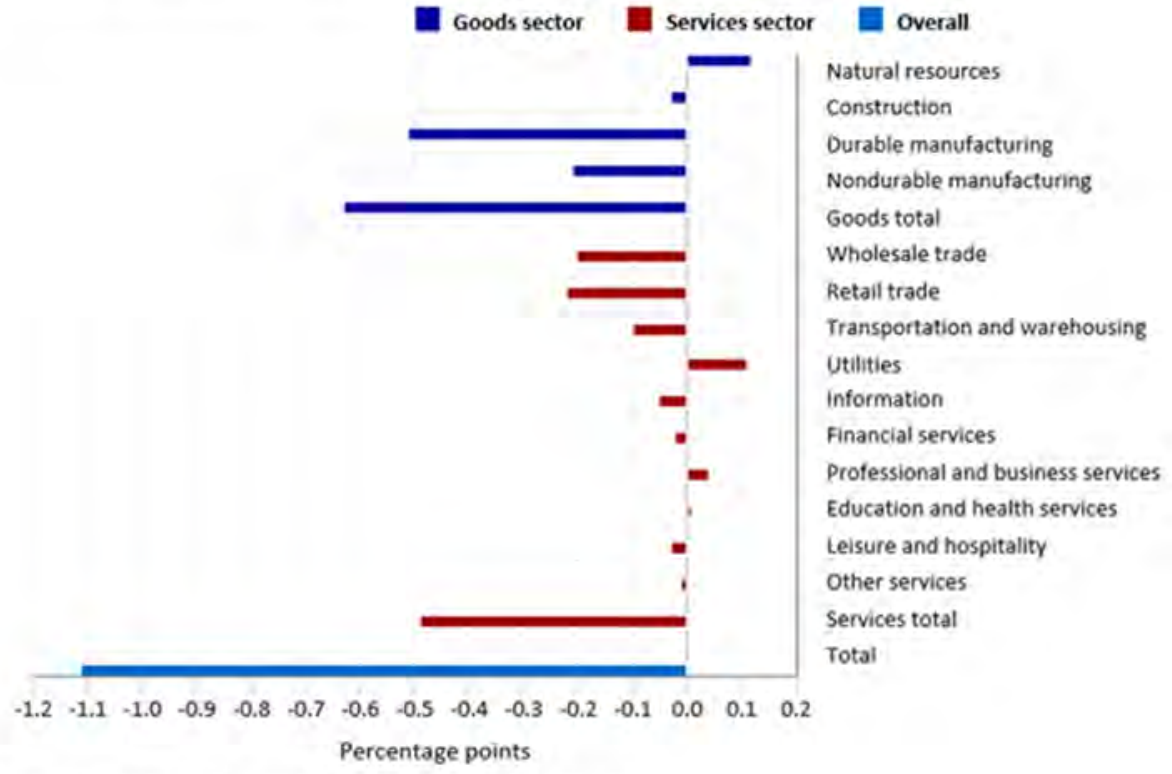
breaking out the U.S. labor productivity slowdown into its industry-level components, we will investigate the two series contributing to the slowdown—MFP growth and the contribution of capital intensity—to determine which industries contributed most to the economy-wide slowdown via these two factors. This can be done by calculating Domar-weighted growth rates of these two factors, for all the industries that make up the private nonfarm business sector.[71] First, we will be looking at the industry contributions to the MFP slowdown, followed by the industry contributions to the slowdown in the contribution of capital intensity.

Industry contributions to the MFP slowdown

When we break out the economy-wide MFP slowdown into its components, it is instructive for us to disaggregate the data into both sectors and industries, because each of these approaches provides a slightly different perspective and can deepen our understanding of the issue. As such, we will first look at contributions at the 14-sector level and then at contributions at the 60-industry level.[72]

The sector-level contributions to the economy-wide MFP slowdown are shown in figure 10, along with the corresponding contributions of the overall goods sector and services sector. First, we notice that the goods sector made a contribution (0.63 percentage point [ppt.]) to the MFP slowdown that is larger than the contribution made by the services sector (0.49 ppt.). The fact that the goods sector made a larger contribution is at first glance somewhat surprising, given that it is much smaller than the services sector and produces just 25 percent of private nonfarm business output. The potency of the contribution from the goods-producing sector can be isolated to the manufacturing sector and, most prominently, durable goods manufacturing, which itself contributed 0.51 ppt., or nearly half the overall contributions to the private nonfarm business sector (1.11 ppt.).[73] When the durable goods sector contribution is combined with the nondurable goods sector contribution, the total manufacturing sector accounted for 65 percent of the private nonfarm business MFP slowdown.

Figure 10. Contributions of sectors to slowdown in MFP growth in private nonfarm business sector, from 1997–2005 period to 2005–18 period



Click legend items to change data display. Hover over chart to view data.
MFP = multifactor productivity.
Source: U.S. Bureau of Labor Statistics.

For the services sector, the largest contributors to the slowdown were retail trade (0.22 ppt.), wholesale trade (0.20 ppt.), and transportation and warehousing (0.10 ppt.). These three sectors together more than explain the overall contribution to the MFP slowdown coming from the services sector (0.49 ppt.), as they made a combined contribution of 0.52 ppt. It is also worth pointing out that two sectors had notable productivity speedups, especially considering their small size—natural resources and mining (0.12 ppt.) and utilities (0.11 ppt.); natural resources and mining makes up just 2.7 percent of the private nonfarm business sector, and utilities makes up just 2.3 percent. Also, though the financial services sector and the professional and business services sector made relatively flat contributions to the slowdown, there were a number of industries within those two sectors that made notable contributions to the slowdown (these industries are discussed below). However, when these industry-level slowdowns are summed with speedups in other industries within the same sector, only a small overall contribution to the slowdown remains for these two sectors.

The industry-level contributions to the economy-wide MFP slowdown are shown in figure 11, specifically for a selection of the largest contributions (positive or negative). (Also, see appendix, table 1, for a full list of industry contributions to the MFP slowdown and industry contributions to the slowdown in the contribution of capital intensity, in the private nonfarm business sector.) It is not surprising that the largest industry-level contributor to the slowdown (computer and electronic products) is from within the largest sector-level contributor to the slowdown (durable manufacturing). Computer and electronic products incurred a massive slowdown, with a contribution to

MFP growth of 0.45 ppt. from 1997 to 2005 dwindling to 0.10 ppt. from 2005 to 2018. A startling fact about this industry is that, even after having the largest MFP slowdown among all the industries, computer and electronic products still possessed a positive contribution and, in fact, the third-largest contribution among all 60 industries during the 2005–18 period, behind only real estate (0.12 ppt.) and oil and gas extraction (0.12 ppt.).[74] The MFP slowdown in computer and electronic products represents 66 percent of the slowdown in durable manufacturing and 31 percent of the slowdown in the private nonfarm business sector.

Figure 11. Industries with largest percentage-point differences in contributions to private nonfarm business sector MFP growth, between 1997–2005 period and 2005–18 period

MFP = multifactor productivity.
Source: U.S. Bureau of Labor Statistics.

Numerous researchers have focused on the historic acceleration and subsequent moderation in the growth of the computer and electronic products industry as being a major driver of the economy-wide productivity slowdown. Many had been aware of the remarkable growth of computer and electronic products in the late 1990s and early 2000s, with Stephen D. Oliner and Daniel E. Sichel observing that the trend at that time was already apparent and strong. They note that “the multifactor productivity contributions from computer and semiconductor producers moved up sharply during 1996–99, reaching 0.26 and 0.39 percentage point per year, respectively,” and that “the increases largely reflect the faster decline in the relative prices of computers and semiconductors . . . and the rising output shares of computer and semiconductor producers.”[75] David M. Byrne and Carol Corrado also

emphasize the rapidly declining prices during those years: “the greatest computer [price] declines, and the greatest gap, occurs [sic] in the 1994 to 2000 period, when [microprocessor unit] prices were falling especially fast.”[76]

Then, however, during the mid-2000s, the pace of microprocessor unit price declines began to stall.[77] And, more recently, price declines have shrunk in size even more, with Byrne and Corrado citing “extremely small declines of late, after having gradually lost force since 2004.”[78] At the same time, Byrne, Oliner, and Sichel argue that there has not been a slowdown in technological progress that the paltry price declines might indicate, clarifying that “technical progress in the semiconductor industry has continued to proceed at a rapid pace.”[79] So, might there be some mismeasurement occurring with regard to these prices? Yes, there was, argue David M. Byrne, John G. Fernald, and Marshall B. Reinsdorf, who say that in “IT-related hardware and software . . . mismeasurement is sizable.”[80]

However, these authors also caution that this measurement was not a new issue in the mid-2000s and that IT price mismeasurement was evident even before the productivity slowdown, clarifying that they “find no evidence that the biases have gotten worse since the early 2000s.”[81] In fact, they point out that, if one were to consistently adjust for mismeasurement across time, it would actually make the labor productivity slowdown worse, given that “mismeasurement of IT hardware [was] significant prior to the slowdown,” and also given that “the domestic production of these products has fallen, [and thus] the quantitative effect [of mismeasurement] on productivity was larger in the 1995–2004 period than since, despite mismeasurement worsening for some types of IT.”[82]

Chad Syverson concurs with Byrne, Fernald, and Reinsdorf, agreeing that mismeasurement is unlikely to be a driver of the productivity slowdown,[83] and observes that “the productivity slowdown has occurred in dozens of countries, and its size is unrelated to measures of the countries’ consumption or production intensities of information and communication technologies [ICTs],” further contending that “if measurement problems were to account for even a modest share of this missing output, the properly measured output and productivity growth rates of industries that produce and service ICTs would have to have been multiples of their measured growth in the data.”

So, what factors might have led to the slowdown in the productivity growth of IT goods? Decker et al. point out that a dwindling of the “marginal employment growth response of businesses to idiosyncratic productivity draws . . . is especially large in the high-tech sector, with the responsiveness of young firms in the post-2000 period only about half (manufacturing) to two thirds (economy-wide) of the peak responsiveness in the 1990s.” The authors conclude that “the timing of reallocation and responsiveness patterns in high-tech is consistent with the timing of the productivity slowdown, which evidence indicates was driven by ICT-producing and using industries.”[84]

The waning responsiveness of young high-tech firms that is cited by Decker et al. could potentially be explained, at least in part, by the work of Mordecai Kurz, who finds growing market power in the IT sector, which may be stifling the entry and growth of young firms.[85] Kurz reports that “declining or slow growing firms with broadly distributed ownership have been replaced by IT based firms with highly concentrated ownership,” and that “IT innovations enable and accelerate the erection of barriers to entry and once erected, IT facilitates maintenance of restraints on competition.”[86] Foster, Grim, Haltiwanger, and Wolf also reference the concentration within high-tech industries, noting that, in contrast to the late 1990s, when “the productivity surge in the high-tech sectors [had] a high contribution of increased within-industry covariance between market share and productivity . . . the productivity slowdown in the post-2000 period in high tech is due to both a decrease in within-firm productivity growth but also

a decrease in this covariance."[87] Titan Alon, David Berger, Robert Dent, and Benjamin Pugsley offer further evidence to support this finding, noting that "over the last three decades, the U.S. business sector has experienced a collapse in the rate of new startups alongside an enormous reallocation of economic activity from entrants and young firms to older incumbents."[88] Alon et al. clarify that this finding is not just particular to high-tech industries but is "widespread across industries and geographic markets,"[89] so that while this could be relevant in high-tech industries, it could also help explain the productivity slowdowns in other industries. And, more generally, Grullon et al. observe that "more than 75% of U.S. industries have experienced an increase in concentration levels over the last two decades."[90]

Beyond the concentration argument, David Autor, David Dorn, Gordon H. Hanson, Gary Pisano, and Pian Shu propose another potential contributor to the productivity slowdown in IT, particularly in IT-intensive manufacturing industries, which is a reduction in U.S. innovation caused by increased foreign competition from China.[91] The authors observe that "despite accounting for less than one-tenth of U.S. private non-farm employment, U.S. manufacturing still generates more than two-thirds of U.S. R&D spending and corporate patents," and claim that "increased imports from China ramped up competitive pressure on publicly listed U.S. firms" and that "this increase in competitive pressure caused U.S. firms to decrease their output of innovations as measured by patent grants."[92] However, this phenomenon is more long-term and may not apply only or specifically to the 2005–18 slowdown period, although it could potentially be a contributor.

Now, shifting gears a bit, let us look beyond the large slowdown in the computer and electronic products industry and examine some other sizable contributors, located in the trade sector. Specifically, retail trade and wholesale trade contributed 0.22 ppt. and 0.20 ppt., respectively, to the MFP slowdown, and when combined, they actually exceed the size of the slowdown in computer and electronic products. These trade sectors transitioned from making sizeable positive contributions to MFP growth during the speedup period to being virtually flat during the slowdown period.

Might the size and coincidence of these slowdowns in the trade sectors and those in the IT-related industries be related? The answer is likely yes, according to several researchers, at least regarding the retail trade sector. Lucia Foster, John Haltiwanger, and C. J. Krizan assert that "the retail trade sector underwent a massive restructuring and reallocation of economic activity in the 1990s. Retail businesses changed their ways of doing business with intensive adoption of advanced information technology, including everything from improvements in inventory control to the introduction and widespread use of scanners and rapid credit card processing technologies. Structural changes occurred with entering establishments from large multiunit national firms displacing single-establishment firms."[93]

These changes were widely seen in the economy, with the proliferation of "big box" stores such as Wal-Mart, Home Depot, and Best Buy that swept the country and displaced many small businesses that could not compete with the advanced IT that these corporations were using.[94] Emek Basker argues that the effect was particularly powerful regarding Wal-Mart, "because Wal-Mart competes with retailers across many categories, including general merchandise stores, drugstores, apparel stores, and grocery stores."[95]

Moreover, Foster et al. contend that, in their firm-level analysis of the dispersion and reallocation dynamics within the retail trade sector, "virtually all of the productivity growth in the retail trade sector over the 1990s is accounted for by more productive entering establishments displacing much less productive exiting establishments," which

they clarify is due to a combination of “selection effects and post-entry learning effects. That is, establishments that enter might be immediately more productive than the establishments they are displacing, or it may take time for the productivity gap to widen or emerge.”[96]

Also, looking beyond the trade sectors and the computer and electronic products industry, we see several other notable downward contributors to the slowdown in MFP growth: Federal Reserve banks and credit intermediation (0.13 ppt.), securities, commodity contracts, and investments (0.11 ppt.), and broadcasting and telecommunications (0.08 ppt.).

In addition, a few industries worked in the opposite direction of the overall slowdown and posted accelerations in MFP growth during this period: oil and gas extraction (0.15 ppt.), real estate (0.13 ppt.), utilities (0.11 ppt.), and rental and leasing services and lessors of intangible assets (0.10 ppt.). The increase for the oil and gas extraction industry during the slowdown period catapulted it from being the 56th ranked industry among all 60 industries as of the speedup period, to a rank of 2 as of the slowdown period. This astounding turnaround, note David Popp, Jacquelyn Pless, Ivan Haščič, and Nick Johnstone, may reflect technological innovations in this industry, in which the “rise of hydrofracturing lowered fossil fuel prices so much that natural gas is now the primary fuel for electricity generation in the U.S.”[97] The real estate industry had a similarly extraordinary turnaround in its MFP growth contribution, rising from a rank of 51 to 1.

Given that there were both negative and positive contributors to the MFP slowdown, with sizable contributors on both sides, it may be of interest to look at the distribution of these industry-level data (see figure 12). The first item to note is that there were more large negative contributors (those slowing by 0.05 ppt or more) than large positive contributors (those expediting by 0.05 ppt. or more). The net slowdown of the large-contributing industries was 0.74 ppt., with 1.39 ppts. of the large contributors on the negative side and 0.66 ppt. on the positive side. The second item worth noting is that the remaining 0.38 ppt. of the slowdown comes from the small contributors—specifically, many more small negative contributors existed than small positive contributors. While just 6 industries contributed between 0.01 and 0.04 ppt., 24 contributed between –0.01 and –0.04 ppt. These negative small contributors had a combined slowdown of 0.44 ppt., greatly outweighing the positive small contributors, which had a combined speedup of just 0.08 ppt. So, we can say that, although there were numerous large contributors to the overall slowdown on the negative side (particularly computer and electronic products and the trade industries), there was also a widespread, generalized negative slide among the vast majority of the industries, which also helped bring about the historic decline in MFP growth.

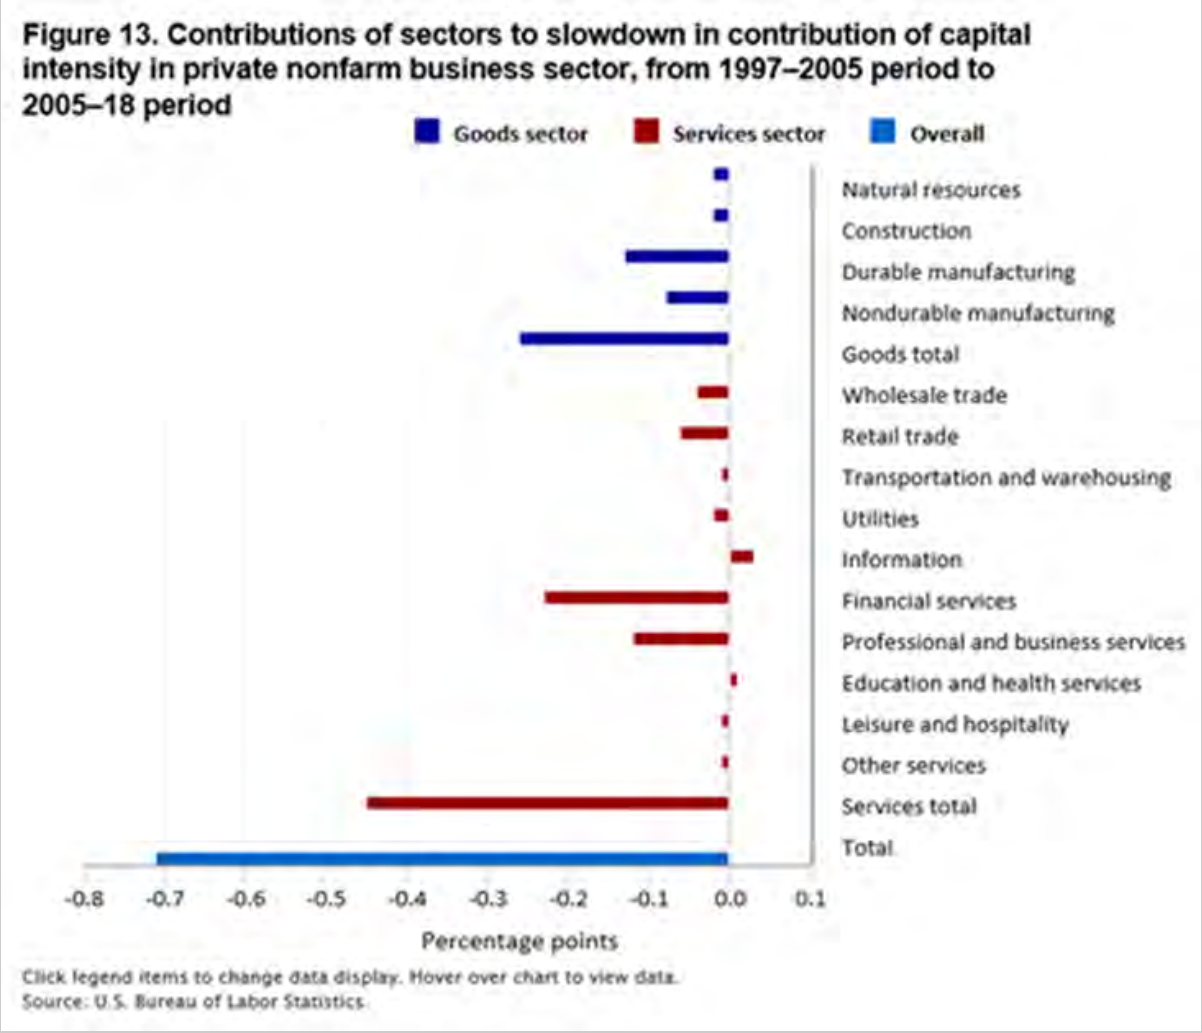
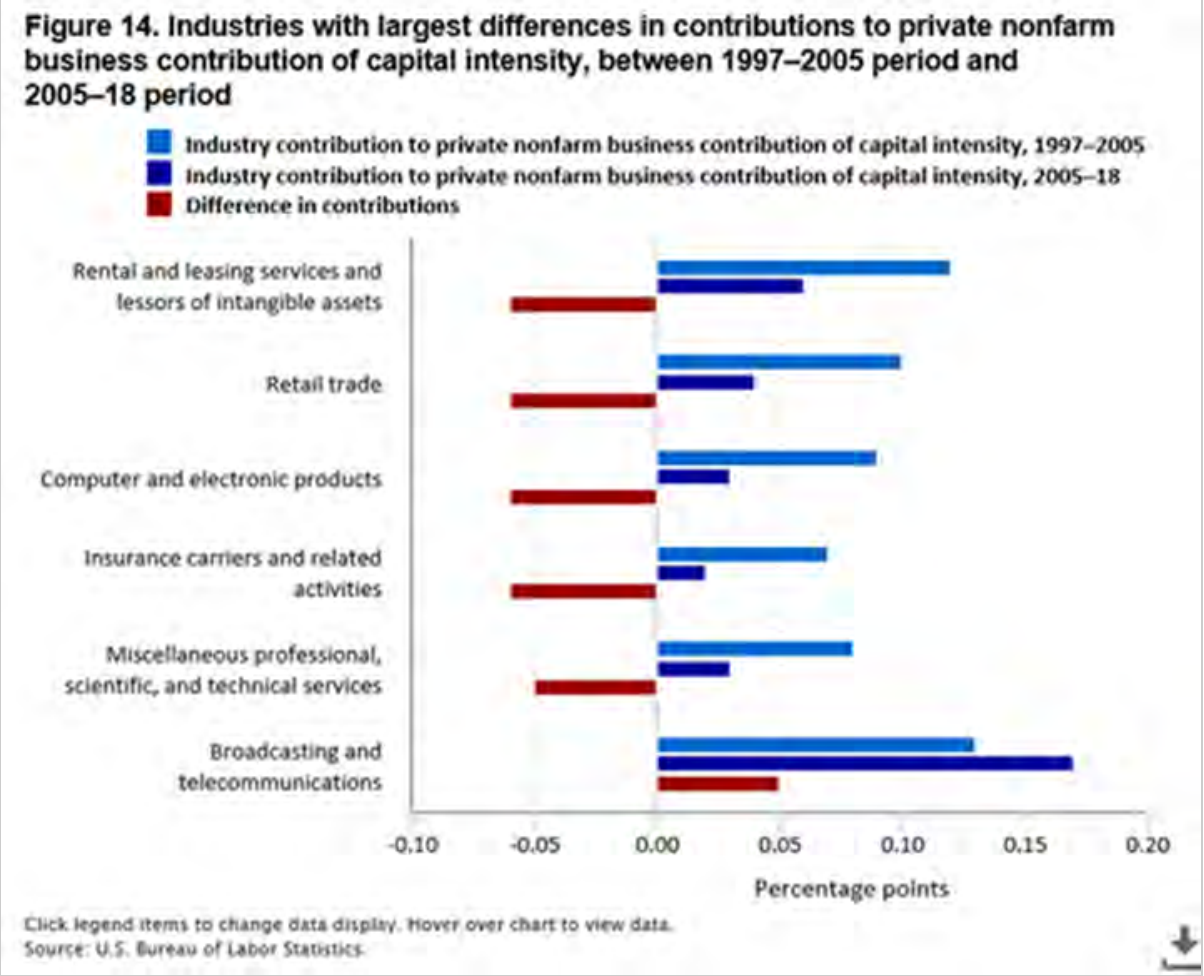
Industry contributions to the slowdown of the contribution of capital intensity

The slowdown in the contribution of capital intensity came more from the services sector than the goods sector. This finding can be seen in figure 13, which shows the sector-level contributions to the overall slowdown in the contribution of capital intensity. The services sector accounted for 0.45 ppt. of the overall slowdown in this measure, with the goods sector contributing 0.26 ppt.



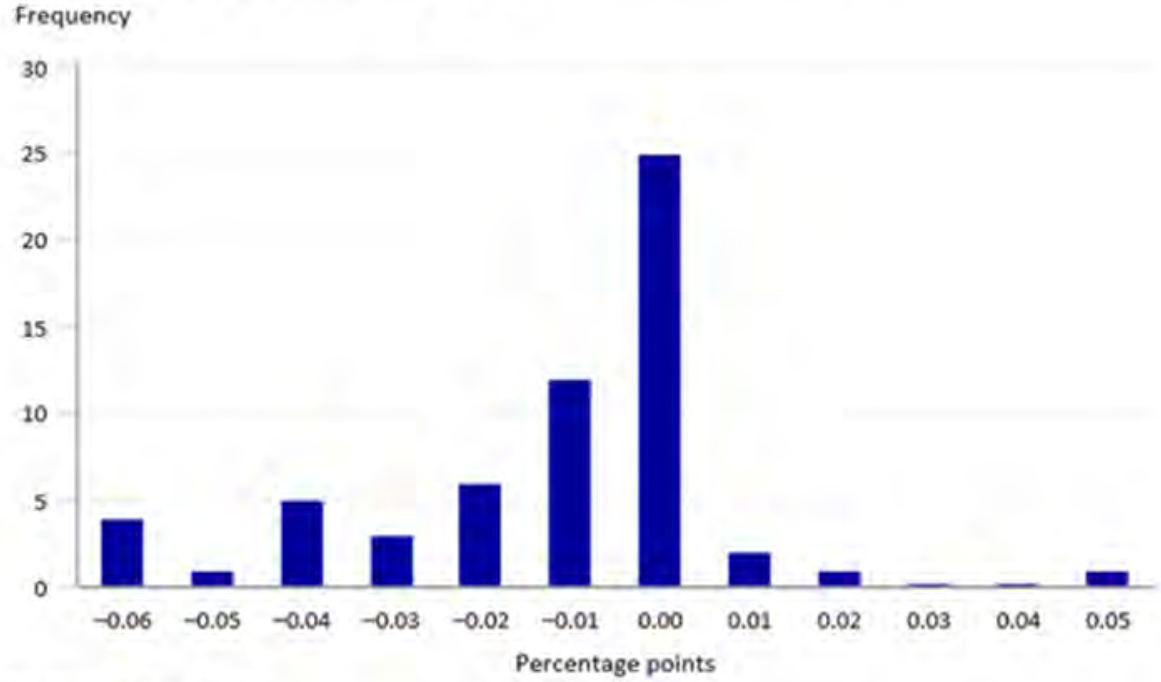
The largest sector contribution to the slowdown was from the financial services sector, with a contribution of 0.23 ppt. There were also noteworthy contributions from professional and business services (0.12 ppt.), durable manufacturing (0.13 ppt.), and nondurable manufacturing (0.08 ppt.).

Figure 14 shows the large industry-level contributions to the slowdown in the contribution of capital intensity, including those with contributions of 0.05 or greater in either direction, positive or negative. Five of the six large contributors were negative and were of similar sizes. The four largest outliers each had slowdowns of 0.06 ppt.; these were rental and leasing services and lessors of intangible assets, retail trade, computer and electronic products, and insurance carriers and related activities. Miscellaneous professional, scientific, and technical services slowed by 0.05 ppt. The broadcasting and telecommunications industry had a speedup of 0.05 ppt.



The distribution of industry contributions to the economy-wide slowdown in the contribution of capital intensity skews heavily negative (see figure 15), with 31 negative contributors and just 4 positive contributors. At the same time, the net contribution to the slowdown from the large contributors (0.24 ppt.) was lower than the net contribution from the small contributors (0.46 ppt.), indicating that there were relatively few outliers with regard to the slowdown in the contribution of capital intensity, especially when compared with the case of the MFP slowdown, which had some substantial outliers. To summarize this section, the bulk of the slowdown in the economy-wide contribution of capital intensity came from relatively small slowdowns in this measure that occurred in a substantial number of industries.

Figure 15. Distribution of percentage-point industry contributions to slowdown in contribution of capital intensity, private nonfarm business sector, from 1997–2005 period to 2005–18 period



Conclusion

At this point, we have a general understanding of the many factors—at both the economy-wide and industry levels—which may underlie the productivity slowdown since the mid-2000s. However, some questions remain, perhaps the most central one being: Is the U.S. economy now, as some researchers have suggested, in an intermittent lull in between waves of high growth, or, as others contend, in a “new normal” of lower growth that has resulted from fundamentally diminished returns to innovation? The answer is not known at the moment, and only time—and additional data in our time series—will tell us.

At the same time, one thing that we can say for certain about our present situation is that the productivity slowdown of the past decade and a half has left the U.S. economy in a weaker position—yielding a sizable loss of potential output during these years—and perhaps even more importantly, it has also left the economy in a weaker position going forward. This is because the productivity slowdown has resulted in a lower base of output from which to grow onward from here, relative to the more elevated starting position that the economy would instead now have if productivity had continued to grow at the long-term historical trend after 2005.

Thus, it will be important for participants of the U.S. economy to keep an eye on productivity data in coming years, to determine whether the slowdown since 2005 simply represented a periodic variation in trend, which can be explained from recent cyclical and noncyclical factors, as some observers have claimed, or whether it comes to be seen as a continuation of the low-growth economy of the last few decades of the 20th century. BLS productivity

data, including labor productivity, multifactor productivity, and capital and labor data, at both the economy-wide and industry levels, will continue to shed light on this issue.

NOTES

1 The overall estimated output loss figure ($10.9 trillion) represents the difference between (1) the sum of annual real output amounts in the nonfarm business sector from 2006 to 2018 and (2) the sum of annual real output amounts during this period assuming that labor productivity had continued to grow at the same long-term average rate observed from 1947 to 2005 and that all of the additional gains in labor productivity contributed to higher output rather than higher nonwork time. For more information on the estimation of this figure, as well as an example in which the additional gains in labor productivity contributed to higher nonwork time rather than higher output, see the section “Dollar and time costs of the productivity slowdown” in this article. Also, note that the loss for the entire U.S economy is likely sizably greater than the presented output loss figure. However, because we cannot measure the productivity of the noncovered sectors that represent the difference (including general government, nonprofit institutions, and private households, which include owner-occupied housing), since the output data for these sectors are not suitable for productivity measurement, we can only estimate what the effect would have been for the 76 percent of the U.S. economy covered by the nonfarm business sector. Also note that the estimated output loss per worker figure ($95,000) does not represent the loss in compensation per worker due to the slowdown, which would have been sizably less than that figure, given that only a portion of output accrues to workers as compensation for their labor. For more information on this aspect, see Michael D. Giandrea and Shawn A. Sprague, “Estimating the U.S. labor share,” Monthly Labor Review, February 2017, https://www.bls.gov/opub/mlr/2017/article/estimating-the-us-labor-share.htm.

2 See figure 2 of Martin Neil Baily and Nicholas Montalbano, “Why is U.S. productivity growth so slow? Possible explanations and policy responses,” Hutchins Center Working Paper 22 (Washington, DC: Brookings Institution, September 2016), p. 4. Baily and Montalbano provide an excellent overview of the productivity slowdown and also offer potential policy responses. In addition, other overviews of the slowdown include Alexander Murray, “What explains the post-2004 U.S. productivity slowdown?” International Productivity Monitor, no. 34, Spring 2018, p. 81–109; and Emily Moss, Ryan Nunn, and Jay Shambaugh, “The slowdown in productivity growth and policies that can restore it,” The Hamilton Project (Washington, DC: Brookings Institution, June 2020).

3 In Dale W. Jorgenson, Mun S. Ho, and Kevin J. Stiroh, “A retrospective look at the U.S. productivity growth resurgence,” Journal of Economic Perspectives, no. 1, vol. 22, Winter 2008, p. 4, the authors offer an anecdote illustrating the changed perspective during this period: “in just four years, from 1997 to 2001, the Congressional Budget Office more than doubled its ten-year projection of nonfarm business productivity growth from 1.2 to 2.7 percent!”

4 All percent changes in this article, unless otherwise noted, refer to average annual percent changes.

5 Although labor productivity growth theoretically provides a foundation for potential gains in worker compensation, it has historically been the case that commensurate gains in worker compensation do not necessarily accompany gains in labor productivity. Since the early 1970s, real hourly compensation growth has lagged far behind labor productivity growth. For more information, see Susan Fleck, John Glaser, and Shawn Sprague, “The compensation−productivity gap: a visual essay,” Monthly Labor Review, January 2011, https://www.bls.gov/opub/mlr/2011/01/art3full.pdf.

6 There are two main ways of dividing time periods when one is doing a historical productivity analysis such as the one in this article: using business cycles or using variation in trends that are apparent in the data. For the present article, I use variation in trends to define the speedup period (1997–2005) and the slowdown period (2005–18). I selected these two periods because they correspond to the periods that are generally discussed in the literature on this issue and because it is apparent from the data that the question at hand (“What were the sources of the slowdown?”) could not be addressed by operating strictly within the macroeconomic business cycle framework. One reason for this is that the industry-level sources of the slowdown exhibited their own trends that did not necessarily fit within the economy-wide business cycles. Another reason is that although using either a cyclical or trend approach for the slowdown period made little difference (because the business cycle that began in 2007 began just 2 years following the beginning

of the trend-based period [2005]), for the speedup period, it appeared to be preferable to use a trend-based approach. This preference was due to the fact that using the business-cycle break (in 2001) would have split the widely cited speedup period (1997–2005) roughly in half, disallowing for a one-to-one comparison of a speedup and slowdown period. If a business cycle approach had been taken instead, then the comparison would have been between two speedup periods (1990–2001 and 2001–07) and one slowdown period (2007–18), as parts of each of those two preceding periods contain a portion of the speedup in the trend, and the industry-level and broad-based changes in the economy during the speedup period from 1997 to 2005 would have been split into two separate periods. It is notable that this disjuncture between business cycles and trend-based periods in terms of the current productivity slowdown did not occur with the last major productivity slowdown, in the 1970s. This widely cited slowdown, which was apparent in the data beginning in 1973, represented both a business cycle break and a clear demarcation between extended periods of high growth (before 1973) and low growth (after 1973). This result contrasts the present slowdown, the period selection of which was not as clear-cut. As for defining the periods since 1947 that occurred before the speedup period (1997–2005), I use a grouped business cycle approach (by grouping adjacent business cycles with similar trends) to make the interperiod comparisons in the figures more concise and make the broad trends over the past 70 years easier to absorb. The fact that the last major productivity slowdown (in the 1970s) had a match between business cycle breaks and trend-period breaks makes the 1948–1997 period somewhat easier to break up into periods. Also, for a strictly business cycle analysis of the present slowdown, see Shawn Sprague, “Below trend: the U.S. productivity slowdown since the Great Recession,” Beyond the Numbers: Productivity, vol. 6, no. 2 (U.S. Bureau of Labor Statistics, January 2017), https://www.bls.gov/opub/btn/volume-6/below-trend-the-us-productivity-slowdown-since-the-great-recession.htm.

7 Multifactor productivity (MFP) data for the U.S. private nonfarm business sector are available on an annual basis, beginning with data for 1948. This sector accounted for approximately 74 percent of the total U.S. economic output (gross domestic product [GDP]) as of 2017. As denoted by the term “business” in the series name, three nonbusiness sectors are excluded from GDP: general government, nonprofit institutions, and private households (including owner-occupied housing). These three sectors are excluded because their output is measured largely with the use of compensation data, which measure an input to production rather than an output from production, thus rendering these sectors inappropriate for productivity measurement. Also, farm sector data are excluded to reduce volatility in the overall measure. And, as denoted by the term “private” in the series name, government enterprises are excluded, because satisfactory capital measures are unavailable for this sector. In addition, note that the term “MFP” is synonymous with “TFP” or total-factor productivity, which is used throughout the economic literature and refers to the same measure. (For more information on this, see the U.S. Bureau of Labor Statistics (BLS) Division of Productivity Research and Program Development Frequently Asked Questions (FAQs) page at https://www.bls.gov/dpr/faqs.htm#Q01). On another note, although for this article we are looking at private nonfarm business MFP growth, which only includes labor and capital as inputs, BLS also publishes other measures of MFP growth, one of which is referred to as KLEMS (K-capital, L-labor, E-energy, M-materials, and S-purchased services), which includes additional inputs as well.

8 Although figure 2 shows a slight shift in the contribution of labor composition (from 0.2 percent to 0.3 percent) from the speedup period to the slowdown period, looking at these data with more precision reveals a trivial shift in the contribution of labor composition during the slowdown, with an upward shift of just 0.01 percentage point, from 0.24 percent in the speedup period to 0.25 percent in the slowdown period.

9 Alistair Dieppe, Neville Francis, and Gene Kindberg-Hanlon observe this phenomenon in both advanced economies and emerging market economies, in the period from 1980 to 2018: “The volatility of labor productivity is largely accounted for by [MFP] across both advanced economies and EMDEs, where [MFP] accounts for 75–80 percent of labor productivity variance. The high proportion of volatility present in [MFP] reflects its role as a residual, explaining all productivity variation not driven by slower-moving developments in the capital stock and human capital.” Alistair Dieppe, Neville Francis, and Gene Kindberg-Hanlon, “A tale of two dynamics: exploring productivity and business-cycle drivers of developed and emerging market economies,” working paper, July 24, 2020, p. 6.

10 For this article, we are looking at private nonfarm business MFP growth, which only includes labor and capital as inputs. However, BLS also publishes other measures of MFP growth that include other inputs, referred to as KLEMS (capital, labor, energy, materials, and services).

11 See Brian Resnick, “Dark matter, humility, and coming to grips with the unknown,” Vox, November 25, 2020.

12 From 1929 to 1933, GDP fell by a cumulative 26.3 percent, whereas from 2007 to 2009, GDP fell by a cumulative 2.7 percent. For more information, see National Data, National Income and Product Accounts (NIPA), Table 1.1.6. Real gross domestic product, chained dollars (U.S. Bureau of Economic Analysis).

13 From 1933 to 1940, GDP grew at an average annual rate of 7.2 percent, and from 2009 second quarter to 2018 fourth quarter, GDP grew at an average annual rate of 2.3 percent. NIPA, Table 1.1.6.

14 The U.S. population grew at an average annual rate of 0.7 percent from 1929 to 1940 and from 2007 to 2018. NIPA, Table 7.1 Selected per capita product and income series in current and chained dollars, line 18 (U.S. Bureau of Economic Analysis).

24 Romain Duval, Gee Hee Hong, and Yannick Timmer, "Financial frictions and the great productivity slowdown," Working Paper 17/129 (International Monetary Fund Working Papers, May 2017), p. 1.

25 Duval et al., "Financial frictions and the great productivity slowdown," p. 17. Intangible assets are nonphysical assets such as intellectual property, including software, research and development, patents, trademarks, and goodwill. Germán Gutiérrez and Thomas Philippon, in "Investment-less growth: an empirical investigation," abstract, Working Paper 22897 (Cambridge, MA: National Bureau of Economic Research, December 2016), also cite decreased investment in intangibles; see section (in this article) "The slowdown in the contribution of capital intensity." In addition to having an indirect effect on the MFP growth measure, as noted by Duval et al., a slowdown in intangibles would also have a direct effect on the contribution of capital intensity measure, by explicitly reducing the numerator of the change in the capital-labor ratio. In addition, the fallout from the Great Recession may have also hampered rates of reallocation—the process of moving more resources toward high-productivity firms and away from low productivity firms—according to Lucia Foster, Cheryl Grim, and John Haltiwanger, "Reallocation in the Great Recession: cleansing or not?" abstract, Working Paper 20427 (Cambridge, MA: National Bureau of Economic Research, August 2014). These authors observe faltering rates of reallocation during the Great Recession, which is the inverse of the typical case for recessions, perhaps indicating that the magnitude of this recession adversely affected prospects for productivity growth. Even worse, they state that "the reallocation

that did occur [during the Great Recession] was less productivity enhancing than in prior recessions." Nicholas Bloom, Max Floetotto, Nir Jaimovich, Itay Saporta-Eksten, and Stephen J. Terry also cite weak rates of reallocation, which they claim is undergirded by an increase in uncertainty during recessions, contending that "increased uncertainty also reduces productivity growth because it reduces the degree of reallocation in the economy. Higher uncertainty leads productive plants to pause expanding and unproductive plants to pause contracting, which in the . . . U.S. economy drives much of aggregate productivity growth." Nicholas Bloom, Max Floetotto, Nir Jaimovich, Itay Saporta-Eksten, and Stephen J. Terry, "Really uncertain business cycles," Working Paper 18245 (Cambridge, MA: National Bureau of Economic Research, July 2012), p. 1–2.

26 John G. Fernald downplays the importance of the Great Recession in the post-2005 productivity slowdown, claiming that "the Great Recession seem[s] less important than trends related to information technology (IT) that predated the Great Recession." See his paper, "Productivity and potential output before, during, and after the Great Recession," Working Paper 2014–15 (Federal Reserve Bank of San Francisco, June 2014). (Note that the effect of IT-intensive industries on the slowdown will be addressed in the "Industry-level analysis of the U.S. labor productivity slowdown" section of this article.)

27 Ryan A. Decker, John C. Haltiwanger, Ron S. Jarmin, and Javier Miranda, "Changing business dynamism and productivity: shocks vs. responsiveness," Working Paper 24236 (Cambridge, MA: National Bureau of Economic Research, January 2018). Also, in addition to the works cited in this section on the topic of productivity dispersion, note that data on productivity dispersion are now available from BLS and the Census Bureau, via the Collaborative Micro-Productivity Project (CMP), which has developed and published experimental statistics on within-industry dispersion. The public-use statistics (referred to as the Dispersion Statistics on Productivity) developed via this project, were released in fall 2019 and cover all four-digit North American Industry Classification System industries in the manufacturing sector. Restricted-use establishment-level data with microbased estimates of productivity as well as its underlying components (e.g., output and input measures) are also available to qualified researchers on approved projects in secure Federal Statistical Research Data Centers. More information on these data can be obtained at https://www.bls.gov/lpc/productivity-dispersion.htm.

Gal, "The global productivity slowdown, technology divergence and public policy: a firm level perspective," Hutchins Center Working Paper 24 (Washington, DC: Brookings Institution, September 2016), https://www.brookings.edu/research/the-global-productivity-slowdown-technology-divergence/, p. 3.

38 Decker et al., "Changing business dynamism and productivity," p. 24. Additionally, there is another widely cited firm-level theory that has been offered to explain the increased productivity dispersion, which is from Adalet McGowan, Andrews, and Millot. Müge Adalet McGowan, Dan Andrews, and Valentine Millot, "Insolvency regimes, zombie firms and capital reallocation," OECD Economics Department Working Papers No. 1399, June 28, 2017. Adalet McGowan et al. remark that the prevalence of so-called "zombie firms," or low-productivity firms that are unable to properly service their debts, have increased in OECD countries since the mid-2000s. The authors hypothesize that the stubborn persistence of these low-growth firms is potentially not only keeping resources from reallocating to high-growth firms, but it is also creating entry barriers and inhibiting the growth of new firms. However, this theory appears not to be relevant specifically for the United States, which, unlike other OECD countries and especially European countries, has actually had a decline in the share of zombie firms in recent years. For more information, see Dan Andrews and Giuseppe Nicoletti, "Confronting the zombies: policies for productivity revival" slide 7, OECD Economic Policy Papers, no. 21 (presented at the Peterson Institute for International Economics, January 23, 2018).

52 Gutiérrez and Philippon, “Investment-less growth,” abstract. Tobin’s Q was first introduced by Nicholas Kaldor in 1966. For more information, see Nicholas Kaldor, “Marginal productivity and the macro-economic theories of distribution: comment on Samuelson and Modigliani,” Review of Economic Studies, vol. 33, no. 4, October 1966, pp. 309–319. It was popularized a decade later, however, by James Tobin, who describes its two quantities: “One, the numerator, is the market valuation: the going price in the market for exchanging existing assets. The other, the denominator, is the replacement or reproduction cost: the price in the market for newly produced commodities. We believe that this ratio has considerable macroeconomic significance and usefulness, as the nexus between financial markets and markets for goods and services.” James Tobin and William C. Brainard, “Asset markets and the cost of capital,” in Economic Progress, Private Values, and Public Policy (Amsterdam: North-Holland Publishing Company, 1977).

63 Sprague, “Below trend,” https://www.bls.gov/opub/btn/volume-6/below-trend-the-us-productivity-slowdown-since-the-great-recession.htm.

64 In 2010, labor hours jumped up by more than 7 percentage points in a single year and transitioned from a 7.2-percent decline in 2009 to a 0.1-percent decline in 2010. This much smaller decline in labor hours growth for 2010 helped shrink the contribution of capital intensity and expand MFP growth compared with what they had been in 2009. Specifically, labor hours growth lowered the contribution of capital intensity in 2010 relative to that of 2009 because its low rate in 2010 (–0.1 percent) was then more similar to the rate for capital services (0.8 percent), thus shrinking the capital-to-labor ratio relative to the ratio of the prior year. In addition, MFP growth was dramatically accelerated as the below-average gains in both labor and capital in that year were paired with rapidly recovering output growth (3.3 percent).

65 Also, note that the low productivity growth of the 2005–18 period itself reduced the long-term rate since 1947 from 2.3 percent—what it had been as of 2005—to 2.1 percent as of 2018.

66 The data underlying the labor composition series bear this phenomenon out during the Great Recession: the labor cost share of workers under 45 and workers without a college degree plunged much more than it did for workers over 45 and workers with a college degree, during the Great Recession.

67 In this case, I use the long-term historical trend rate from 1947 to 2005, which is 2.3 percent, rather than the rate from 1947 to 2018, which is 2.1 percent. This is because, in this exercise, we are attempting to determine what growth would have been after 2005 if it had continued at the rate observed prior to 2005.

68 This per-worker loss in output technically should be viewed in terms of productivity analysis, with the output loss being represented relative to this input to production. Furthermore, the loss in output per worker does not equate to the loss in compensation per worker, which would have been a lesser amount, as only a portion of output accrues to workers as compensation for their labor. Giandrea and Sprague, “Estimating the U.S. labor share,” https://doi.org/10.21916/mlr.2017.7.

69 Note that, in this hypothetical case, some of this additional leisure or nonwork time could have been the result of layoffs (which could have resulted in unemployment, voluntary retirement from work, or, for some workers, another job), to the extent that the reduction in overall hours was distributed inequitably among workers and reduced employment rather than average weekly hours. To the extent that average weekly hours were reduced, this could have come in the form of increased vacation or sick leave offered and taken, a reduction in the workweek, or a transition from full-time to part-time work for some workers.

70 For this computation of hypothetical average weekly hours, we are assuming that all the reduction in overall hours went to a reduction in average weekly hours and not to employment. This approach was taken to show the additional leisure or nonwork time that would have been hypothetically available for this group of workers who were employed during 2005–18.

71 Evsey D. Domar, “On the measurement of technological change,” Economic Journal, vol. 71, no. 284, December 1961, pp. 709–729. In his article, Domar developed a method for estimating industry contributions to overall MFP growth for an aggregate sector. I use this approach for breaking out industry contributions to private nonfarm business MFP growth. Domar showed that a given industry’s contribution to an aggregate MFP growth rate is equal to the MFP growth rate for that industry, multiplied by a two-period average of the ratio of output in the industry to value-added in the sector. The sum of the Domar-weighted industry MFP growth rates approximates the private nonfarm business MFP growth rate. Also, to calculate the industry contributions to the private nonfarm business contribution of capital intensity, I use an approach that uses Domar’s general approach and allows for the breakout of this component. For more information regarding this approach, see Robert Inklaar, Mary O’Mahony, and Marcel Timmer, “ICT and Europe’s productivity performance industry-level growth account comparisons with the United States,” Groningen Growth and Development Centre (GGDC) Research Memorandum GD-68 (Netherlands: University of Groningen, GGDC, December 2003), pp. 12–13.

72 Farm industries are excluded from our analysis in this article, as we are looking at the contributions to the private nonfarm business sector.

73 The summed MFP contributions, using the Domar method, add to 1.11 percentage points, which is slightly different from the top-line private nonfarm business slowdown of 1.27 percentage points. For this section of the article, I use the 1.11 figure as the overall value because it is consistent with the summed contributions.

74 Byrne et al. report that “since 2004 IT has continued to make a significant contribution to U.S. labour productivity growth, though it is no longer providing the boost that it did during the productivity resurgence from 1995 to 2004.” See Byrne et al., “Is the information technology revolution over?” abstract.

Are temporary layoffs becoming permanent during COVID-19?

Cody Parkinson

Job loss during the coronavirus disease 2019 (COVID-19) pandemic has been catastrophic. Firm–worker relationships are important in determining how quickly the U.S. economy will recover. In "Temporary layoffs and unemployment in the pandemic" (*FRBSF Economic Letter*, Federal Reserve Bank of San Francisco, November 16, 2020), Erin Wolcott, Mitchell G. Ochse, Marianna Kudlyak, and Noah A. Kouchekinia examine unemployment data relating to temporary versus permanent layoffs during the current pandemic and other recent recessions to assess the shape and speed of economic recovery.

Data and definitions from the Current Population Survey (CPS) are used for the analysis. During the survey process, people classified as unemployed are asked a series of questions to determine the reasons for their unemployment. These reasons include being on temporary layoff, permanent layoff, quitting their job, reentering the labor force, and so forth. People on temporary layoff have either received a date to return to work by their employer or expect to be recalled to their job within 6 months. When firms and workers have preestablished relationships, the process for returning to work is generally less time consuming and less costly than situations in which firms and workers need to establish a new employment relationship.

During periods of high unemployment, a higher aggregate share of people on temporary layoff generally signals a more rapid recovery. The authors present data showing that temporary layoffs were the main contributor to the high unemployment rate of 14.7 percent in April 2020. Temporary layoffs contributed 11.5 percent to the total rate, which was the highest contribution of temporary layoffs to total unemployment since at least 1967. In October 2020, temporary layoffs accounted for 2.0 percent of the 6.9 percent unemployment rate. Data from the Survey of Business Uncertainty also confirmed that temporary layoffs contributed to the increase in the unemployment rate. However, reasons for unemployment other than temporary layoffs have increased. If people continue to cycle through periods of joblessness, hold short-term jobs, or remain out of the labor force entirely, then future unemployment could remain persistently elevated.

Using CPS data, the authors can track changes in the labor market status of workers from one month to the next. The data show that the probability of someone moving from temporary layoff to permanent layoff increased during the COVID-19 pandemic but remains low by historical standards. Other than temporary layoffs, the April 2020 unemployment increase was largely attributable to people moving from employed to permanent layoff. However, the proportion of people moving from employed to permanent layoff fell in May and June. The proportion of people moving from out of the labor force to unemployed increased in May and June and has remained around the same level through at least September 2020. The data show that temporary layoffs are generally not turning into permanent layoffs. In addition, while the number of people who are considered long-term unemployed is still lower than the number during the 2007–09 recession, that amount may increase if the pandemic continues.

The authors close by summarizing their findings, stating that despite unemployment being well above prepandemic levels, data do not show that temporary layoffs are becoming permanent. However, as the crisis continues, recovery may slow as people battle persistent types of joblessness.

Has COVID-19 affected mothers' labor market outcomes?

Demetrio Scopelliti

The coronavirus disease 2019 (COVID-19) pandemic has posed several challenges to parents continuing to work while also taking care of children who are unable to attend school or daycare because of safety regulations. While some parents are able to stay with their children by working from home, many work in industries and occupations that require them to work away from home. Because of the duration of the pandemic, childcare concerns have caused some parents in single-parent and multiparent households to consider leaving the labor force, limiting the hours they work in their current jobs, or changing jobs to work in occupations that allow them to work from home.

In "Did Covid-19 disproportionately affect mothers' labor market activity?" authors Daniel Aaronson, Luojia Hu, and Aastha Rajan (Chicago Fed Letter, Federal Reserve Bank of Chicago, January 2021) argue that COVID-19 has adversely affected parents' labor force participation that has disproportionately affected working mothers. Aaronson and colleagues acknowledge that other studies have shown that COVID-19 has not substantially affected parents' labor force participation. However, their assessment of labor market activity of parents (ages 25 to 54) through fall 2020 shows that labor force participation of mothers was 0.6 percentage point lower in the spring and 0.3 percentage point lower in the fall than that of adults in the same age group without kids. This finding means that approximately 120,000 mothers left the labor force in spring 2020 and approximately 60,000 left in fall 2020. In analyzing the demographics of those mothers who chose to leave the labor force beginning in March 2020, the authors found that the negative affect was disproportionately experienced by Black, single, and noncollege-educated mothers, reflecting disparities in the broader labor market over the same period.

Aaronson, Hu, and Rajan note that, while they assert gender disparity in labor market activity during COVID-19, their findings are not consistent with a trend toward the convergence of men's and women's labor market activity in the United States. Although the authors do not discuss the reasons why a gender disparity in labor market activity exists during COVID-19, they suggest that the disparity may be attributed to a higher proportion of women working in service industries, such as leisure and hospitality, that have been drastically affected by COVID-19. Another reason may be that mothers are still predominantly viewed as primary caregivers and more likely to be affected by the absence of children from schools and childcare. The impact on primary caregivers has been further complicated by the duration of the pandemic and safety concerns that have made relying on extended family for assistance more difficult. Regardless, the impact of the COVID-19 pandemic on labor market activity going forward remains to be seen.

How does the labor market for parents change during the COVID-19 pandemic?

Lisa N. Huynh

Differences in labor force participation rates between genders are prevalent within the labor market, but these differences have been amplified with the onset of the coronavirus 2019 disease (COVID-19) pandemic, especially for mothers. In a working paper titled "Parents in a pandemic labor market" (Federal Reserve Bank of San Francisco, Working Paper 2021-04, February 4, 2021), authors Olivia Lofton, Nicolas Petrosky-Nadeau, and Lily Seitelman identify the different labor market outcomes between working men and women and working parents.

Lofton and coauthors find that, overall, employment of men declined by 12 percent compared with 15 percent of women in April 2020 (relative to February 2020). While the initial fall and recovery in employment were similar between nonparent men and women, the initial fall in employment was smaller for fathers than for mothers and nonparents. In addition, recovery prospects for mothers stalled compared with fathers and nonparents. Once the new school year started, recovery halted and the gender employment gap for parents continued to rise, whereas the labor force participation for nonparent women and men remained similar. The authors note that this finding would mean that the employment gap itself was driven more by parent status than by gender differences.

In addition, the authors discover that the labor force participation rates and employment to population ratio disproportionately affected both women and mothers. After controlling for demographic characteristics, the authors observe that these data show that the pandemic had a greater effect (2 times as large) on mothers with less education compared with the effect on college-educated mothers. These data also show that mothers in the lowest income tercile were largely affected (5 times as large) by the pandemic as compared with mothers in the highest income tercile. Interestingly, the age of the youngest child in the household appears not to have affected any labor market outcomes for parents.

Jobs with flexible working hours have helped cushion the overall effect of the pandemic on employment prospects, limiting the decline in employment numbers among mothers. However, simply having the ability to telework has not changed outcomes for either mothers or fathers. The authors find that jobs with flexible working hours are more important than telework capability during a pandemic when parents need to prioritize childcare. Disruptions to a child's schooling can also affect the labor force participation rates of mothers because of the absence of childcare options. In general, the authors note a negative relationship between the degree of the disruption of schooling and the change in the labor force participation rates among mothers and nonparent women.

Unlike its role in previous recessions, the role of childcare during the pandemic recession has been critical in introducing mothers back into the workforce, which suggests that childcare obligations could hold recovery back.

The authors suggest that reopening schools and daycare centers and increasing job flexibility would help recover the labor force participation rates to prepandemic levels and assist the growth prospects during the pandemic.

Consumer inflation during the COVID-19 pandemic

Richard Works

The coronavirus disease 2019 (COVID-19) outbreak of 2020 created an awareness among financial media, academics, and bankers regarding the challenges of measuring inflation during a pandemic. While consumption patterns were affected by social distancing and lockdown mandates, these sudden changes can introduce biases in inflation measures. In "Inflation with Covid consumption baskets" (National Bureau of Economic Research, Working Paper 27352, July 2020), author Alberto Cavallo investigates the impact on inflation measures from changes in expenditures patterns because of the 2020 coronavirus pandemic. The author suggests that "the welfare implications are particularly relevant for lower-income households and [also] extend to countries experiencing a divergence [across] sectoral inflation rates" due to price movements. The term "sectoral inflation" refers to the rise in prices occurring in different commercial sectors of a country. For example, the industries under the transportation sector include new vehicles, motor fuels, used cars and trucks, and car and truck rental.

For this research, Cavallo used data collected on debit and credit card transactions from the Opportunity Insights Tracker (a mechanism that measures the daily change in U.S. consumption patterns). To produce COVID-19 consumer price index (CPI) indexes, he combined real-time expenditure estimates with official inflation measures from January 2019 to May 2020 that were not seasonally adjusted. This data collection was done for several countries, including the United States in which the index data used were produced by the U.S. Bureau of Labor Statistics (BLS). However, Cavallo found that matching data from the Opportunity Insights Tracker to data from various statistical offices from around the world was not always straightforward. For example, some countries that were investigated use a different classification system than the North American Industry Classification System that the United States uses. Thus, to match data from country to country, the author made mathematical assumptions to adjust for the differences in classifications. In addition, he employed Opportunity Insights Tracker data to obtain real-time estimates of expenditures.

From his results, Cavallo discovered that the official CPI from BLS and his calculated COVID-19 CPI were nearly identical in the United States in January and February 2020. But in March of that year (the start of the pandemic's initial outbreak in the United States), the COVID-19 inflation estimate was higher than the official CPI, although both showed deflation. As the pandemic grew, so did the difference between the two inflation rates. The official CPI fell 0.69 percent between March and April compared with the COVID-19 CPI, which decreased only 0.09 percent. Also, in May 2020, the official CPI experienced deflation, whereas the COVID-19 CPI had a positive rate of inflation. Some countries had higher COVID-19 inflation because vastly different price movements occurred across items (and the price divergence happened simultaneously with shifting weights).

Most of the differences between the official inflation measures and the COVID-19 inflation measures were found in spending on food and fuel. One reason for the difference is from expenditure weights that are generally lagged, whereas the COVID-19 CPI used real-time expenditure data. (BLS CPI data, however, are updated every 2 years

for weights.) As Cavallo explains, the “Core CPI” index excludes food and fuel, but the “Covid core” was still higher than the official All items less food and energy CPI in May 2020. These differences were due to less expenditure weight on nonenergy transportation sector subcategories, such as public transportation or new and used motor vehicles, with higher deflation.

The author’s findings suggest that during the coronavirus pandemic, the cost of living increased faster than the cost of living of the official CPI. To examine the household impact, the author used data from the 2018 BLS Consumer Expenditure Survey and then updated weights using monthly data of income quintiles from the Opportunity Insights Tracker. The results showed that low-income households spent more on food than on transportation, which exacerbated the difference in the inflation measures during the beginning of the pandemic. Cavallo suggests that low-income households had higher rates of COVID-19 inflation (1.12 percent in May 2020) during the pandemic when compared with higher income households (only 0.57 percent).

Why has the employment–population ratio declined in the United States?

Lawrence H. Leith

For the past two decades, the employment–population ratio—the percentage of the population that is employed—has been slowly declining in the United States among people of prime working age (ages 25 to 54). The employment–population ratio has declined the most among less educated men, but it has declined among other groups as well. The ratio for prime-age women, for example, rose steadily throughout the post-World War II period and peaked in 2000; it has gradually declined since then. Although the 2001 and 2007–09 recessions—and the impact of the COVID-19 pandemic beginning in early 2020—have exacerbated these declines, they have been driven largely by more long-term economic factors. In a recent article titled "Explaining the decline in the U.S. employment-to-population ratio: a review of the evidence" (Journal of Economic Literature, September 2020), former Commissioner of the U.S. Bureau of Labor Statistics Katharine G. Abraham and her coauthor, economist Melissa S. Kearney, examine these trends for the period from 1999 to 2018 and seek to explain the economic factors driving them.

Abraham and Kearney quantify and rank some of the factors that contributed to the declines in the employment–population ratios among prime-age men and women over the 1999–2018 period. The authors warn that none of the factors they examine work in isolation and are, in fact, interrelated; moreover, they were unable to quantify some of the factors because the evidence was too sparse. Nevertheless, Abraham and Kearney find that "labor demand factors are the most important drivers" of the overall decline in the employment–population ratio among 25- to 54-year-olds over the period. In particular, they cite the marked increased in imported goods from China as the single most important factor driving the decline, reducing the ratio by approximately 0.92 percentage point. The second-largest factor is the increase in automation in the U.S. economy—especially robot technology—which reduces the demand for human labor. The authors estimate that this factor reduced the employment–population ratio for prime-age workers by another 0.43 percentage point over the 20-year period. Other things equal, the more that machines can do what human beings used to do, the more that the percentage of employed people will continue to decline.

Abraham and Kearney also find that labor supply factors have been less important than labor demand factors in the decline of the employment–population ratio for 25- to 54-year-olds over the past two decades. They examine the increase in the number of people receiving Social Security Disability Insurance during the period, for example, and find that it reduced the ratio by 0.09 percentage point. Similarly, the authors look at the Veterans Affairs Disability Compensation program and estimate that its growth reduced the ratio by 0.07 percentage point. The authors note that other "social safety net" programs, such as the Supplemental Nutrition Assistance Program

(formerly known as food stamps) and the Earned Income Tax Credit, had negligible effects on the decline in the employment–population ratio over the 1999–2018 period.

The authors suggest that several other factors warrant further research to determine how much they might also have contributed to the decline in the prime-age employment–population ratio over the past two decades. One such factor involves the challenge that many parents face in reconciling their family and work responsibilities. This challenge is especially relevant for lower wage workers, many of whom often have unpredictable and inflexible schedules. For many parents, the relatively high cost of childcare can make not working more attractive than working. As a result, one parent might choose not to work and instead stay home to care for children. Other factors that Abraham and Kearney suggest warrant further research include increased incarceration rates, stricter licensing requirements, and certain changing social norms, such as young adults in their twenties and beyond living with their parents or other relatives.

Immigration and innovation

The impact of foreign-born workers on the U.S. labor market remains a primary focus of immigration policy and research. In a recent book titled The Roles of Immigrants and Foreign Students in U.S. Science, Innovation, and Entrepreneurship, editors Ina Ganguli, Shulamit Kahn, and Megan MacGarvie offer a collection of eight novel papers presenting recent findings in the literature on immigration economics. The collection provides evidence that (1) foreign-born students still want to work in the United States, although this may be changing for Chinese students, (2) foreign-born students who remain to work in the United States after graduation are positively selected by ability, and (3) the presence of more foreign-born entrepreneurs or employees in a firm is associated with more productivity growth and innovation by most measures.

Ryan Fraser
fraser.ryan@bls.gov

Ryan Fraser is an economist in the Office of Employment and Unemployment Statistics, U.S. Bureau of Labor Statistics.

Many foreign-born students come to the United States to attend top-rated academic institutions. A relevant question with implications for student visa policies is how many foreign students who build human capital in the United States actually remain in the country to use that capital in the U.S. labor market. In chapter 2, Ina Ganguli and Patrick Gaulé estimate that, among Ph.D. students, foreign-born students are more likely to accept postdoctoral appointments in the United States than are native-born students. This difference is robust to test scores and career preferences, suggesting that American educational institutions select students interested in living in the United States. Similarly, in chapter 8, Michael Roach, Henry Sauermann, and John Skrentny show that about 42 percent of foreign-born Ph.D. students wish to stay in the United States permanently and about 37 percent wish to work in the country for some time before returning home. These rates are similar across degree fields, but the average is pulled down by Chinese students, only about 17 percent of whom intend to stay in the United States permanently. The authors urge further study of this difference between

Chinese and other foreign-born students, but they provide ample evidence that immigrants sourced from institutions of higher education have a lasting presence in the United States.

In chapter 1, Stefano Breschi, Francesco Lissoni, and Ernest Miguelez examine why some foreign-born students stay to work in the United States, whereas others return to their home countries. The chapter explores this question by using a novel dataset (based on a data-linkage project between LinkedIn and PatentsView) of patent-holding Indian immigrants employed in the U.S. information and communications technologies (ICT) industry. Using PatentsView, the authors pull data on patents from the top 179 ICT companies. After linking patent holders from these companies to LinkedIn profiles and restricting the sample to Indian inventors whose first move outside of India was to the United States, the authors arrive at a dataset containing around 5,500 such individuals. The analysis explores differences between those who return home and those who stay in the United States, distinguishing between “education” migrants (those who studied at an educational institution at the time of migration) and “work” migrants (those who worked at the time of migration). Breschi, Lissoni, and Miguelez find evidence that return migrants in both the education and work categories are negatively selected with respect to education; that is, those who stay in the United States tend to have higher educational attainment, on average. On the other hand, the authors also find that work migrants who return home are positively selected by the number of patents, implying that those with more patents are more likely to return to India. The authors urge caution in interpreting this mixed result in the absence of further research, but they do demonstrate that many of the latter migrants publish patents and work in the United States for a considerable time.

Given the evidence that many immigrants come to the United States for work, what is their effect on innovation and the firms that hire them? The other papers in the book seek to answer this question. Chapters 3, 4, and 6 explore the relationship between immigration and innovation at the firm level. Because much of the high-skilled immigration to the United States occurs through the H-1B work visa program, which allows the admission of a limited number of immigrants with a college degree up to an annual cap, chapters 3 and 4 focus on the impact of those immigrants.

Using Labor Condition Applications (LCAs), which are documents filed by firms seeking to employ an H-1B worker, Gaurav Khanna and Munseob Lee (chapter 3) compare the performance of firms that file LCAs with the performance of firms that do not. The authors stress that, since filing an LCA is the first step involved in the H-1B program and because not all LCAs are approved, their data reflect a firm’s tendency to hire high-skilled immigrants. For their dependent variable, Khanna and Lee construct a measure of product reallocation that reflects how many products come off and on the market—a measure of creative destruction. The authors find that LCAs are positively associated with product reallocation, with firms that apply for foreign workers more dynamically bringing in new products and taking out old ones. Although causation is difficult to establish, the authors do find that increased LCAs precede greater product reallocation, but periods of greater product reallocation have no correlation with later LCAs.

Anna Maria Mayda et al. (chapter 4) take a similar approach by using a firm’s number of approved H-1B workers as a treatment variable. Through a Freedom of Information Act request filed with the U.S. Citizenship and Immigration Services, the authors obtained data on the entire universe of approved H-1B applications from 1997 to 2012. Their findings, like those reported in chapter 3, suggest that larger companies (based on revenue) have a

higher propensity to employ H-1B workers and that greater revenue growth follows the introduction of more such workers.

Taking a different approach, J. David Brown et al. (chapter 6) examine immigrant-owned tech firms with data from the U.S. Census Bureau American Survey of Entrepreneurs. Since tech firms have relatively high rates of innovation and employ many foreign-born workers, the authors try to estimate the effect of immigrant ownership on innovation. Their measures include product and process innovation, intellectual property, and R&D spending. All measures are positively associated with immigrant ownership, and except for intellectual property, they are significant. Many of the innovation measures, most notably R&D spending, are robust to a myriad of controls.

Academics interested in the relationship between immigration and U.S. scientific and technological innovation should explore the evidence presented in this book. Although the book applies some advanced econometric concepts and may challenge nontechnical audiences, it is a welcome advance in the literature on immigration economics. Those with academic or policy interests concerned with the effects of foreign-born workers on the labor market may find it valuable, and those who wish to add to the literature may benefit from learning more about the novel datasets created by some authors.

April 2021

Employee access to sick leave before and during the COVID-19 pandemic

In response to the coronavirus disease 2019 (COVID-19) pandemic, many private industry employers implemented changes to their sick leave policies. Using data from the U.S. Bureau of Labor Statistics (BLS) National *Compensation Survey and two BLS supplemental surveys,* this article examines changes to sick leave provisions and use before and during the pandemic.

McLeod Brown
brown.mcleod@bls.gov

McLeod Brown is an economist in the Office of Compensation and Working Conditions, U.S. Bureau of Labor Statistics.

Kristen Monaco
kmonaco@fmc.gov

Kristen Monaco was formerly the Associate Commissioner of the Office of Compensation and Working Conditions, U.S. Bureau of Labor Statistics.

The National Compensation Survey (NCS), collected by the U.S. Bureau of Labor Statistics (BLS), is used to produce multiple data outputs, including the Employment Cost Index, employer compensation costs, and employee benefits. The survey is unique in collecting compensation information from employers, gathering data not only on worker wages and salaries but also on employer-provided benefits.[1] Among the benefits collected are various types of employee leave, including sick leave. Information on the incidence and provision of benefits is published annually.

The coronavirus disease 2019 (COVID-19) pandemic resulted in many employers changing their leave policies, affecting sick leave provisions shortly after the NCS reference period in March 2020. To capture data on these pandemic-induced changes, BLS collected two additional surveys: (1) a supplement to the NCS and (2) an establishment survey, called the Business Response Survey (BRS).[2] In this article, we present and analyze data on sick leave provisions and use before and during the pandemic.

Prepandemic information on paid sick leave

To contextualize sick leave changes due to the COVID-19 pandemic, we first provide information on employer-provided sick leave in private industry before the pandemic, relying on NCS data from March 2020. Table 1

presents data—by occupational characteristics, industry, and establishment size—on employee access to sick leave, types of sick leave provisions, and leave combinations.

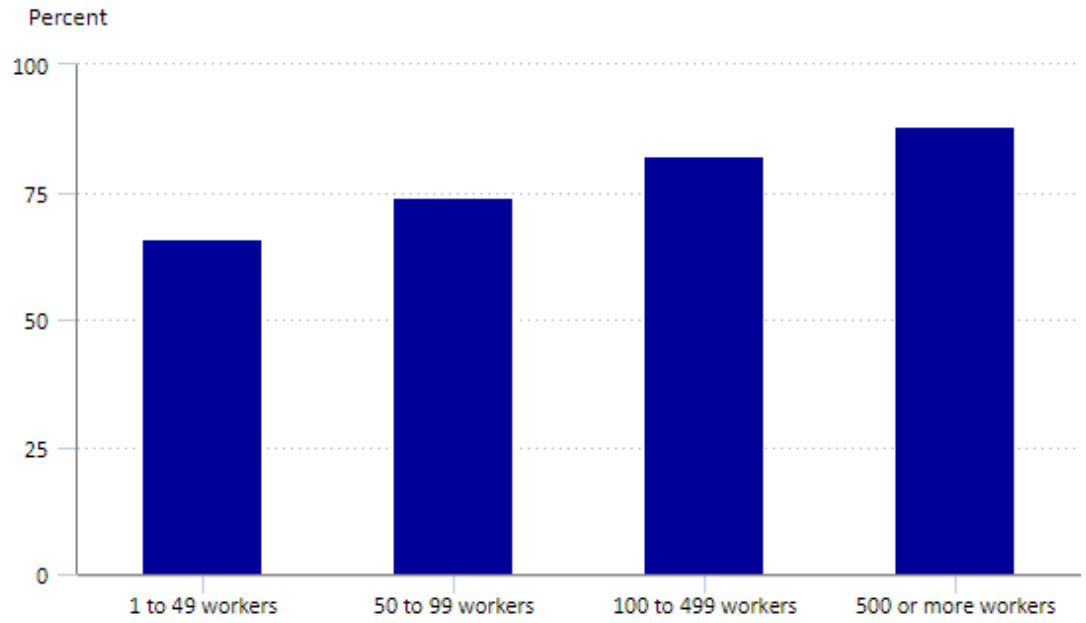
Table 1. Sick leave access, provision type, and combinations of leave benefits, private industry, March 2020

Access to paid sick leave

In March 2020, 75 percent of all private industry workers had access to paid sick leave. Paid sick leave was more prevalent among full-time workers (86 percent) than among part-time workers (45 percent), and it was also more prevalent among union workers (88 percent) than among nonunion workers (74 percent). In addition, access to sick leave varied by occupation, with workers in management, professional, and related occupations having the highest access rate (92 percent) and workers in service occupations having the lowest rate (59 percent).[3]

In terms of establishment characteristics, access to sick leave tended to increase with establishment size. (See chart 1.) In establishments with 1 to 49 workers, 66 percent of workers had access to sick leave, compared with 74 percent in establishments with 50 to 99 workers, 82 percent in establishments with 100 to 499 workers, and 88 percent in establishments with 500 or more workers.[4]

Chart 1. Percentage of workers with access to sick leave, by establishment size, private industry, March 2020



Hover over chart to view data.
Source: U.S. Bureau of Labor Statistics, National Compensation Survey.

Before the pandemic, sick leave access rates also differed by industry. Although table 1 shows that these rates did not vary significantly between goods-producing establishments (74 percent) and service-providing establishments (76 percent), they did vary considerably by industry segment. Looking at two-digit North American Industry Classification System industry sectors, one sees that, in several sectors, about 90 percent of workers had access

to sick leave. These sectors include finance and insurance (97 percent), utilities (96 percent), and professional and technical services (93 percent).

Sick leave provisions

As shown in the leave provisions columns of table 1, among workers with access to sick leave in March 2020, 63 percent were in plans providing a fixed number of days per year, 34 percent were in consolidated leave plans,[5] and 3 percent could take sick leave days as needed, meaning that their plans did not specify a maximum number of days. Plans allowing workers to take days as needed were relatively rare. Six percent of workers in educational services had this plan feature, and this rate was the highest across all published industry sectors.

Access to consolidated leave plans varied by worker and establishment characteristics. Among production, transportation, and material-moving workers with access to sick leave, 24 percent received this benefit as part of a consolidated leave plan, a rate significantly lower than the rates for service workers (30 percent), sales and office workers (37 percent), and workers in management, professional, and related occupations (37 percent).

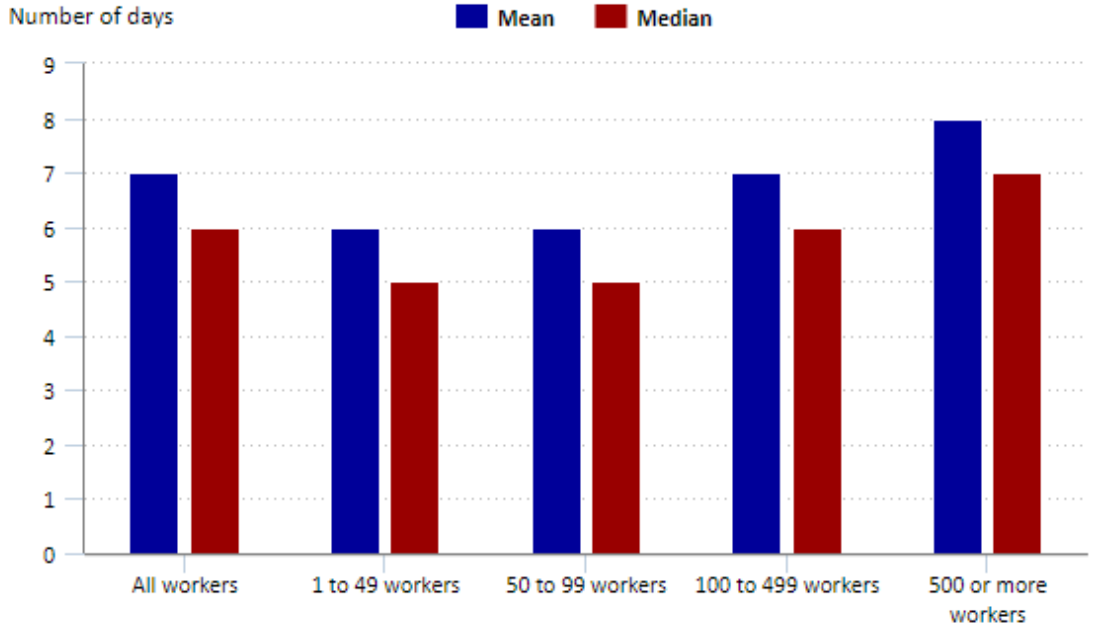
Consolidated leave plans also were more prevalent at larger establishments. In establishments with 1 to 99 workers, 31 percent of workers with sick leave access had a consolidated leave plan, compared with 36 percent of workers in establishments with 100 or more workers. Among industry sectors, the rates of access to consolidated leave plans were 20 percent for workers in leisure and hospitality and 40 percent for workers in financial activities.

How much sick leave did workers receive?

Table 2 presents estimates of mean and median days of paid sick leave by length of service and establishment size. As seen in the table, in March 2020, there was little variation in the amount of leave offered by length of service, especially among smaller establishments. In fact, the mean and median days for establishments with 1 to 49 workers and establishments with 50 to 99 workers were mostly the same across the various categories for length of service. For this reason, we focus on differences in paid sick leave by establishment size for workers with more than 1 year of service. (See chart 2.)

Table 2. Number of annual days of paid sick leave, by service requirement and establishment size, private industry, March 2020

Chart 2. Number of annual days of paid sick leave after 1 year of service, by establishment size, private industry, March 2020



Click legend items to change data display. Hover over chart to view data.
Source: U.S. Bureau of Labor Statistics, National Compensation Survey.

Employees at establishments with 1 to 49 workers and 50 to 99 workers were offered an average of 6 days of sick leave per year, with a median of 5 days. Employees at establishments with 100 to 499 workers were offered an average of 7 days of sick leave, with a median of 6 days. Employees at establishments with 500 or more workers had the most generous sick leave, an average of 8 days per year, with a median of 7 days.

Leave combinations

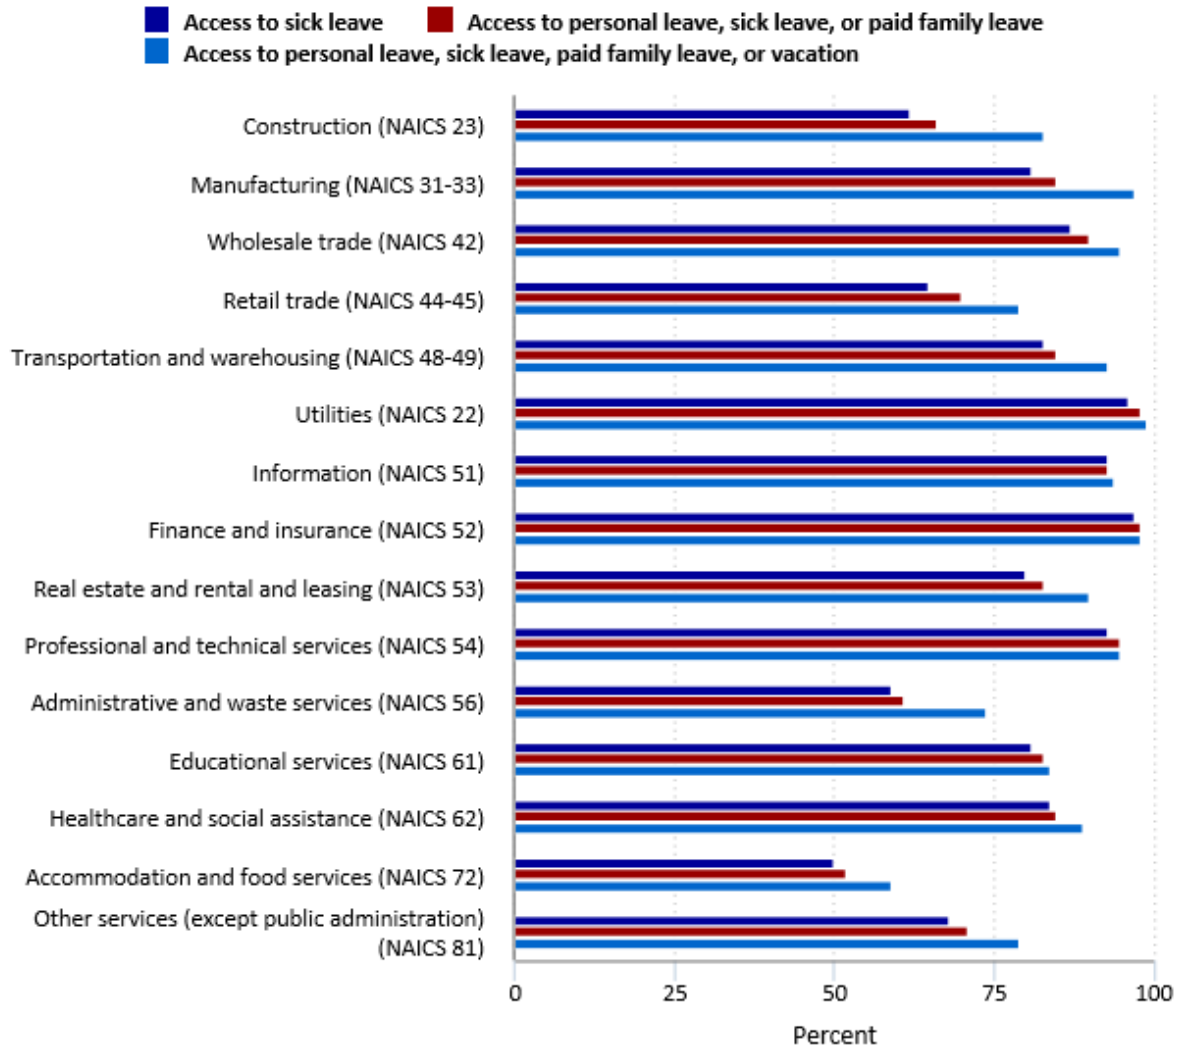
The data on sick leave provisions indicate that, in March 2020, roughly one-third of private industry workers were offered consolidated leave plans. Other workers may have been offered a more traditional leave package distinguishing among different types of paid leave. The last four columns of table 1 focus on access to different combinations of paid leave.

Much like access to sick leave, access to leave combinations varied by establishment size. Before the pandemic, the rate of access to personal leave, sick leave, paid family leave, or vacation was 77 percent at establishments with 1 to 49 workers, 85 percent at establishments with 50 to 99 workers, and 92 percent at establishments with 100 or more workers.

Access to leave including personal leave, sick leave, paid family leave, or vacation also varied by industry, but slightly differently than did access to sick leave alone. (See chart 3.) Although access rates in utilities, finance and insurance, and professional and technical services were relatively high (in the mid- to high 90-percent range), they were found to increase by only a few percentage points with the inclusion of additional forms of leave. This pattern is not surprising, particularly in the case of finance and insurance and professional and technical services, because these industries have relatively high offerings of consolidated leave plans. Workers in manufacturing had access to

sick leave at a rate of 81 percent, but once other leave types were included in the measure, the access rate increased to 97 percent.

Chart 3. Sick leave access and combinations of leave benefits, selected private industries, March 2020



Click legend items to change data display. Hover over chart to view data.
Note: NAICS = North American Industry Classification System.
Source: U.S. Bureau of Labor Statistics, National Compensation Survey.

Workers in accommodation and food services and in construction had relatively low rates of access to sick leave. As seen in table 1, however, with the inclusion of other types of paid leave, the former's rate of leave access rises to 59 percent, an increase of 9 percentage points, and the latter's rate increases to 83 percent, a jump of 21 percentage points.

NCS COVID-19 supplement

In response to the COVID-19 pandemic, BLS added supplemental questions to the NCS, asking employers about leave plan changes due to the pandemic. These questions focused on whether private industry establishments

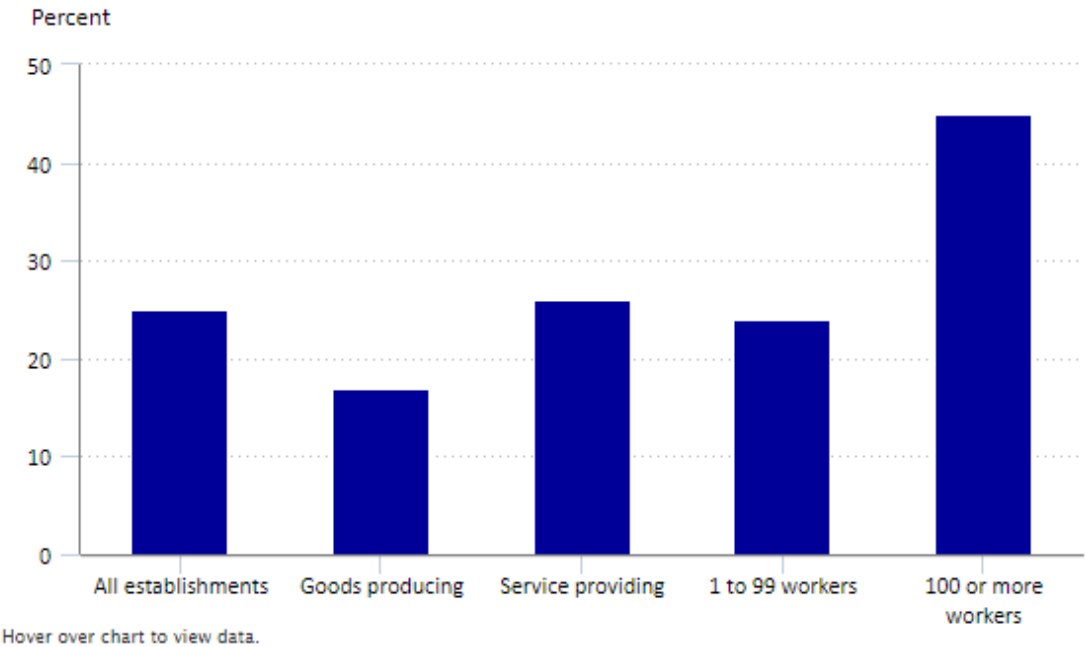
changed their leave policies and on whether employees used sick leave between March 1 and May 31, 2020. Survey data were collected from June 1 to July 21, 2020, representing about 6.5 million private industry establishments from approximately 1,500 responding units in the United States. The response rate was roughly 25 percent.

Unlike the NCS estimates, which capture the share of workers receiving benefits, the supplemental estimates capture establishment shares, because the supplemental data were collected at the establishment, not at the job, level. Since the sample size of the NCS supplement is relatively small, the level of detail provided in the supplemental data is limited. Estimates are presented for all private industry establishments, goods-producing establishments, service-providing establishments, establishments with 1 to 99 workers, and establishments with 100 or more workers.

Changes to paid sick leave or paid-time-off plans

As shown in chart 4, 25 percent of all private industry establishments created or modified paid sick leave or paid-time-off plans because of the COVID-19 pandemic. This rate was 45 percent among establishments with 100 or more workers and 24 percent among establishments with fewer than 100 workers.

Chart 4. Percentage of establishments that created or modified sick leave or paid-time-off plans because of COVID-19, June 2020



Hover over chart to view data.
Note: COVID-19 = coronavirus disease 2019.
Source: U.S. Bureau of Labor Statistics, National Compensation Survey supplement.

How many days of paid leave did establishments add? Table 3 presents the distribution of these additions for the subset of establishments that modified existing paid leave plans or created new plans. Of these establishments, 34 percent added 1 to 5 paid leave days to their plans, 20 percent added 6 to 10 days, and 37 percent added more than 10 days. (The remaining 8 percent had an unknown number of days added.) Among goods-producing establishments, 44 percent added 1 to 5 paid days, 34 percent added 6 to 10 days, and 19 percent added more

than 10 days. Among service-providing establishments, 33 percent added 1 to 5 paid days, 19 percent added 6 to 10 days, and 39 percent added more than 10 days.

Table 3. Percentage of establishments that added paid days to new or existing leave plans because of COVID-19, by number of days added, June 2020

Category	1 to 5 days	6 to 10 days	More than 10 days	Unknown
All establishments	34	20	37	8
Sector				
Goods producing	44	34	19	3
Service providing	33	19	39	9
Establishment size				
1 to 99 workers	37	17	39	8
100 or more workers	9	61	20	10

Note: COVID-19 = coronavirus disease 2019.

Source: U.S. Bureau of Labor Statistics, National Compensation Survey supplement.

Use of sick leave

For the period between March 1 and May 31, 2020, 42 percent of all establishments reported that the average number of sick leave days (paid and unpaid) used per employee was zero. Twenty percent of establishments reported that the average employee used between 1 and 5 sick leave days during the same period, and 10 percent of establishments reported that the average employee used more than 5 sick leave days. Nineteen percent of establishments with 100 or more workers indicated that the average employee used more than 5 sick leave days, compared with 9 percent of establishments with less than 100 workers who reported the same.

Among establishments that modified existing paid and unpaid sick leave plans or created new plans, 90 percent indicated that their plan changes were temporary. The remaining 10 percent either reported that their plan changes were permanent or indicated that they could not provide information on whether the changes would be permanent.

Business Response Survey information on sick leave

The Business Response Survey (BRS) was collected between July 20 and September 30, 2020, leveraging the existing BLS internet data collection portal used for a variety of establishment-level data collections, including the Annual Refiling Survey of the Quarterly Census of Employment and Wages (QCEW). The BRS uses the QCEW as its sampling frame and has a scope of private industry establishments in the 50 states, the District of Columbia, and Puerto Rico.[6] The NCS also uses the QCEW as its sampling frame, but its scope is somewhat different from that of the BRS, most notably in that it excludes agriculture. The usable response rate for the BRS was 27.2 percent, comparable to that of the NCS sick leave supplement.

The reference period for the BRS was from January 1, 2020, to the time the respondent completed the survey. The BRS asked the following question related to sick leave: “As a result of the coronavirus pandemic, did this business location increase the amount of paid sick leave provided to employees?” The answer options included “yes, provided paid sick leave to employees who did not have paid sick leave prior to the coronavirus pandemic”; “yes,

increased amount of paid sick leave for employees who already had sick leave prior to the coronavirus pandemic"; "no change to paid sick leave or no paid sick leave provided"; and "don't know."

Our analysis focuses on the combined "yes" responses, aiding a comparison with the NCS supplement, which aggregated both newly created leave plans and modified existing plans. BRS estimates are presented both as the percentage of establishments adding sick leave and as the percentage of employment in establishments adding sick leave. The former measure is similar to that in the NCS supplement, and the latter is comparable to the March estimate on percentage of workers from the NCS.

Table 4 provides a set of BRS estimates by industry and establishment size. Among all private industry establishments, 14 percent increased sick leave because of COVID-19. This percentage is lower than the NCS supplement estimate of 25 percent. Despite this difference, the patterns by establishment size are similar between the NCS supplement and the BRS, which, because of its larger sample size, provides more granular estimates by establishment size.

Table 4. Sick leave increases due to COVID-19, by industry and establishment size, 2020

Category	Establishments with increased paid sick leave		Employment in establishments with increased paid sick leave	
	Percent	Standard error	Percent	Standard error
Industry

1,000 or more workers	38	1.5	38	1.5

Note: COVID-19 = coronavirus disease 2019; NAICS = North American Industry Classification System.

Source: U.S. Bureau of Labor Statistics, Business Response Survey.

As seen in table 4, initial increases in establishment size correspond to increases in the percentage of establishments that expanded sick leave because of the pandemic. Among establishments with 50 to 99 workers, 30 percent increased the amount of paid sick leave provided to employees. Although the point estimates in the table tend to increase with establishment size, the increases between adjacent size classes are not statistically significant.

While the sample size of the NCS supplement was not large enough to provide estimates by industry, such estimation was possible with the BRS. A pandemic-induced expansion of sick leave was relatively uncommon among establishments in the arts, entertainment, and recreation industry (7 percent) and more common among establishments in the utilities (26 percent) and finance and insurance (21 percent) industries.

As was shown in table 1, workers in utilities and in finance and insurance had relatively high rates of access to sick leave before the pandemic. Chart 5 combines, for selected private industries, the prepandemic sick leave access rates from the NCS with the establishment- and employment-level estimates from the BRS. Industries are sorted by the percentage of employment in establishments that increased sick leave during the pandemic. As seen toward the top of the chart, industries such as utilities and finance and insurance, which had prepandemic sick leave access of 96 and 97 percent, respectively, also had relatively high rates of sick leave expansion during the pandemic. Shown at the bottom of the chart, industries in which employees had relatively low rates of

prepandemic sick leave access, such as administrative and waste services, accommodation and food services, and other services, also had relatively low rates of sick leave expansion during the pandemic.

Chart 5. Access to sick leave and increases in sick leave due to COVID-19, selected private industries

Healthcare numbers for the NCS include social assistance.

There are exceptions to this pattern. For example, although 93 percent of workers in professional and technical services had access to sick leave before the pandemic, only 11 percent of establishments in this industry sector, covering 25 percent of employment, expanded sick leave access because of COVID-19. In retail trade, 65 percent of workers had access to sick leave before the pandemic—one of the lowest industry access rates—but 15 percent of establishments in this industry sector, covering 29 percent of employment, expanded sick leave access because of COVID-19, which places retail trade roughly in the middle of the industry distribution.

Taken as a whole, however, the numbers suggest that establishments that had relatively generous leave benefits before the pandemic were also more likely to expand sick leave during the pandemic.

Conclusion

In this article, we used data from the NCS and two supplemental surveys to examine how sick leave provisions in the private industry changed in response to the COVID-19 pandemic. Our analysis suggests that, after the pandemic hit, 25 percent of private industry establishments created or modified paid sick leave or paid-time-off plans, with 90 percent of these establishments indicating that plan changes would be temporary. In addition, we found that about 14 percent of private industry establishments increased the amount of paid sick leave in response to the pandemic.

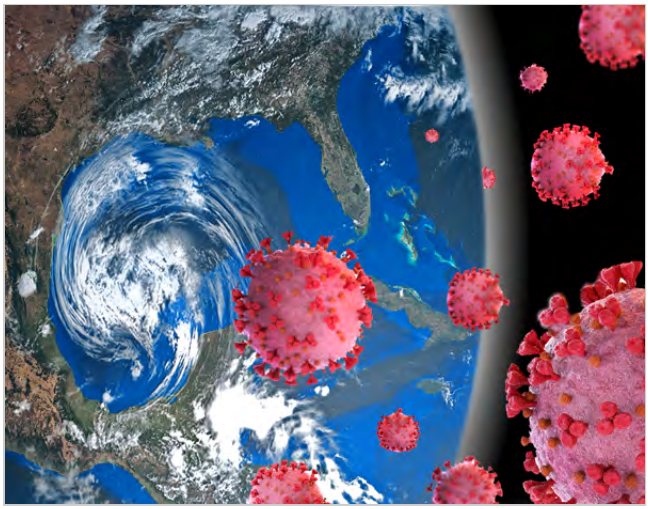
Estimating state and local employment in recent **disasters—from Hurricane Harvey to the COVID-19** pandemic

Natural disasters, including hurricanes, floods, wildfires, and the coronavirus disease 2019 (COVID-19) pandemic, have challenged the standard practices used to produce state and area employment estimates. In some cases, these challenges have led to modifications to the handling of reported business closures, assumptions regarding nonresponse, and the techniques used for modeling employment in domains with small samples for state and metropolitan areas. This article examines how a series of major hurricanes in 2017 and 2018 affected the estimation of state and metropolitan area payroll employment and how lessons learned from these disasters provided a playbook for producing estimates during the COVID-19 pandemic.



Steven M. Mance
mance.steven@bls.gov

Steven M. Mance is a supervisory economist in the Office of Employment and Unemployment Statistics, U.S. Bureau of Labor Statistics.

The U.S. Bureau of Labor Statistics (BLS) Current Employment Statistics (CES) program produces some of the timeliest economic indicators each month, both for the nation as a whole and for varying levels of geographic detail. The CES program conducts a monthly survey of about 144,000 businesses and government agencies representing about 697,000 individual worksites. Respondents to the CES survey provide information on the number of employees, total payroll, and hours paid for the pay period that includes the 12th day of the month. The CES program uses these data to produce estimates of industry employment, hours, and earnings. BLS typically publishes national data within a week of the end of the reference month; data for the 50 states; Washington, DC; Puerto Rico; the U.S. Virgin Islands; and about 450 metropolitan areas are released approximately 2 weeks later.

Natural disasters challenge assumptions built into the employment estimation process regarding nonresponse and the relationship between business openings and closures, and the CES program must address this issue in order to produce accurate data. This article provides an overview of three aspects of the CES methodology that natural disasters confront. It then provides case studies of how the CES program dealt with these questions in developing state and metropolitan area estimates following five recent hurricanes—Harvey, Irma, and Maria in 2017, and

Florence and Michael in 2018—and how the lessons learned from the earlier experience were applied to producing estimates in the early months of the coronavirus disease 2019 (COVID-19) pandemic. (See table 1.)

Table 1. Selected natural disasters that affected state and local employment data

Disaster	Analyzed effect in Current Employment Statistics estimates
Hurricane Harvey	September 2017, Texas
Hurricane Irma	September 2017, Florida
Hurricane Maria	October 2017, Puerto Rico
Hurricane Florence	September 2018, North Carolina and South Carolina
Hurricane Michael	October 2018, Florida and Georgia
COVID-19 pandemic	March and April 2020, 50 states, plus Washington, DC, and Puerto Rico

Source: U.S. Bureau of Labor Statistics.

Note: COVID-19 = coronavirus disease 2019.

CES methodology and natural disasters

The CES program surveys businesses each month and uses the data and a consistent, objective methodology to produce estimates of industry employment, hours, and earnings. The methodology relies on assumptions that are continually evaluated and generally hold in normal times. However, natural disasters are extreme events, and this section explores three ways that such disasters raise questions about the usual CES methodological underpinnings.

Are survey respondents different from nonrespondents?

The CES survey is designed as a probability-based survey.[1] The BLS Quarterly Census of Employment and Wages (QCEW), which contains information on all employers required to participate in the unemployment insurance (UI) system and covers about 97 percent of all nonfarm payroll employment, provides both a sampling frame and the main benchmark source for the CES program.[2] In developing the QCEW as a sample frame, BLS stratifies the data by state, industry, and establishment size. The CES survey randomly selects businesses within these strata, with the inverse of the probability of selection used as the sample weight in estimation. The survey estimates are benchmarked to the administrative QCEW data annually. The difference between the benchmark data and the survey-based estimates—the benchmark revision—is regularly used to assess the accuracy of the CES estimates. After setting benchmark employment levels each year, the CES program estimates monthly employment growth rates with a weighted link-relative estimator. The estimator is essentially the ratio of the current month's weighted employment to that of the prior month in the set of matched respondents that reported nonzero employment for the pay period containing the 12th of both months. The generally small number of active survey units reporting zero employment in either the current or prior month is not used because of assumptions in the business birth–death model (discussed in the next subsection).

Equation 1 provides the weighted link-relative estimate ($\hat{R}_t$) for time t, where ae_i is reported employment for a matched respondent i in n matched sample establishments, w is the sampling weight, and d is a nonresponse weight adjustment (calculated for industries identified to respond at substantially higher or lower rates)[3]:

(1) $$\hat{R}_t = \frac{\sum_{i=1}^{n} w_i \times d_i \times ae_{i,t}}{\sum_{i=1}^{n} w_i \times d_i \times ae_{i,t-1}}.$$

Within each estimating domain (an area or industry combination in which the estimate calculation is performed—other published cells are summaries of estimating cells), the estimator implicitly imputes data for nonrespondents as well as businesses reporting zero employment in the current or prior month by using the growth rates of the matched units. State-level estimates are produced for "estimation supersectors," high-level industries (such as construction or leisure and hospitality) that are estimated directly and control the sum of estimates of more detailed industries. The sample size in these estimation supersectors is large enough to avoid using small-area modeling techniques in most cases, but domain estimates use respondents in businesses from quite different industries (for example, clothing stores, gas stations, and grocery stores mixed together in retail trade).

The implicit imputation follows from the form of the estimator, which does not require explicit imputation, and a missing-at-random assumption within each estimating cell (conditioned on the industries in d_i). The survey respondents stand in for the nonrespondents, and this assumption works well when they are similar, on average.[4]

Natural disasters challenge the missing-at-random assumption. Certain types of businesses—for example, those in federally designated disaster areas—might have more job losses than others in their state because of business disruptions, and they might respond to the CES survey at a lower rate, as other matters take a higher priority. Similarly, certain industries within an estimation supersector may fare differently from one another during a disaster in a way that correlates with response rates, and the same may be true for differences in employment trends and response rates between large and small establishments.

Are business births and deaths properly captured?

The ability to use the QCEW as a frame with a close match to the target population of all nonfarm payroll jobs is one of the CES program's greatest strengths. Two of the program's biggest challenges are accounting for businesses that have opened and closed since the frame was established. It is impossible to sample, enroll, and collect data on business births in real time because the QCEW lags the CES survey by several months. Establishment deaths—defined as worksites that no longer have any payroll employees, which may be temporary or permanent—present a challenge because businesses generally stop reporting when there are no employees. A small number of businesses report establishment deaths; however, they are mainly firms with multiple worksites. These two components of job growth generally offset one another, and the degree to which CES procedures do not capture the residual growth when applied to historical QCEW population data is known as the "net birth–death residual." This value is generally small and stable, and therefore the CES program forecasts historical values with a time-series model for use in estimation. Equation 2 provides the formula for the employment estimate ($\hat{Y}_t$):

(2) $$\hat{Y}_t = \hat{Y}_{t-1} \times \hat{R}_t + BD_t.$$

The CES program multiplies the prior month's employment level ($\hat{Y}_{t-1}$) by the weighted link relative ($\hat{R}_t$) and then adds the current month's forecast value (BD_t).[5]

Natural disasters strain the usual assumptions about business births and deaths. Disaster conditions may halt the formation of new businesses, while forcing many existing businesses to cease operations. But despite disruptions—and sometimes even severe damage to physical locations—many businesses continue to pay employees

through the hardship, mitigating the number of business deaths by CES definitions. Still, the net birth–death residual calculated from the QCEW is often noticeably lower in domains affected by natural disasters, and the forecast error tends to be positive in these cases.

Are small-area models adequate?

The CES program produces estimates with a version of the Fay-Herriot model for estimation supersectors and for many metropolitan areas with small sample sizes.[6] The model estimate is a weighted combination of the direct weighted link-relative estimate and a synthetic component consisting of a historical trend value corrected by a coefficient derived from the regression model in equation 3:

(3) $$Y1_{i,j} = \beta_i \times Y2_{i,j} + e_{i,j}.$$

$Y1_{i,j}$ represents the statewide weighted link-relative estimates for a given industrial supersector (i) and state (j), Y2 represents the corresponding historical trend values, β_i is an estimated coefficient, and $e_{i,j}$ is a model residual. The regression modeling is performed at a statewide supersector level, and the correction factor (β_i) from the state-level model is linked to detailed metropolitan areas. The Fay-Herriot estimate for metropolitan area k is displayed in equation 4:

(4) $$\hat{Y}_{i,k} = W_{i,k} \times Y1_{i,k} + (1 - W_{i,k}) \times \beta_i \times Y2_{i,k}.$$

The weight ($W_{i,k}$) assigned to the direct estimate ($Y1_{i,k}$) is a function of the variance of the direct and trend ($Y2_{i,k}$) components as well as the variance from the state-level model. When the relationship between the direct estimates and the historic trend is looser, the direct estimates receive a higher weight. The correction factor adjusts the historic trend values to the direct estimates roughly on average across the country, but it does not account for any clusters of heterogeneity among states or areas.

This model relies on assumptions about the similarity of industry behavior between areas in order to “borrow strength” across those areas; the model also relies on assumptions about the relationship between statewide and metropolitan area trends.[7] Hurricanes bring these assumptions into stark relief, as some affected states may be dissimilar to the nation as a whole, and even within those states some areas face devastation while others remain unscathed. Similarly, the COVID-19 pandemic affected jobs in states and cities to widely different degrees, despite broad-based shutdowns and job losses.

Five major hurricanes

Although the CES survey began in 1915, and the program has faced many natural disasters since then, the survey has evolved substantially over the years. The CES program fully implemented a probability-based design for the 50 states and Washington, DC, in 2003, BLS assumed responsibility for producing the state and local estimates in 2011, and estimation procedures and models have continued to evolve since then.[8] As a result, the 2017–18 hurricanes provided the best context in which to address estimation issues related to the COVID-19 pandemic.[9]

Several major hurricanes made landfall on the Gulf of Mexico and Atlantic coasts, as well as over U.S. territories in the Caribbean, during the 2017 and 2018 hurricane seasons.[10] The timing of these storms matters because anyone who worked or received pay for any portion of the pay period including the 12th day of the month was counted as employed. Hurricane Harvey made landfall at Port Aransas, Texas, as a category-4 storm, on Friday,

August 25, 2017, and produced heavy rainfall and severe flooding in coastal Texas and other parts of the Gulf Coast, most notably in Louisiana. The system that became Hurricane Irma also formed in August 2017 and made landfall over several Caribbean islands as a category-5 storm in early September; it struck the Florida Keys as a category-4 storm on Sunday, September 10, 2017, and reached the mainland later that day, continuing north along the Florida peninsula. Hurricane Maria formed in September 2017 and caused severe devastation as it made its way through the Caribbean that month. The center of the then-category-5 storm passed just south of St. Croix in the U.S. Virgin Islands on September 19, 2017, before moving diagonally across Puerto Rico the following day.[11] The next year, Hurricane Florence reached category-4 strength and weakened to a category-1 storm, before making landfall on Friday, September 14, 2018, near Wrightsville Beach, North Carolina; it then traveled into South Carolina, causing severe flooding and storm surges in both states. The following month, Hurricane Michael struck the Florida panhandle on Wednesday, October 10, 2018, as a category-5 hurricane.

Hurricanes Harvey and Irma both caused tragic loss of life and rank among the most severe U.S. natural disasters, in terms of property damage. Harvey caused 68 direct deaths in Texas and an estimated $125 billion in property damages in the region. Irma caused 10 direct deaths across three states—7 in Florida, 2 in Georgia, and 1 in South Carolina—and 3 direct deaths in the U.S. Virgin Islands, as well as $50 billion in property damages. The CES survey measured far fewer job losses associated with Harvey than with Irma, however. Texas employment grew in September 2017—adding 14,600 jobs, not far off the prior 12-month average growth of 16,900 jobs—with net job losses in coastal metropolitan areas such as Houston-The Woodlands-Sugar Land, TX (–8,800). The state added 39,300 jobs the following month as businesses bounced back. Florida, by contrast, lost 172,700 jobs in September 2017, before recovering 194,700 jobs the following month. The difference resulted from the timing of the storms. Irma struck Florida at the beginning of the week that included September 12, so workers on a weekly payroll who lost their shifts for 7 days showed up in the estimates as a job loss. By contrast, Harvey hit Texas more than 2 weeks earlier, so only prolonged layoffs resulted in a drop in measured employment in that state.[12] Hurricane Maria, despite hitting Puerto Rico and the Virgin Islands well before the October 2017 reference period, followed closely behind Irma's strike on the territories and caused lasting devastation that was evident in employment data for a prolonged period.

The birth–death model

In normal months, a small number of businesses report zero employment in the CES survey. The rate of reported establishment "deaths" generally follows a stable, seasonal pattern, and some of the deaths are temporary. Following Hurricanes Irma and Maria, the number of establishments reporting zero employment increased sharply. Table 2 shows the proportion of respondents that reported zero employment and compares the forecasted and actual birth–death residuals (later derived from the QCEW) in disaster months. In order to provide frames of reference, table 2 also shows the average proportion of business deaths in the sample over the 2-year period before the disaster and the average absolute monthly forecast error, in terms of employment. The proportion of reported establishment deaths was double the usual rate in Florida following Hurricane Irma and 7 times the usual rate in Puerto Rico following Hurricane Maria. This indicated that the usual birth–death relationship did not hold, and actual birth–death values from the QCEW—calculated several months after the initial release of the CES estimates—were substantially more negative than the forecast values. The forecast error of employment in Florida following Irma was nearly 4 times the average absolute monthly forecast error, while the forecast error for Puerto Rico following Maria was more than 8 times larger than average. Following other major hurricanes, the proportion

of reported establishment deaths was relatively normal, and the birth–death forecasts were closer to their mark and well within normal ranges. (See table 2.)

Table 2. Reported zeros and birth–death forecast errors

Event	Proportion of businesses reporting zero employment		Birth–death forecast error (mean absolute error, 2014–19)	
	Month	Percent	Month	Value (in thousands)
Harvey (Texas)	September 2017	0.23	September 2017	–0.3 (7.9)
	Average, September 2014, 2015, and 2016	0.15		
Irma (Florida)	September 2017	0.40	September 2017	28.4 (7.5)
	Average, September 2014, 2015, and 2016	0.19		
Maria (Puerto Rico)	October 2017	2.20	October 2017	13.8 (1.7)
	Average, October 2014, 2015, and 2016	0.32		
Florence (North Carolina)	September 2018	0.14	September 2018	4.9 (3.6)
	Average, September 2015, 2016, and 2017	0.16		
Florence (South Carolina)	September 2018	0.21	September 2018	–0.5 (2.1)
	Average, September 2 015, 2016, and 2017	0.20		
Michael (Florida)	October 2018	0.22	October 2018	4.5 (7.5)
	Average, October 2015, 2016, and 2017	0.18		
Michael (Georgia)	October 2018	0.13	October 2018	2.3 (5.0)
	Average, October 2015, 2016, and 2017	0.18		
COVID-19 (50 states, plus Washington, DC, and Puerto Rico)	March 2020	0.46	March 2020	Unavailable
	Average, March 2017, 2018, and 2019	0.18		
	April 2020	3.40	April 2020	Unavailable
	Average, April 2017, 2018, and 2019	0.22		

Source: U.S. Bureau of Labor Statistics.

Although reported establishment deaths generally are not used in the estimation process, the seven-fold increase in their rate in Puerto Rico following Hurricane Maria necessitated a different approach. BLS determined the risk of underestimating the number of business deaths to be substantial enough that reported zeros were treated the same as other matched reports and were used in the sample link relative. This change negatively affected the October 2017 employment estimates by 11,800 jobs, nearly offsetting the birth–death forecast error of 13,800. Because many of the closures were temporary, the returns from zero employment were also used in the estimates.

Following Hurricane Irma, the CES program did not initially use reported business deaths in the weighted link-relative estimator for Florida, but after benchmarking the September 2017 employment data, the program recognized that the initial sample-based estimates undercounted the extent of job loss.[13] The QCEW data contained a large increase in the number of establishments reporting zero employment, and had the sample-based estimates used the reported zeros, the estimated employment level would have been 35,000 lower—more closely tracking the population data—which would have accounted for the birth–death forecast error. (The actual value was 28,000 lower than the forecast value.) The CES program included the returns for businesses that had reported declines to zero following Irma in the sample-based estimates that were produced from the new September 2017 benchmark level, increasing Florida employment estimates in October 2017 by 32,000. Including these returns from zero and making other adjustments to account for reporting differences between the CES

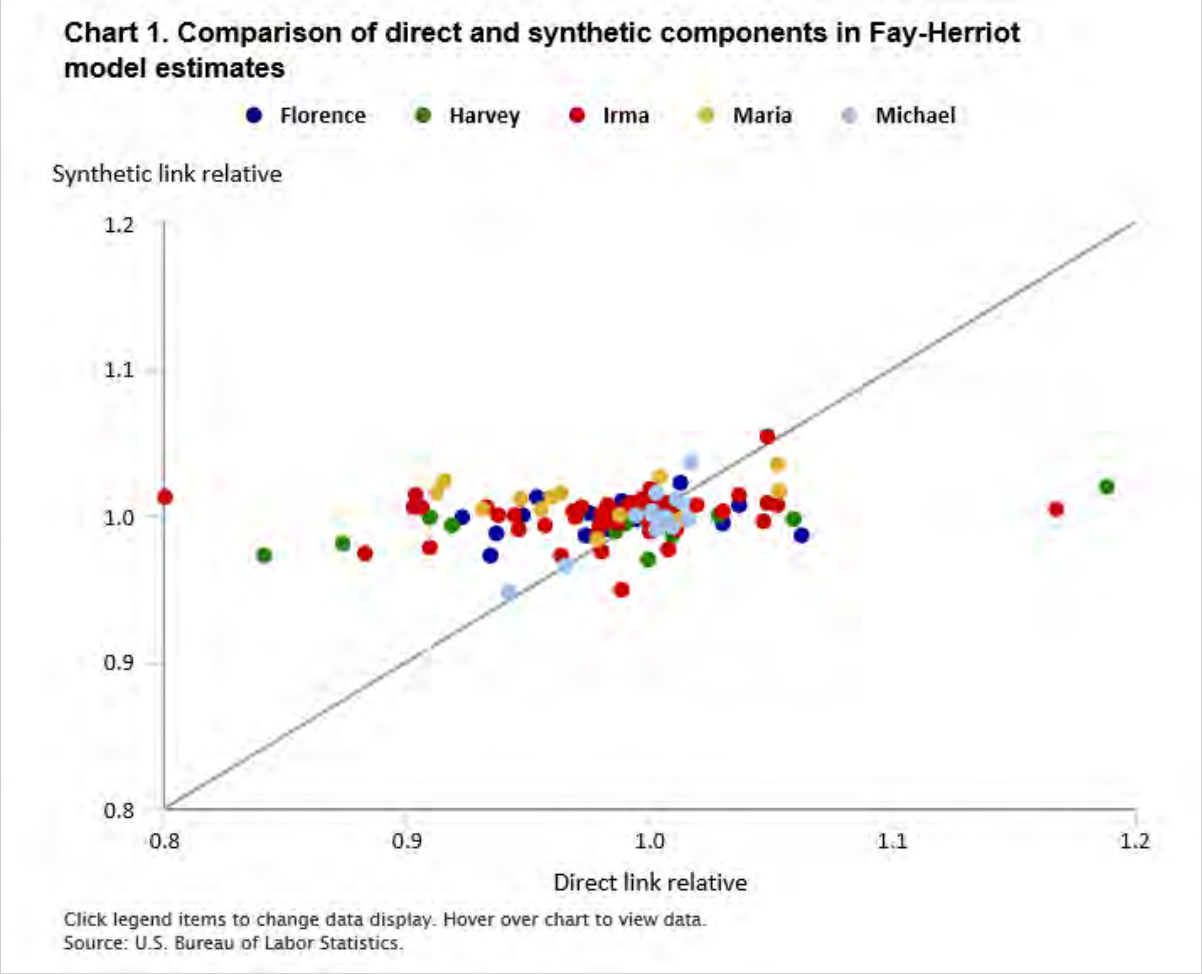
survey and the QCEW resulted in October–December 2017 reestimates that would more closely track the eventual benchmark data released in March 2019.

Nonresponse analysis

Following several major hurricanes, concerns arose over the possibility of businesses in severely affected areas responding at lower rates than those in the rest of the state, which would result in a violation of the missing-at-random assumption. The CES program has investigated nonresponse weight adjustments following hurricanes and other disasters such as floods and wildfires dating back to Katrina, in 2005, in order to appropriately represent disaster areas in statewide estimates. Although these adjustments can be calculated for different levels of devastation—for instance using flood maps—the set of counties designated by the Federal Emergency Management Agency (FEMA) as eligible for individual and public assistance has typically defined disaster areas for purposes of nonresponse analysis. The program now regularly monitors response rates and the impact of differential nonresponse in states affected by natural disasters. However, response rates were not significantly lower in disaster areas following the 2017–18 hurricanes, in part because of dedicated data collection efforts. Applying nonresponse adjustments following the 2017–18 hurricanes would have changed estimates little, with no obvious benefit, and therefore the estimates were not adjusted for differential nonresponse.

Small-area estimation

The CES program widely uses variants of the Fay-Herriot model in producing employment estimates, particularly at the metropolitan-area level.[14] In areas affected by recent major hurricanes, the direct employment estimates were lower than the synthetic components 65 percent of the time. This indicates a breakdown in the assumptions of similarity across states and among areas within each state. Chart 1 shows a comparison of the link relatives for the direct and synthetic parts of Fay-Herriot models in metropolitan areas containing counties designated by FEMA as eligible for individual and public assistance. (Three outlier values are not displayed.) The reference line has a slope of 1, and values above that line indicate a direct estimate lower than the synthetic one.



Although the direct estimates showed the job-losing effects of these hurricanes more, on average, than did the model as a whole, the sample in these domains is small and often quite volatile. Had the CES program used direct estimates instead of Fay-Herriot models, the root-mean-square benchmark revision to the link relatives would have been 37 percent higher.

Experiences following the 2017 and 2018 hurricanes led to the development of other modeling approaches that would generate better results and not violate important assumptions. Instead of modeling all statewide supersectors together and applying the results to metropolitan areas, the domains directly affected by hurricanes could be pooled and modeled together. Had it been used, this “hurricane variant” of the Fay-Herriot model would have produced benchmark revisions that were, on average, 12 percent lower, and it would have improved 64 percent of estimates. The variant model would have improved accuracy the most for the hurricanes with the largest effect on estimates, reducing benchmark revisions for Puerto Rico following Maria by 39 percent and for Florida following Irma by 11 percent. (The hurricane variant improved estimates 71 percent of the time for Puerto Rico and 74 percent of the time for Florida.) The hurricane variant model did not perform well for Texas following Harvey: although the correction factor better captured the drop in employment, worse model fit resulted in a much larger weight on the direct components, which would have resulted in higher benchmark revisions. (See table 3.)

Table 3. Root-mean-square benchmark revision of link relatives for Fay-Herriot modeled series in metropolitan areas during major hurricanes

Hurricane	Direct sample-based	Fay-Herriot	Fay-Herriot hurricane variant	Percentage improved by hurricane variant
All (n = 139)	0.056	0.041	0.036	64.7
Florence (n = 21)	0.031	0.027	0.026	61.9
Harvey (n = 22)	0.060	0.021	0.033	31.8
Irma (n = 68)	0.047	0.036	0.032	73.5
Maria (n = 14)	0.102	0.075	0.046	71.4
Michael (n = 14)	0.058	0.056	0.056	71.4

Applying lessons learned to producing estimates during the COVID-19 pandemic

A historically unprecedented number of jobs were lost and regained in the months after the onset of the COVID-19 pandemic.[15] Health officials identified the first case of COVID-19 in the United States in Washington State on January 21, 2020.[16] However, it would be several weeks before community spread of the virus led to severe business disruptions and shutdowns. Many novel data sources show declining activity throughout the month of March 2020,[17] even before the issuance of formal shelter-in-place and stay-at-home orders.[18] The week of March 8–14 marked a turning point in business activity. Restaurant reservation data from OpenTable illustrate the evolving decline in business activity that week: as of Sunday, March 8, reservations were down only 2 percent over the year, but by the following Saturday (March 14), they showed a 42-percent decline.[19] Ohio was the first state to close all public schools on March 12, and by the end of the following week (March 15–21), nearly all public schools had closed,[20] air passenger travel had fallen by 75 percent,[21] and restaurant reservations had dropped by nearly 100 percent. The National Bureau of Economic Research (NBER) Business Cycle Dating Committee determined that the longest economic expansion in U.S history ended in February 2020 and a recession began in March.[22] Nationwide job losses in March (–1.7 million) and April (–20.7 million) marked the steepest employment decline in history, and were followed by the two largest monthly job gains ever in May (+2.8 million) and June (+4.8 million). The steepness and suddenness of these job losses, followed by a rapid (if partial) recovery, were more reminiscent to the losses seen after major hurricanes than those seen during a typical recession.

The birth–death model

The nationwide increases in the number of establishments reporting zero employment in March 2020 (2.6 times normal) and April 2020 (15 times normal) could only be compared with the spikes following Irma in Florida (2.1 times normal) and Maria in Puerto Rico (6.9 times normal). Evidence from Irma and Maria indicates that using reported zeros could reduce error. Beginning with the March final and April preliminary estimates, the CES state and area program incorporated “excess” reported zeros in the link relative in calculating the employment estimates. In order to avoid statistical bias, the program applied a weight-reduction adjustment value ranging between 0 and 1 to establishments reporting zero employment. In cases in which the proportion of reported zeros

at the state estimation supersector level was at or below normal, the factor was set to 0, and in those cases in which the proportion was many times the usual rate, the factor approached 1. The average weight adjustment factor for a reported zero was 0.603 in March and 0.954 in April. As with Hurricanes Irma and Maria, employment counts also needed to appropriately reflect returns from zero. Weight adjustment factors were also developed for returns, and they were first applied in the May preliminary estimates, as many business reopened. The use of excess reported drops-to and returns-from zero lowered the final sum of state employment estimates by 331,000 in March and 3.0 million in April, while increasing them by 1.0 million in May and 934,000 in June, as many businesses reopened.

In addition, the CES program augmented the time-series forecast component of the net birth–death model with information from the nonzero matched sample as an exogenous regressor in a regression model with autoregressive integrated moving average errors (regARIMA), beginning with the April values.[23] Earlier research indicated that this method could improve forecast accuracy during business cycle turning points, although it was not feasible to implement following hurricanes.[24] The CES program updated the forecast models at the national level and controlled the sum of the state subsector forecasts to the new national forecasts, incorporating sample information on the states and industries seeing spikes in reported zero employment to allocate the distribution of differences. This lowered the sum of state birth–death factors by 799,000 in April compared with what they would have been without the regressor. The models in turn processed more positive sample information in May and June 2020 into higher forecast values.

Nonresponse analysis

The COVID-19 recession led to nonresponse concerns about the state and area employment estimates that were different from but related to those explored after hurricanes. Subdividing states into affected and unaffected regions, as is done for a hurricane, was not a promising option because of the geographic pervasiveness of business disruption. The CES program explored making differential-response-rate adjustments based on business size (the hypothesis being that larger firms may be less disrupted and better able to continue paying employees), but the results were unclear and any adjustments may have exacerbated the effects of confounding factors. The program also explored conducting nonresponse analysis based on linked unemployment insurance filings, but doing so did not uncover notable differences between respondents and nonrespondents.

In producing the April 2020 state-level estimates, a major nonresponse problem appeared as certain detailed industries within the estimation supersectors were broadly underrepresented across states in the responding CES sample in a way that correlated with employment trends. In retail trade, clothing and clothing accessories stores closed almost everywhere in April 2020, and these establishments responded to the survey at relatively low rates, while general merchandise stores and building material and garden equipment stores had comparatively resilient employment and responded at higher rates. Within leisure and hospitality, full-service restaurants lost relatively more jobs and responded to the CES survey at lower rates than limited-service restaurants, while in the “other services” supersector, the laundry and personal care services industry showed steep losses and was underrepresented in the responding sample. This nonresponse issue did not arise in the national estimates because they are produced at a detailed industry level using samples from all states, in contrast to the approach used in the state and local estimates, where estimation supersectors pool samples from heterogeneous industries into a discrete geographic domain.[25]

The CES program took two approaches to nonresponse adjustments for these industries. If it was possible to do so, especially in very large states, the program calculated sample-based estimates at a more detailed level and summed them to replace the estimation supersectors.[26] In states for which this approach was infeasible, the CES program calculated nonresponse adjustments similar to those calculated (but not applied) following hurricanes and those obtained by using preidentified nonresponse factors in the link-relative estimator (d_i). Many of the response-rate differences were longstanding, but they had not substantially affected the estimates. In total, nonresponse adjustments served to lower the sum of April 2020 state employment estimates by 461,000 in leisure and hospitality, 413,000 in retail trade, and 73,000 in other services. As jobs returned, the differential nonresponse problem presented in the opposite direction, and correcting for it increased employment estimates.

Small-area estimation

The CES program explored an approach similar to the hurricane variant of the Fay-Herriot model in March 2020. The program considered a scenario in which certain states and metropolitan areas in the Northeast and Pacific Northwest that had early cases of COVID-19 might have substantially larger employment drops in March, in which case it could have been beneficial to pool those areas together and model them separately. This was not the case, however, as job losses that month presented along a continuum, with no clearly identifiable division, and were only loosely related to early case counts. The ordinary Fay-Herriot models were also problematic. The wide range of job losses among states resulted in very high model variance and subsequently near-total reliance on the direct estimates. Although the direct estimates are approximately unbiased, they tend to have high variability when sample sizes are small, and the poor performance of direct estimates following hurricanes in modeled cells indicated the potential for low accuracy.

Instead, BLS generated and in many cases used a small-area model that generalizes the Fay-Herriot model and relaxes many of its assumptions by jointly modeling variance and point estimates and clustering the data.[27] This model outperformed the existing Fay-Herriot model in simulations, in terms of benchmark revisions, during both the steep downturn of the 2007–09 recession and the subsequent recovery and expansion. When applied during the COVID-19 recession, metropolitan area estimates were more consistent with statewide values and showed a similar story: compared with the Fay-Herriot estimates, the new model reduced the root-mean-square difference between metropolitan and statewide estimates in the same state or industry by 29 percent in the April 2020 preliminary estimates. The combination of lessened reliance on volatile direct estimates (because of better model fit) and state-specific effects being captured in the synthetic component of the clustered model resulted in the tighter relationship among metropolitan area estimates and corresponding state-level estimates.

Conclusion

Timely economic data is needed to capture rapid shifts in business conditions shortly after they occur, and payroll employment estimates from the CES program are among the timeliest economic indicators available each month for states and metropolitan areas. Natural disasters often cause sudden, steep job losses, but the measurement of employment change following disasters presents challenges. The CES survey must accurately capture the relationship between business openings and closings, account for differences between respondents and nonrespondents, and use robust models to accurately estimate employment in small domains. Five major hurricanes that occurred in 2017 and 2018 brought these concerns to light and resulted in the development of potential solutions. Using reported zeros proved beneficial to the estimation process after the survey showed sharp

increases in their number. Modeled estimates could be improved by refining the pool of observations that are processed together.

When the COVID-19 pandemic caused the steepest job losses in U.S. history, the CES program applied the lessons learned from producing estimates following major hurricanes to better capture business deaths, properly represent industries experiencing the most severe declines, and incorporate models that capture important differences between, and commonalities among, states. Using reported zeros proved beneficial following Hurricanes Irma and Maria, and the CES program generalized their use with the wave of business closures that began in March 2020. Although nonresponse was not a major problem after the 2017–18 hurricanes, monitoring processes set up in the wake of those hurricanes helped BLS identify industry-based differential nonresponse adjustments when the steepest job losses in history occurred. Techniques pooling similar observations in Fay-Herriot models showed promise, and the CES program applied a model that more formally clustered the data to produce small-area estimates during the pandemic.

Although job losses during the COVID-19 recession have been far steeper and more sudden than those occurring in typical downturns, the associated measurement challenges highlight areas of potential improvement that could help the CES survey better capture future business-cycle turning points and sudden changes in state and area employment that result from disasters.

ACKNOWLEDGMENTS: Julie Gershunskaya, Greg Erkens, Chris Grieves, and Dan Zhao were essential in solving many of the methodological problems we encountered following recent hurricanes and, in particular, during the COVID-19 pandemic. Paige Schroeder, Brad Rhein, Greg Erkens, and Alba Báez all provided comments that noticeably improved this article. I want to thank them, as well as the CES State and Area program office staff more broadly, who showed a great deal of ingenuity, flexibility, and hard work in producing the estimates.

Steven M. Mance, "Estimating state and local employment in recent disasters—from Hurricane Harvey to the COVID-19 pandemic," Monthly Labor Review, U.S. Bureau of Labor Statistics, April 2021, https://doi.org/10.21916/mlr.2021.9.

NOTES

1 For more information on the design of the U.S. Bureau of Labor Statistics (BLS) Current Employment Statistics (CES) survey and its evolution, see Laura A. Kelter, “One hundred years of Current Employment Statistics—the history of CES sample design,” Monthly Labor Review, August 2016, https://doi.org/10.21916/mlr.2016.35.

2 For more information on the process for benchmarking state and local CES employment data, see Kirk Mueller, “Benchmarking the Current Employment Statistics state and area estimates,” Monthly Labor Review, November 2017, https://doi.org/10.21916/mlr.2017.26.

3 This formula is simplified to remove components that are not relevant to this article. A robust estimation technique is used to identify "atypical" reporters, which are removed from the link and only represent themselves, and reduce the weight on other influential reporters. Employees of religious organizations, which are in scope for CES but not on the sampling frame, are addressed by removing their benchmark level from the prior month's employment before applying the weighted link relative and then added back to the current month's level.

4 Decompositions of benchmark revisions have indicated nonresponse to not be a principal driver of total survey error in the CES survey. See, for example, Larry L. Huff and Julie G. Gershunskaya, "Components of error analysis in the Current Employment Statistics survey," Proceedings of the Survey Research Methods Section, American Statistical Association, October 2009, http://www.asasrms.org/Proceedings/y2009f.html; the paper is also available on the BLS website at https://www.bls.gov/osmr/research-papers/2009/st090050.htm. Although the implicit imputation of the weighted link-relative estimator is generally used, there is some explicit imputation in state and area estimates for large nonrespondents that exhibit a stable, seasonal difference from the rest of the universe using historical QCEW data. These explicit imputations are often not made during disasters.

5 For more information about the CES net birth–death model, see Kirk Mueller, "Impact of business births and deaths in the payroll survey," Monthly Labor Review, May 2006, https://www.bls.gov/opub/mlr/2006/05/art4full.pdf.

6 Fay-Herriot models are commonly used in producing small-area estimates and were introduced by Robert E. Fay III and Roger A. Herriot in "Estimates of income for small places: an application of James-Stein procedures to census data," Journal of the American Statistical Association, vol. 74, no. 366, June 1979, pp. 269–277, https://www.jstor.org/stable/pdf/2286322.pdf.

7 More formally, this involves distributional assumptions linking the direct estimates, historical trend projections, and actual values from a high-level model to more detailed domains. For more detail, see Julie Gershunskaya, "Estimation for detailed publication levels in the Current Employment Statistics survey," Proceedings of the Survey Research Methods Section, American Statistical Association, October 2012, https://www.bls.gov/osmr/research-papers/2012/st120190.htm.

8 Puerto Rico transitioned from a quota-based design to the current probability-based design with the January 2014 estimates. Although the U.S. Virgin Islands were severely affected by Hurricane Maria, employment estimates for the Virgin Islands are not examined in this article because they employ a quota-based sample with an estimation methodology that differs from that of the rest of the CES program.

9 The handling of recent disasters was built upon past experiences, primarily Hurricane Katrina, a thorough examination of which can be found in Molly Barth Garber, Linda Unger, James White, and John Wohlford, "Hurricane Katrina's effects on industry employment and wages," Monthly Labor Review, August 2006, https://www.bls.gov/opub/mlr/2006/08/art3full.pdf.

10 Information on the track and development of these storms and estimates of the damage they caused are from the National Hurricane Center's Tropical Cyclone Reports; for more information, see https://www.nhc.noaa.gov/data/tcr/.

11 Devastation from Hurricanes Irma and Maria was severe enough that officials in the U.S. Virgin Islands were unable to collect establishment data for several months, resulting in a delay in the release of preliminary September, October, and November 2017 estimates for the territory. Unlike the 50 states and the District of Columbia, the workforce agencies in the U.S. Virgin Islands and Puerto Rico collect the majority of the microdata used in their CES estimates. More information is available at https://www.bls.gov/sae/notices/2017/hurricanes-irma-maria-september-october-november-december-2017-payroll-data-for-puerto-rico-and-the-us-virgin-islands.htm.

12 An analysis of credit card data by researchers at the Federal Reserve Board indicated that retail trade spending in the areas affected by Hurricanes Harvey and Irma dropped steeply but returned to normal within 2 weeks of the storms making landfall, which helps explain the comparatively smaller effect of Harvey on CES estimates. See Aditya Aladangady Shifrah, Aron-Dine, Wendy Dunn, Laura Feiveson, Paul Lengermann, and Claudia Sahm, "From transactions data to economic statistics: constructing real-time, high-frequency, geographic measures of consumer spending," Finance and Economics Discussion Series 2019-057 (Board of Governors of the Federal Reserve System, 2019), https://doi.org/10.17016/FEDS.2019.057.

13 Some large business deaths were accounted for in Florida following Hurricane Irma, but they solely represented themselves.

14 Fay-Herriot models are also used in some statewide estimation supersectors, mostly in smaller industries such as mining and logging. Another type of small-domain model is also used by the CES program, primarily in detailed industries.

15 Coronavirus disease 2019 (COVID-19) is caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). For more information, see "COVID-19 science update" (Centers for Disease Control and Prevention, January 15, 2021), https://www.cdc.gov/library/covid19/01152021_covidupdate.html.

16 Lena H. Sun and Lenny Bernstein, “First U.S. case of potentially deadly Chinese coronavirus confirmed in Washington state,” The Washington Post, January 21, 2020, https://www.washingtonpost.com/health/2020/01/21/coronavirus-us-case/.

17 For example, researchers at the Federal Reserve Bank of Minneapolis used smartphone data to create indexes that measure changes in travel and social encounters, which showed broad declines through March and into April 2020. See Victor Couture, Jessie Handbury, Jonathan I. Dingel, Kevin R. Williams, and Allison Green, “Measuring movement and social contact with smartphone data: a real-time application to COVID-19,” Institute Working Paper 35 (Federal Reserve Bank of Minneapolis, Opportunity and Inclusive Growth Institute, July 2020), https://doi.org/10.21034/iwp.35.

18 There is evidence that the formal shutdown orders only explain a small proportion of the decline in business activity. See Austan Goolsbee and Chad Syverson, “Fear, lockdown, and diversion: comparing drivers of pandemic economic decline 2020,” Working Paper 27432 (Cambridge, MA: National Bureau of Economic Research, June 2020), https://doi.org/10.3386/w27432.

19 For more information on restaurant reservation data, see the “State of the Industry” page on the OpenTable website at https://www.opentable.com/state-of-industry.

20 Ohio became the first state to close schools on March 12, and 27 states and territories had done so by March 16. By March 25, all U.S. public schools were closed. See “The coronavirus spring: the historic closing of U.S. schools,” Education Week, July 1, 2020, https://www.edweek.org/ew/section/multimedia/the-coronavirus-spring-the-historic-closing-of.html.

21 Data on passenger throughput during the COVID-19 pandemic from the Transportation Security Administration are available at https://www.tsa.gov/coronavirus/passenger-throughput.

22 The Business Cycle Dating Committee of the National Bureau of Economic Research determined that a peak in economic activity occurred in February 2020, marking the end of the economic expansion that began in June 2009 and the beginning of a recession. For more information, see “Determination of the February 2020 peak in U.S. economic activity” (Cambridge, MA: National Bureau of Economic Research, June 8, 2020), https://www.nber.org/cycles/june2020.html.

23 For more information on regression models with autoregressive integrated moving average (regARIMA), see Kathleen M. McDonald-Johnson and Catherine C. Hood, “Outlier selection for RegARIMA models” (U.S. Census Bureau, 2001), https://www.census.gov/ts/papers/asa2001kmm.pdf.

24 For more information on the regression model used to modify birth–death forecasts, see Victoria Battista, “Back to the future: using current regression variables to forecast forward from historical net birth/death employment,” Proceedings of the Government Statistics Section, American Statistical Association, October 2013, https://www.bls.gov/osmr/research-papers/2013/st130140.htm.

25 See Huff and Gershunskaya, “Components of error analysis in the Current Employment Statistics survey.”

26 In retail trade and other services, the post-stratified estimates were produced at the three-digit NAICS subsector level. In leisure and hospitality, the estimates became the sum of arts, entertainment, and recreation; accommodation; full-service restaurants; and the remainder of food services and drinking places. In some cases, QCEW ratios were applied to the March leisure and hospitality estimates to create a prior-month employment level from which to apply the weighted link relative.

27 For more details on the generalized small-area model, see Julie Gershunskaya and Terrance D. Savitsky, “Bayesian nonparametric joint model for point estimates and variances under biased domain variances,” Proceedings of the Survey Research Methods Section, American Statistical Association, November 2019, https://www.bls.gov/osmr/research-papers/2019/st190020.htm.

PRODUCTIVITY AND COSTS

Second Quarter 2025, Revised

Nonfarm business sector labor productivity increased 3.3 percent in the second quarter of 2025, the U.S. Bureau of Labor Statistics reported today, as output increased 4.4 percent and hours worked increased 1.1 percent. (All quarterly percent changes in this release are seasonally adjusted annualized rates.) From the same quarter a year ago, nonfarm business sector labor productivity increased 1.5 percent in the second quarter of 2025. (See chart 1 and tables A1 and 2.)

Chart 1. Labor productivity, nonfarm business, 2021Q1 – 2025Q2

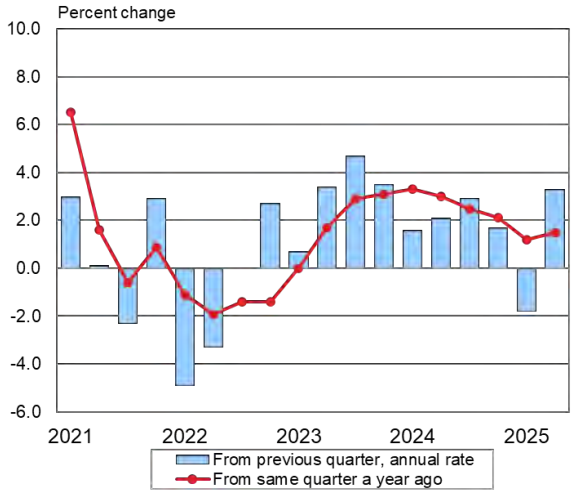

Chart 2. Unit labor costs, nonfarm business, 2021Q1 – 2025Q2

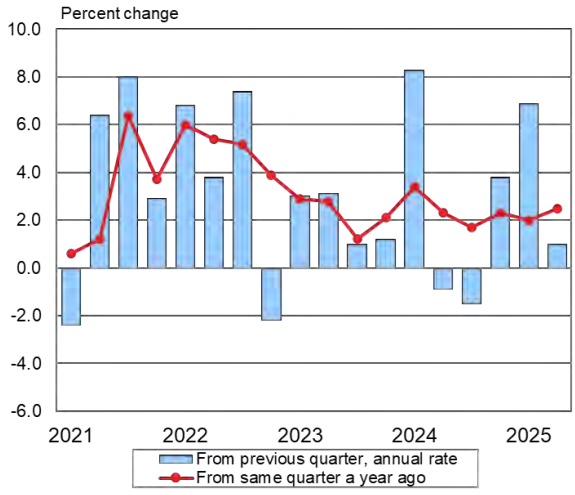


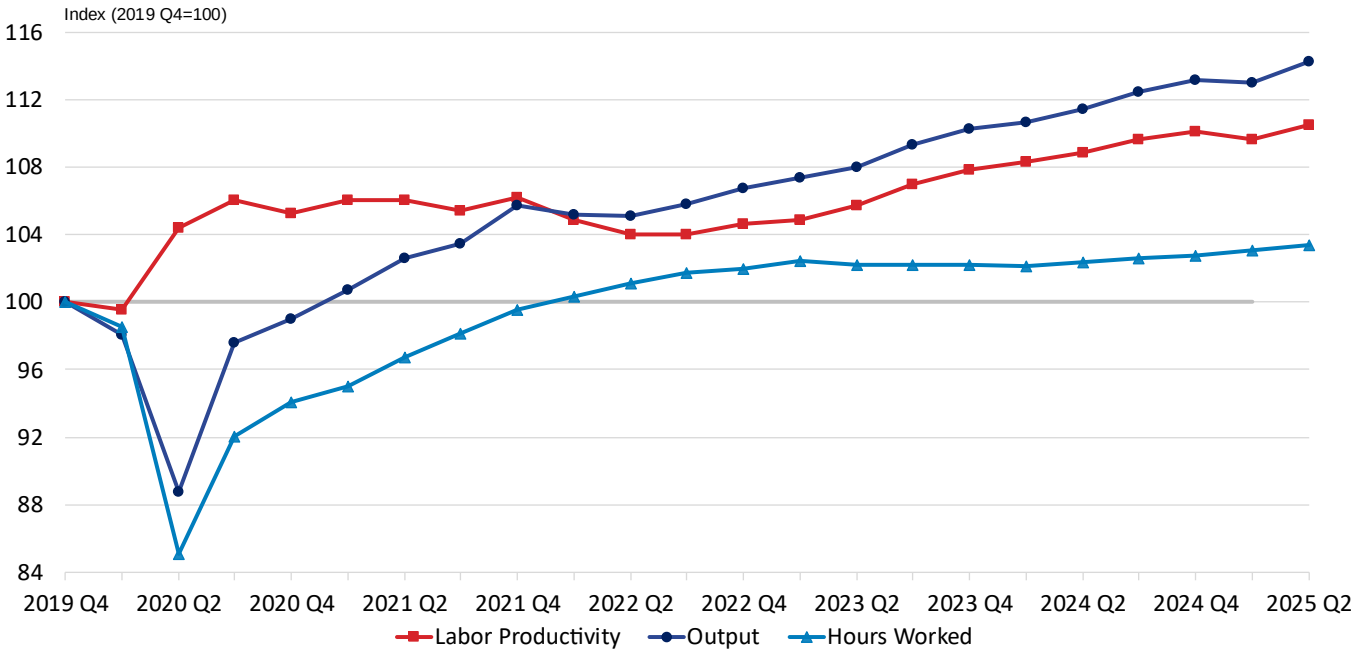
Unit labor costs in the nonfarm business sector increased 1.0 percent in the second quarter of 2025, reflecting a 4.3-percent increase in hourly compensation and a 3.3-percent increase in productivity. Unit labor costs increased 2.5 percent over the last four quarters. (See chart 2 and tables A1 and 2.)

BLS calculates unit labor costs as the ratio of hourly compensation to labor productivity. Increases in hourly compensation tend to increase unit labor costs and increases in productivity tend to reduce them. Real hourly compensation, which takes into account consumer prices, increased 2.6 percent in the second quarter of 2025, and increased 1.5 percent over the last four quarters.

Labor productivity, or output per hour, is calculated by dividing an index of real output by an index of hours worked by all workers, including employees, proprietors, and unpaid family workers. During the current business cycle, starting in the fourth quarter of 2019, labor productivity has grown at an annualized rate of 1.8 percent, reflecting a 2.4-percent rate of growth in output and a 0.6-percent rate of growth in hours worked. (See chart 3.) The 1.8-percent annualized rate of productivity growth in the current business cycle thus far is higher than the 1.5-percent rate of the previous business cycle from the

fourth quarter of 2007 through the fourth quarter of 2019, and is below the long-term rate of 2.1 percent since the first quarter of 1947.

Chart 3. Labor Productivity, Output, and Hours Worked index series, nonfarm business, 2019 Q4 – 2025 Q2

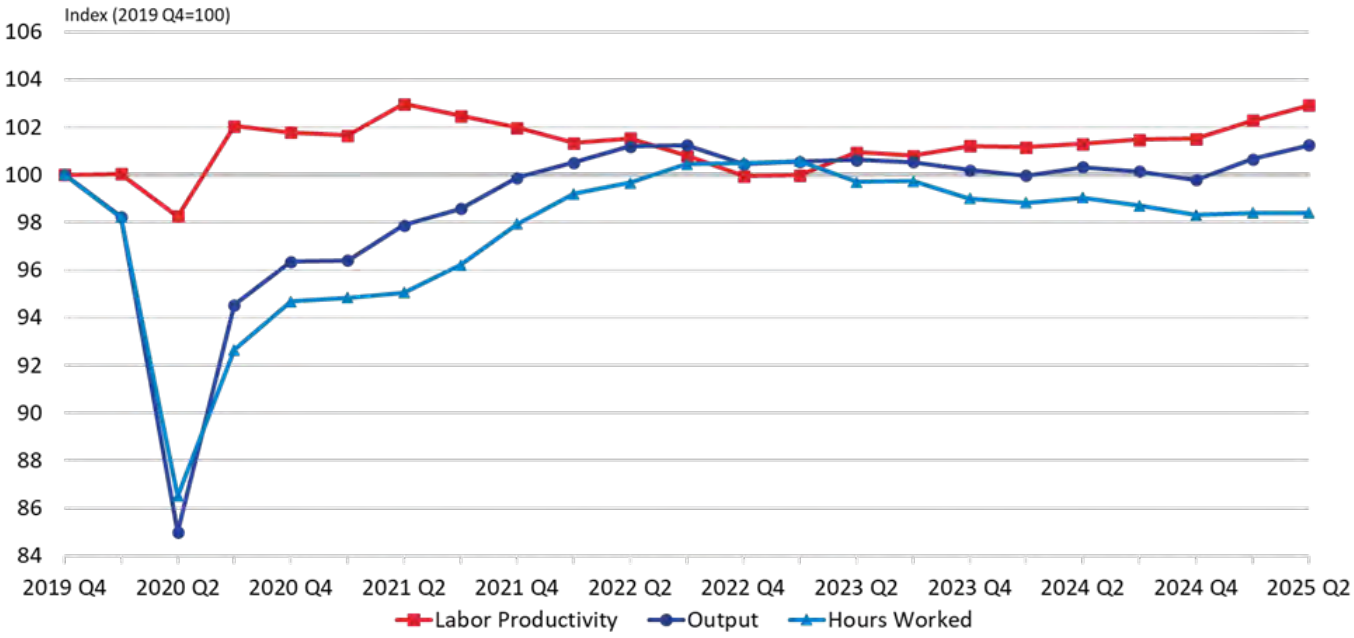


Manufacturing sector labor productivity increased 2.5 percent in the second quarter of 2025, as output increased 2.4 percent and hours worked decreased 0.1 percent. In the durable manufacturing sector, productivity increased 3.2 percent, reflecting a 3.5-percent increase in output and a 0.3-percent increase in hours worked. Nondurable manufacturing sector productivity increased 1.9 percent, as output increased 1.3 percent and hours worked decreased 0.6 percent. Total manufacturing sector productivity increased 1.6 percent from the same quarter a year ago. This is the largest four-quarter gain in manufacturing productivity since the second quarter of 2021, when it increased 4.8 percent. (See tables A1, 3, 4, and 5.)

Unit labor costs in the total manufacturing sector increased 2.0 percent in the second quarter of 2025, reflecting a 4.5-percent increase in hourly compensation and a 2.5-percent increase in productivity. Unit labor costs increased 0.9 percent in the durable goods sector and increased 3.1 percent in nondurable goods industries. Manufacturing unit labor costs increased 2.6 percent from the same quarter a year ago. (See tables A1 and 3.)

Manufacturing sector labor productivity has grown at an annualized rate of 0.5 percent during the current business cycle, as output has increased 0.2 percent and hours have declined 0.3 percent. (See chart 4.) The 0.5-percent annualized rate of productivity growth in the current business cycle thus far is above the 0.1-percent rate of the previous business cycle from the fourth quarter of 2007 through the fourth quarter of 2019 and is below the long-term rate of 2.1 percent since the first quarter of 1987.

Chart 4. Labor Productivity, Output, and Hours Worked index series, manufacturing, 2019 Q4 – 2025 Q2



The concepts, sources, and methods used for the manufacturing output series differ from those used in the business and nonfarm business output series; these output measures are not directly comparable. See the Technical Notes for a more detailed explanation. (See page 7.)

Preliminary measures for the second quarter of 2025 were announced today for the **nonfinancial corporate sector**. Productivity increased 5.7 percent in the second quarter of 2025 as output increased 7.0 percent and hours worked increased 1.2 percent. Productivity increased 3.4 percent over the last four quarters. Unit profits of nonfinancial corporations increased at a 1.9-percent annual rate in the second quarter of 2025 and decreased 1.6 percent over the last four quarters. (See table 6.)

Revised measures

Measures released today are based on more recent source data than were available for the preliminary report; they reflect regular updates of source data from the BLS, the Bureau of Economic Analysis (BEA), and the Board of Governors of the Federal Reserve System. These measures do not reflect labor data to be released September 5, 2025, by the BLS Current Employment Statistics program.

Table B1 presents previous and revised productivity and related measures for the business, nonfarm business, and manufacturing sectors for the second quarter of 2025.

In the second quarter of 2025, nonfarm business sector productivity increased 3.3 percent—a 0.9-percentage point upward revision from the preliminary estimate of a 2.4-percent increase—reflecting a 0.7-percentage point upward revision to output and a 0.2-percentage point downward revision to hours worked. From the same quarter a year ago, nonfarm business sector labor productivity was revised up by 0.2 percentage point, to an increase of 1.5 percent. Unit labor costs increased 1.0 percent in the second quarter of 2025 rather than increasing 1.6 percent as previously reported, reflecting a 0.3-percentage point upward revision to hourly compensation and a 0.9-percentage point upward revision to productivity.

Manufacturing sector productivity for the second quarter of 2025 was revised up to an increase of 2.5 percent from a previously reported increase of 2.1 percent, reflecting a 0.1-percentage point upward revision to output and a 0.4-percentage point downward revision to hours worked. Durable manufacturing sector productivity was revised down 0.1 percentage point to an increase of 3.2 percent; nondurable manufacturing sector productivity had a 0.7-percentage point upward revision to an increase of 1.9 percent. Total manufacturing unit labor costs increased 2.0 percent in the second quarter of 2025, reflecting a 0.3-percentage point upward revision.

Table B2 presents previous and revised productivity and related measures for the business, nonfarm business, manufacturing, and nonfinancial corporate sectors for the first quarter of 2024.

In the first quarter of 2025, nonfarm business sector productivity and unit labor costs were not revised. Manufacturing sector productivity was revised down 0.2 percentage point to an increase of 3.1 percent. As a result, unit labor costs were revised up 0.2 percentage point to an increase of 3.1 percent. In the nonfinancial corporate sector, first-quarter 2025 productivity declined 0.2 percent, as previously reported. Unit labor costs and unit profits in the nonfinancial corporate sector were not revised. (See table 6.)

Quarterly and annual data for all sectors from 2023 forward appear in tables 1-6. Full historical measures can be found on the Productivity and Costs home page: www.bls.gov/productivity/tables/.

The preliminary Productivity and Costs news release for third-quarter 2025 is scheduled to be released on Thursday, November 6, 2025, at 8:30 a.m. (ET).

TECHNICAL NOTES

Labor Hours

Hours worked data for the labor productivity and cost measures include hours worked for all persons working in the sector—wage and salary workers, the self-employed and unpaid family workers. The primary source of hours and employment data is the BLS Current Employment Statistics (CES) program, which provides monthly survey data on the number of jobs held by and hours paid to wage and salary workers in nonfarm establishments, counting a person who is employed by two or more establishments at each place of employment. As of the February 3, 2023 Employment Situation release, the CES program has updated the national nonfarm payroll series to the 2022 North American Industry Classification System (NAICS). The BLS Major Sector Productivity program will be remaining on a NAICS 2017 basis for the time being by converting NAICS 2022 data from CES back to a NAICS 2017 basis using ratios published on the CES website and based on the Quarterly Census of Employment and Wages (QCEW). Hours of paid time off are removed from hours paid using data from the National Compensation Survey (NCS) for 1996 forward and data from the BLS Hours at Work survey, conducted for this purpose, prior to 1990. Between 1990 and 1995, hours of paid time off are removed using a combination of NCS and Hours at Work survey data. Off-the-clock hours are added, yielding hours worked, using data from the Current Population Survey (CPS).

Data from the CPS are used to estimate hours worked for farm labor, nonfarm proprietors, and nonfarm unpaid family workers. Using CPS information on employment and hours worked at primary jobs and all other jobs, separately, the BLS productivity measures assign all hours worked to the appropriate industrial sector. Hours for government enterprises are derived from the CPS, the CES, and the National Income and Product Accounts (NIPA) prepared by the Bureau of Economic Analysis (BEA) of the Department of Commerce.

Detailed hours data are presented in the table “Hours Worked in Total U.S. Economy and Subsectors” on the BLS website (www.bls.gov/productivity/tables/total-economy-hours-employment.xlsx).

Output

Business sector output is a chain-type, current-weighted index constructed after excluding from gross domestic product (GDP) the following outputs: general government, nonprofit institutions, and households (including owner-occupied housing). Corresponding exclusions also are made in labor hours worked. Businesses accounted for about 77 percent of the value of nominal GDP in 2024. Nonfarm businesses, which exclude farming, accounted for about 76 percent of nominal GDP in 2024.

Annual indexes for manufacturing and its durable and nondurable goods components are constructed by deflating current-dollar industry value of production data from the U.S. Bureau of the Census with deflators from the BLS. These deflators are based on data from the BLS Producer Price Index program and other sources. The industry shipments are aggregated using annual weights, and intrasectoral transactions are removed. Quarterly manufacturing output measures are based on the indexes of industrial production prepared monthly by the Board of Governors of the Federal Reserve System, adjusted to be consistent with annual indexes of manufacturing sector output prepared by BLS.

Nonfinancial corporate output is a chain-type, current-weighted index calculated on the basis of the costs incurred and the incomes earned from production. The output measure excludes the following outputs from GDP: general government; nonprofit institutions; households; unincorporated business; and those corporations classified as offices of bank holding companies, offices of other holding companies, or offices in the finance and insurance sector. Nonfinancial corporations accounted for about 51 percent of the value of nominal GDP in 2024.

Labor Productivity

The measure describes the relationship between real output and the labor time involved in its production. Measures of labor productivity growth show the changes from period to period in the amount of goods and services produced per hour worked. They reflect the joint effects of many influences, including changes in technology; capital investment; level of output; utilization of capacity, energy, and materials; the organization of production; managerial skill; and the characteristics and effort of the work force.

Labor Compensation

The measure includes accrued wages and salaries, supplements, employer contributions to employee benefit plans, and taxes. Estimates of labor compensation by major sector, required for measures of hourly compensation and unit labor costs, are based primarily on employee compensation data from the NIPA, prepared by the BEA. The compensation of employees in general government, nonprofit institutions and households are subtracted from compensation of employees in domestic industries to derive employee compensation for the business sector. The labor compensation of proprietors cannot be explicitly identified and must be estimated. This is done by assuming that proprietors have the same hourly compensation as employees in the same sector. The quarterly labor productivity and cost measures do not contain estimates of compensation for unpaid family workers.

Unit Labor Costs

These measures describe the relationship between compensation per hour and labor productivity, or real output per hour, and can be used as an indicator of inflationary pressure on producers. Increases in hourly compensation increase unit labor costs; labor productivity increases offset compensation increases and lower unit labor costs.

Presentation of the data

The quarterly data in this release are presented in three ways: as percent changes from the previous quarter presented at a compound annual rate, as percent changes from the corresponding quarter of the previous year, and as index number series where 2017=100. Annual data are presented both as index number series and percent changes from the previous year.

The index numbers and rates of change reported in the productivity and costs news release are rounded to one decimal place. All percent changes in this release and on the BLS web site are calculated using index numbers to three decimal places. A complete historical series of these index numbers are available at the BLS productivity web site, https://www.bls.gov/productivity/data.htm, or by contacting the BLS Division of Major Sector Productivity (Telephone 202-691-5606 or email productivity@bls.gov).

For a more detailed explanation of methods see the Handbook of Methods at www.bls.gov/opub/hom/msp/home.htm.

r=revised
Source: Bureau of Labor Statistics

SOURCES: Output data are from the Bureau of Economic Analysis and the Census Bureau of the U.S. Department of Commerce; the Bureau of Labor Statistics, U.S. Department of Labor; and the Federal Reserve Board. Hours and compensation data are from the Bureau of Labor Statistics and the Bureau of Economic Analysis.

SIZE OF REVISIONS: Productivity and cost measures are revised on a regular schedule as more complete data become available. The first estimate is published within 40 days of the close of the reference quarter, the second estimate approximately 30 days later, and the third estimate approximately 60 days after the second estimate. Based on past revisions, the third estimate of nonfarm business sector quarterly labor productivity growth has differed from the first estimate by -1.0 to +1.3 percentage point about 80 percent of the time. This interval is based on estimates for reference quarters from the first quarter of 2001 to the first quarter of 2025. For more about revisions to labor productivity growth see "Revisions to BLS quarterly labor productivity estimates: How large are they?" at www.bls.gov/opub/mlr/2022/article/revisions-to-bls-quarterly-labor-productivity-estimates-how-large-are-they.htm.

Table Footnotes

(1) Wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. Except for nonfinancial corporations, where there are no self-employed, data also include an estimate of wages, salaries, and supplemental payments for the self-employed.

(2) The change for recent quarters is based on the Consumer Price Index for all urban consumers (CPI-U). The trend from 1978-2024 is based on the Consumer Price Index Retroactive series (CPI-U-RS).

(3) Unit nonlabor payments include profits, consumption of fixed capital, taxes on production and imports less subsidies, net interest and miscellaneous payments, business current transfer payments, rental income of persons, and the current surplus of government enterprises.

(4) Current dollar output divided by the output index.

(5) Quarterly changes: Percent change compounded at annual rate is calculated using index numbers to three decimal places. Indexes published in the news release are rounded to one decimal place for convenience. Annual changes: Percent change is calculated using annual indexes to three decimal places.

(6) Unit nonlabor costs include consumption of fixed capital, taxes on production and imports less subsidies, net interest and miscellaneous payments, and business current transfer payments.

(7) Total unit costs are the sum of unit labor and nonlabor costs.

(8) Unit profits include corporate profits before tax with inventory valuation and capital consumption adjustment.

Oregon Office of Economic Analysis

Oregon Economic News, Analysis and Outlook

State Productivity and Labor Growth (Graph of the Week)

Posted by: **Josh Lehner** | August 25, 2023

Our office's next forecast is coming out next Wednesday, August 30th. We spent time last forecast talking about how this current cycle is different. Oregon is growing faster due to capital investment and productivity gains, while lagging or at least being in the middle of the pack in terms of population and labor growth. That is not the historical patterns we have seen in the state. We will have more on the potential for better productivity in the years ahead in our upcoming forecast as well. The focus will be on the increase in start-ups, the increase in federal investment, including semiconductors, and the potential of generative AI. But one thing that is getting left on the cutting room floor for the report is this state comparison, which is now the latest edition of the Graph of the Week.

On the horizontal x axis is each state's employment growth from pre-pandemic through this spring. On the vertical y axis is each state's productivity growth from pre-pandemic (2019) the most recently available data from BLS (2022). The color coding of the states reflects simple cluster analysis of which states are closest to each other (distance from the centroid).

Broadly speaking there are 4 clusters. Oregon and Washington are in the top teal colored cluster. These states have seen labor growth around the national average, or below average, but have seen strong productivity gains. In fact, Washington ranks first, and Oregon third for productivity gains so far this cycle. The gray states are right around the national average, more or less. The yellow states lag both in terms of job growth and productivity gains. Clearly there is an impact seen in our resource states (and Hawaii), where the lack of a strong rebound in mining activity during the pandemic even as oil prices went up, weighs on the statewide data. Finally, the blue group on the right has seen strong labor (and population more broadly) gains in recent years. Productivity changes are more of a mixed bag, likely with the oil and gas impacts weighing on Texas. In terms of strong growth for both labor and capital during this cycle, Idaho and Utah stand out as national leaders.

Have a good weekend everybody.

Made in Oregon: A Profile of the State's Manufacturing Sector

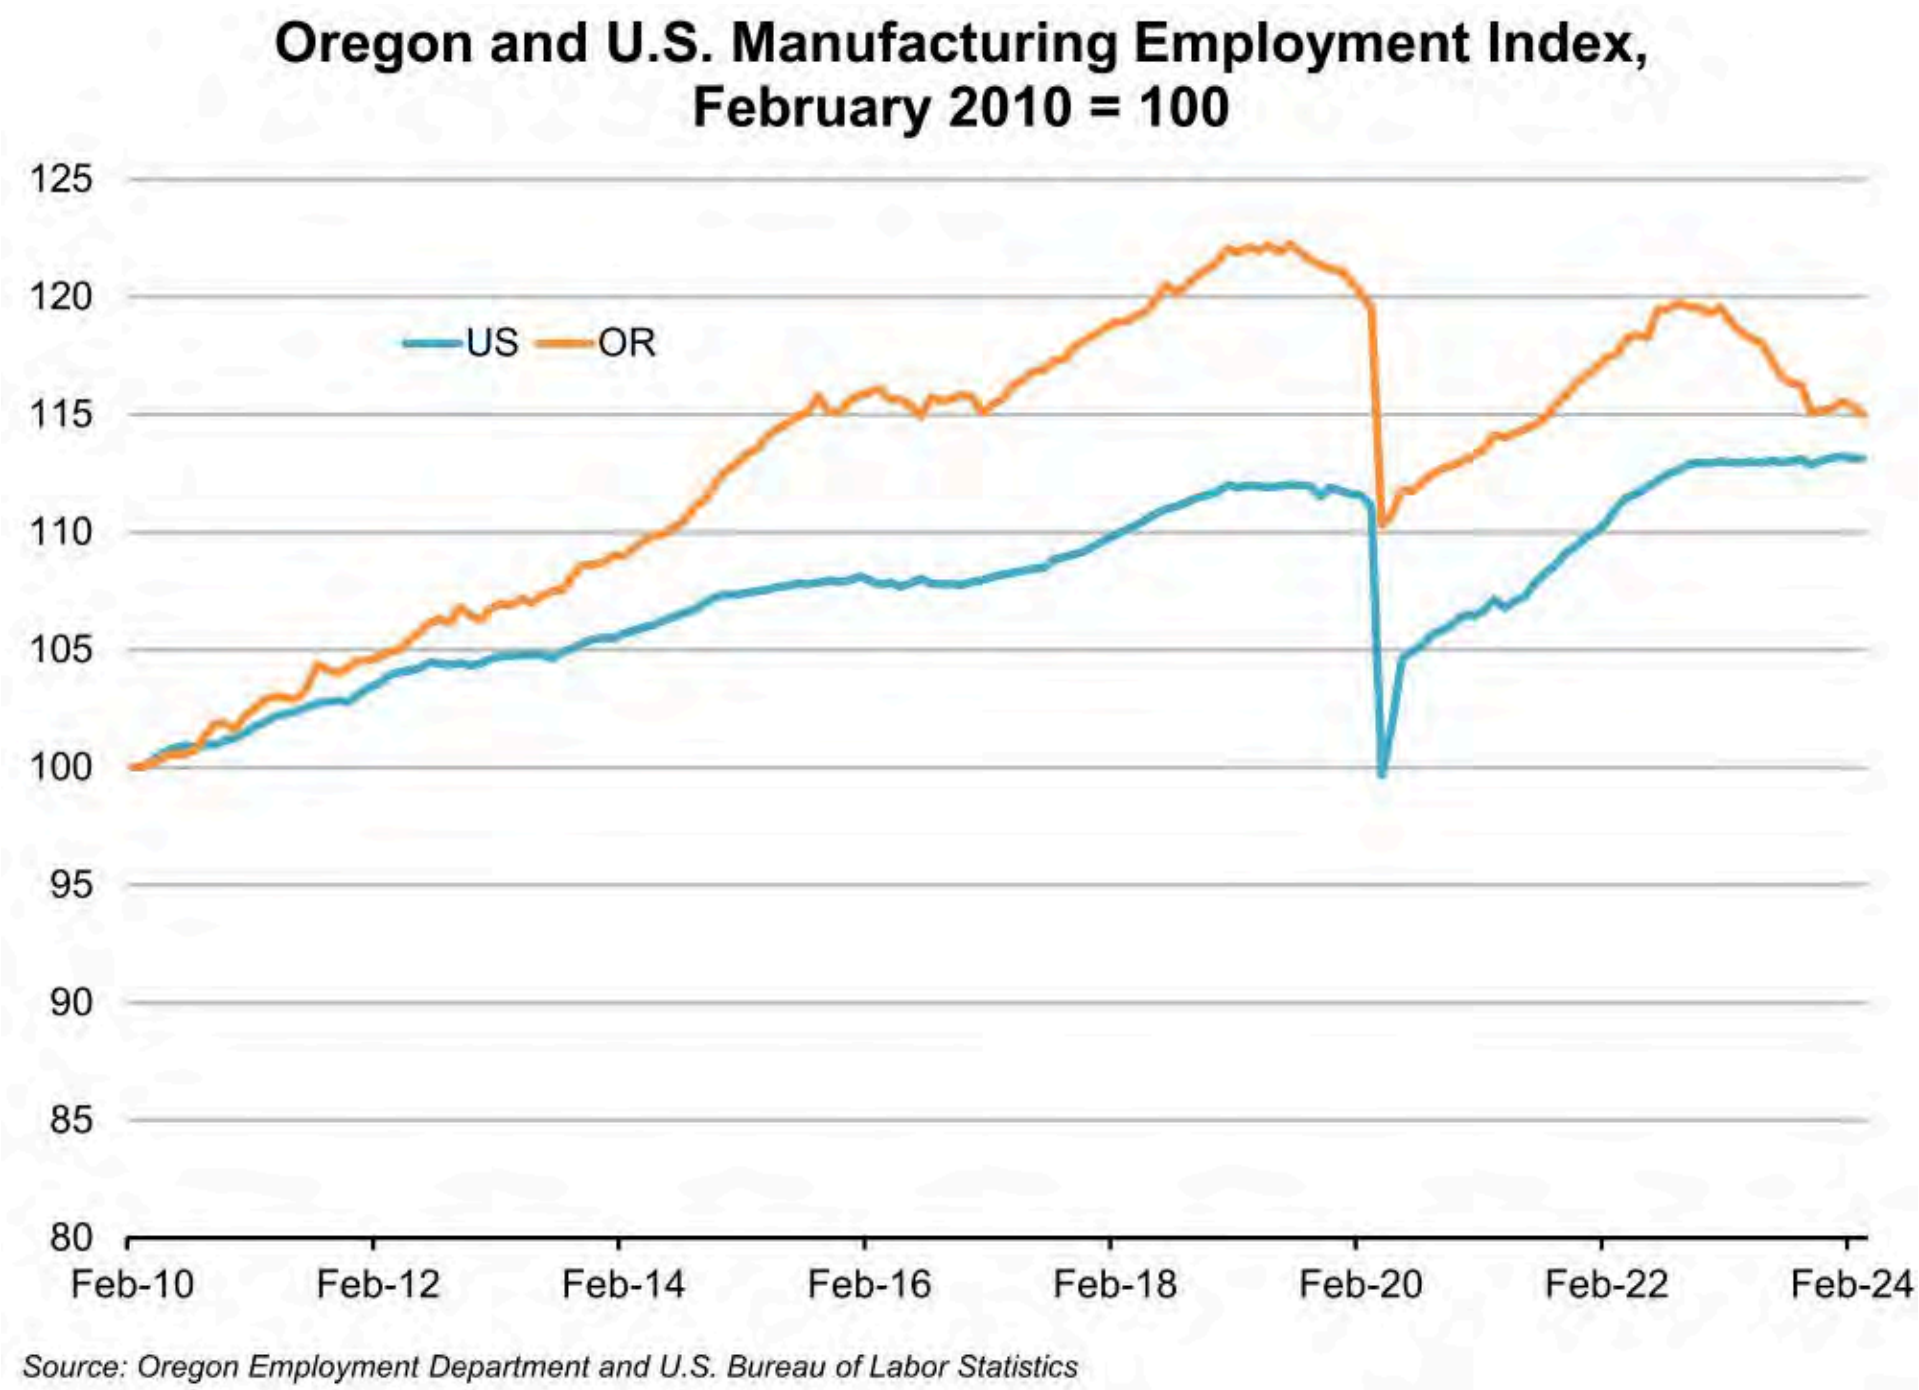
May 03, 2024

by Molly Hendrickson

Oregon-made products have secured a spot on store shelves around the country, and even the world. Some of these products have obvious Oregon roots, tasty things like marionberry jam, cheese, fine wines, and beers that say 'Oregon' right on the label. Some Oregon-made products remain out of view, however. For example, components in the device you're reading this article with might have been made right here in Oregon. Whether you can see it on the label or not, Oregon's manufacturing sector produces products ranging from basic wood pellets to precise aerospace parts. The diverse sector is a fundamental component of the state's identity.

A manufacturing establishment is defined as an establishment that mechanically, physically, or chemically transforms material, substances, or components into new products. In 2022, Oregon was home to 6,786 manufacturing establishments, providing the state with 192,100 jobs or 9.9% of total payroll employment.

Manufacturing has a slightly larger than average footprint in Oregon (9.9% of employment compared with 8.4% nationally) and is growing more quickly over the long term than the nation. Manufacturing, like other industries, was negatively impacted by the pandemic recession. While Oregon had gained back most of the manufacturing jobs lost due to the recession, employment is still below its 2019 peak and declined for much of 2023. Since its lowest employment level in February 2010 (which the United States reached again in April 2020), manufacturing employment in Oregon has grown by 15% compared with the nation's 13%.



Source: Oregon Employment Department and U.S. Bureau of Labor Statistics

Despite outperforming the U.S. in terms of long-term growth, Oregon has recently suffered relatively sharper declines in manufacturing employment since January 2019 that continued during the COVID-19 pandemic. Though there had been substantial recovery through 2022, employment in Oregon's manufacturing sector declined by 6% while U.S. manufacturing has grown by 1% compared with the January 2019 level.

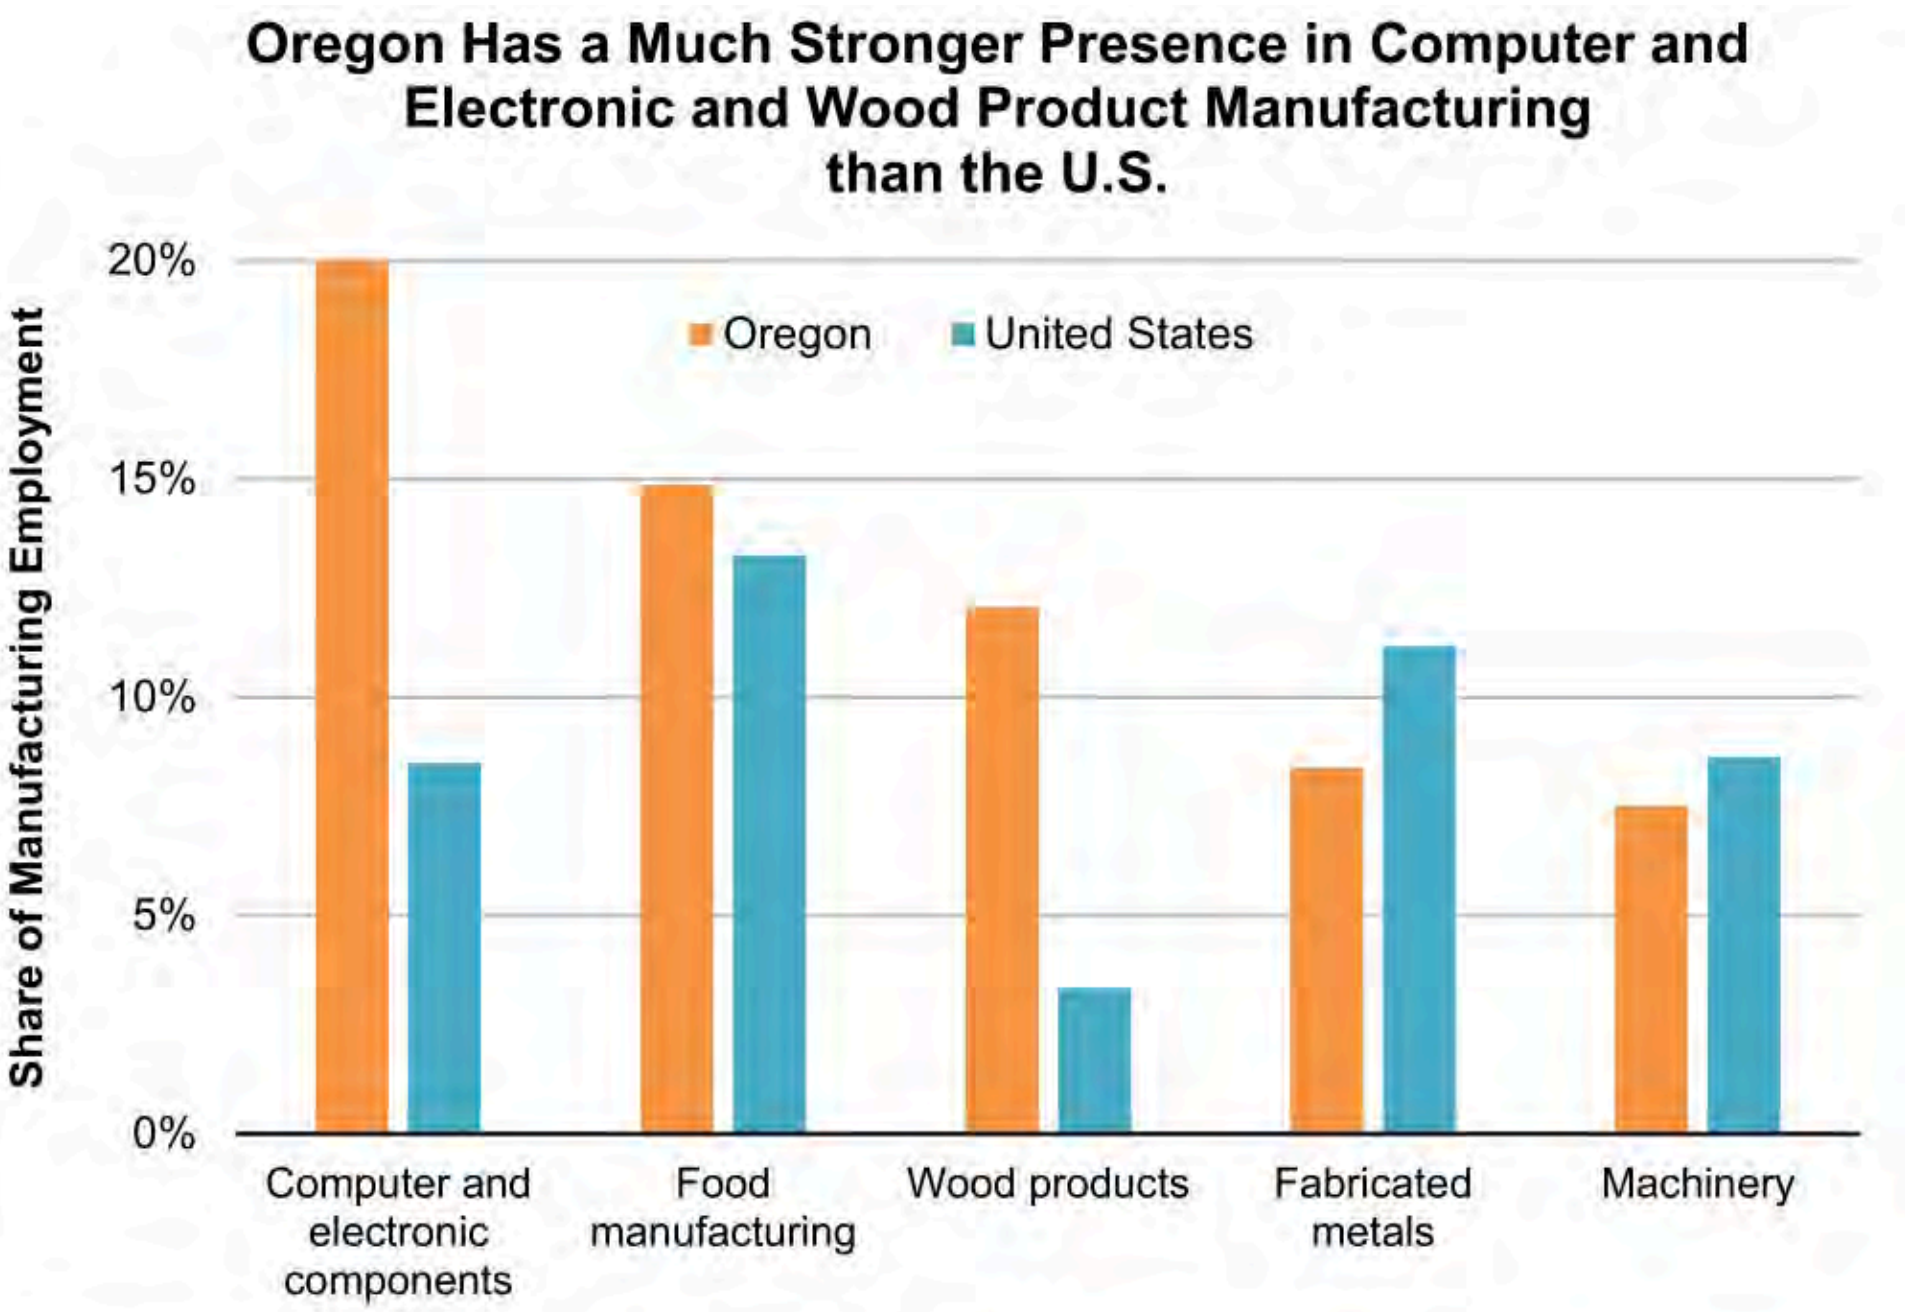
Average wages in Oregon's manufacturing sector have climbed steadily over the past two decades as the state made the shift from a more natural resource-based manufacturing sector to a center for high-tech manufacturing. In 2022, the average annual wage for manufacturing in Oregon was about $83,300. This far exceeded the state's average wage of $66,300.

Looking deeper into Oregon's manufacturing wages, this difference is largely attributable to wages in the computer and

electronic product manufacturing industry, which paid an annual average of about $150,400 in 2022. Excluding computer and electronic product manufacturing, Oregon's average wage across manufacturing industries was about $65,500, slightly below the state's average.

Oregon's Specialties

Oregon's manufacturing sector looks very different than it does nationally. Computer and electronic components manufacturing comprises 21% of the sector statewide compared with about 9% of national manufacturing employment. Wood product manufacturing also has a strong presence in Oregon, making up 12% of sector employment compared with 3% of the sector nationally.



Source: Oregon Employment Department and U.S. Bureau of Labor Statistics

A more detailed industry analysis shows just how diverse the manufacturing sector is. The largest detailed industry by far is the semiconductor and electronic components industry (33,800 jobs in 2022). It also pays far more on average than any other manufacturing industry at $161,600 compared with $83,300 across all manufacturing sectors.

Top Manufacturing Industries in Oregon, 2022

Industry	Employment	Annual Average Wage
Top 10		
Semiconductor and electronic components	33,839	$161,585
Veneer and engineered wood products	8,554	$64,895
Frozen food manufacturing	6,968	$53,386
Sawmills and wood preservation	6,415	$73,802
Industrial machinery manufacturing	6,345	$110,537
Millwork	5,205	$57,469
Navigational, measuring, electromedical, and control instruments	4,797	$103,359
Bread and bakery product manufacturing	4,676	$42,129
Medical equipment and supplies manufacturing	4,338	$65,145
Printing	3,818	$54,979
Other notable industries		
Aerospace product and parts manufacturing	3,050	$90,989
Motor vehicle body and trailer manufacturing	2,991	$52,743
Fruit and vegetable canning, pickling, and drying	2,900	$56,627
Cutlery and handtool manufacturing	2,293	$77,221
Ship and boat building	1,385	$78,886

Source: Oregon Employment Department, QCEW

True to Oregon's long history in forestry, three of Oregon's top industries are tied to our natural resources: veneer and engineered wood products (8,600 jobs), sawmills and wood preservation (6,400 jobs), and millwork (5,200 jobs). While employment in wood product manufacturing is but a fraction of what it was a few decades ago, these three industries combined play an influential role in Oregon's manufacturing sector.

Two relatively low-paying industries in the top 10 largest manufacturing industries are frozen food manufacturing ($53,400), and bread and bakery product manufacturing ($42,100). While these industries make up a large chunk of Oregon's manufacturing sector, the jobs paid average annual wages considerably lower than the statewide average wage of $66,300.

Oregon is well-known across the country for its fresh produce. The number of food preservation businesses, specifically the canning, pickling, and drying of fruits and vegetables, has grown across the state substantially over the years. Employment has risen steadily over the years, and is highly seasonal due to employment spikes around harvest time, though there has been less fluctuation in the past seven years. The annual average wage for fruit and vegetable canning, pickling, and drying is $56,600.

Another notable industry in Oregon is the motor vehicle body and trailer manufacturing industry. This industry includes recreational vehicle manufacturers. Prior to the recession in 2007, this industry peaked at 4,800 jobs. After suffering massive losses during the recession, the industry was left with less than 2,000 jobs. Since then, employment has rebounded and steadily climbed to around 3,000 jobs.

For more information on detailed industries, visit QualityInfo.org where information is published on 125 detailed Oregon manufacturing industries.

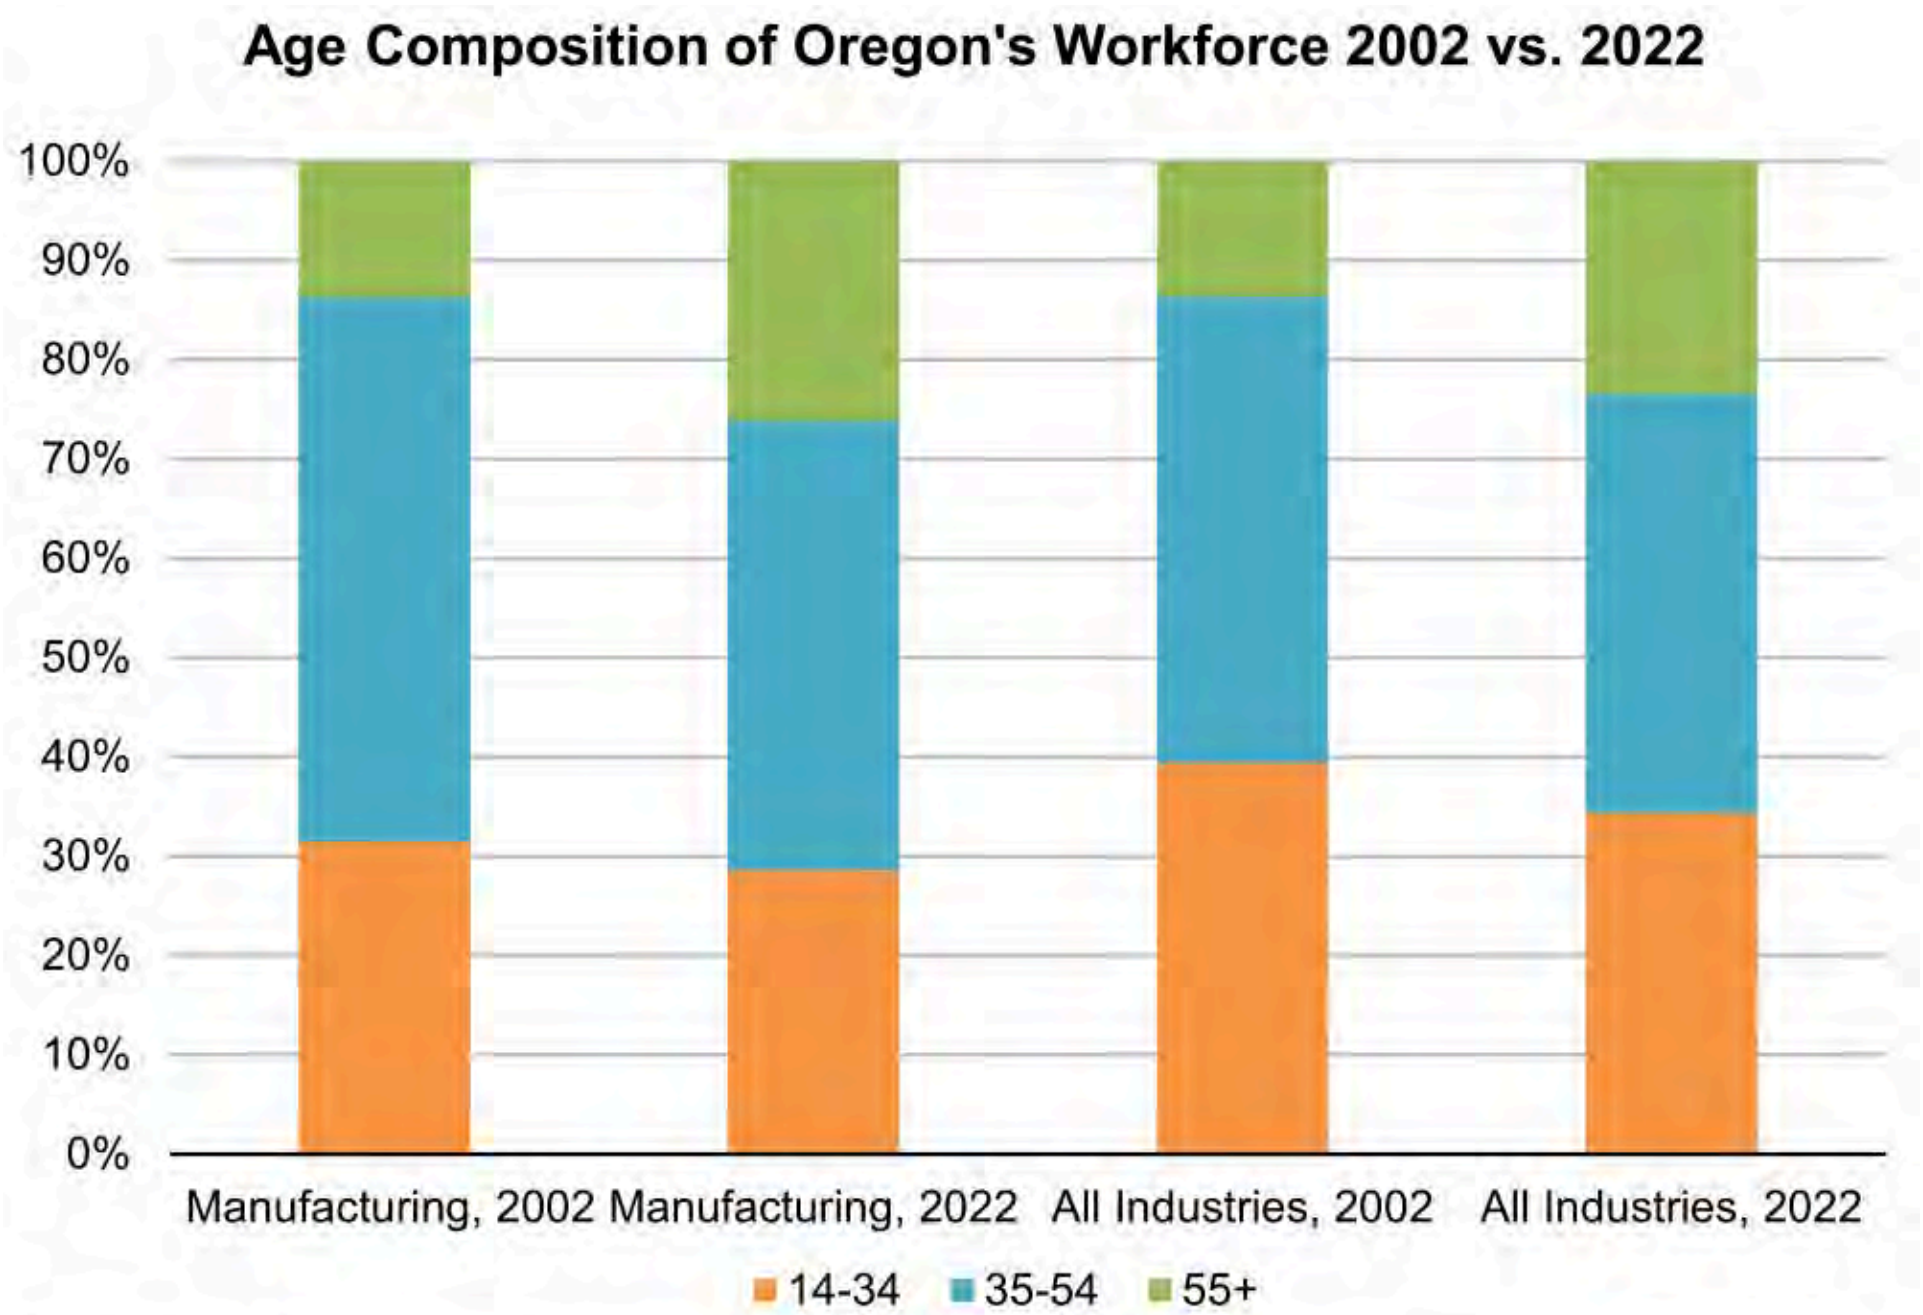
Long-Term Aging of the Mostly Male Workforce

The share of manufacturing workers by gender has remained unchanged for the past 20 years, at about 73% men and 27% women. Overall in 2022, women accounted for 47% of Oregon's private-sector workers; that share also hasn't changed much since 2001, but it is of course more balanced with women's share of the population.

The manufacturing workforce in Oregon is older and aging slightly quicker than the workforce as a whole. Twenty years ago in 2002, 39% of Oregon's workforce was between 14 and 34 years old. In manufacturing, about 32% of workers were between 14 and 34 years of age. In 2022, only 34% of the workforce was between 14 to 34 years old, while in manufacturing just 29% of workers were in this age group.

The share of workers ages 35 to 54 in manufacturing has declined by 10 percentage points compared with 20 years ago. In the overall workforce, this group's share has declined by 5 percentage points over the past 20 years.

In both the overall workforce and the manufacturing workforce, workers in the 55 and over age group continue to make up a larger share now that the youngest baby boomers are turning 60. However, the manufacturing workforce has not had as many young workers enter the industry, as is the case for the overall workforce.



Source: Oregon Employment Department and U.S. Census Bureau, Quarterly Workforce Indicators

As workers retire, these positions will need to be filled by workers who have less experience in the field. This is true for both the overall workforce and the manufacturing workforce but is more pronounced for the manufacturing workforce as fewer young workers have joined.

Projections Show Many Future Openings

The Oregon Employment Department projects that the state's manufacturing sector will grow by 7% between 2022 and 2032. Within manufacturing, primary metals manufacturing is expected to grow quickest at 19%. The only broad manufacturing industry expected to lose employment is paper manufacturing.

Projections for Oregon's Manufacturing Sector, 2022-2032

Industry	2022 Employment	Projected Employment Change	Percent Change
Manufacturing	191,700	14,100	7%
Primary metals	7,200	1,400	19%
Machinery	14,600	2,100	14%
Transportation equipment	10,700	1,300	12%
Fabricated metal products	16,100	1,500	9%
Computer and electronic products	41,000	2,700	7%
Food manufacturing	28,500	1,700	6%
Wood products	23,200	700	3%
Paper and paper products	4,200	-600	-14%

Source: Oregon Employment Department

Manufacturing is expected to grow by 14,100 jobs between 2022 and 2032. In addition to these job gains, there will be many more job openings due to the need to replace workers who leave manufacturing jobs, most of them ending their careers and retiring. Manufacturing may be anticipated to grow at a slower rate than the overall economy in coming years, but as the workforce continues to age there will be lots of job opportunities in the manufacturing industry of the future.

Production occupations with the most projected annual job openings include assemblers and fabricators (1,250); inspectors, testers, sorters, samplers, and weighers (820); packaging and filling machine operators and tenders (810); and first-line supervisors (780). Many high-demand manufacturing occupations typically require a high school education at the entry level. Postsecondary training can make job seekers more competitive for today's manufacturing jobs.

Conclusion

Oregon's manufacturing sector has experienced faster long-term growth than manufacturing across the nation. The state's

manufacturing sector has suffered relatively heavier losses leading up to and during the initial months of the COVID-19 pandemic and has yet to recover all jobs lost. However, 7% growth is projected from 2022 to 2032, and many job opportunities will be available as new jobs are created and workers leaving their current occupations are replaced.

HB 3145

Governor Kotek has signed House Bill 3145, a $25M pilot program to deliver high-quality, energy-efficient homes for families earning up to 80% of Area Median Income (AMI). The bill prioritizes modular, off-site, and mass timber construction; supports Oregon-based builders and sustainable design; focuses on rural, coastal & Eastern Oregon; and expands affordable rental and homeownership options. Originating from a convening with the OMTC and championed by Representative Pam Marsh, this bill helps bring housing to more people, faster and more affordably.

July 2022

Growth trends for selected occupations considered at risk from automation

Breakthroughs in artificial intelligence (AI) and robotics have led to substantial concern that large-scale job losses are imminent. Selected occupations are often cited as illustrations of technological displacement that is or will become a more general problem, but these discussions are often impressionistic. This article compiles a list of specific occupations cited in the automation literature and examines the occupations' employment trends since 1999 and projected employment to 2029. There is little support in U.S. Bureau of Labor Statistics data or projections for the idea of a general acceleration of job loss or a structural break with trends pre-dating the AI revolution with respect to the occupations cited as examples. Offsetting factors and other limitations of the automation thesis are discussed.

Technological change has always attracted attention because of its potential effects on employment. Recent advances in robotics and artificial intelligence (AI) have attracted even more interest than usual, and the breadth and speed of these advances have raised the possibility of widespread job displacement in the near future. Many observers consider these new technologies fundamentally different from previous waves of computing technology. New computing capacities—in areas such as image recognition, robotic manipulation, text processing, natural-language processing, and pattern recognition, and, more generally, the ability to learn and improve rapidly in relatively autonomous ways—represent a break from the hand-coded, rules-based programs of the past. In this view, newer robots and AI represent a clear departure from previous waves of computing, one that accelerates the pace of technological change and job displacement.

Recent writings on automation and employment often refer to certain occupations in passing as examples of jobs that are currently affected by advanced robots and AI or are likely to be affected in the near future. These occupations may be intended as representative examples of general processes or the leading edge of trends that will eventually affect other occupations. Because the occupations are not examined in depth, a natural question is whether the expectations expressed in the automation literature are consistent with U.S. Bureau of Labor Statistics (BLS) projections and recent employment trends for these occupations. There are also potential problems with representativeness in using individual occupations as exemplars. Because part of the workforce is being used as a stand-in for the whole, it is natural to ask whether these particular occupations are actually shrinking rapidly, as well as whether the general practice of citing individual examples has some inherent limitations that are worth bearing in mind.

This article assembles the individual occupations that widely cited recent works on automation consider highly vulnerable to substitution by robots and AI and examines their projected growth from 2019 to 2029. For context, the growth of these occupations over 2008–18 is compared with both the 2019–29 projections and the 2008–18 projections published a decade earlier. Finally, actual and projected growth in these occupations is compared with their growth over 1999–2009. In addition to providing trend data for the past 20 years and projections for the following 10 years, these data permit some consideration of the accuracy of the 2029 projections against the performance of the 2008–18 projections. This article does not examine overall trends by major occupational group, which is covered in a companion paper.[1] Rather, it examines how well recent discussions of automation describe developments in the specific occupations that have been selected to illustrate general trends. The article also examines limitations surrounding any use of occupational examples to understand general employment trends.

Current automation discourse

Since the emergence of information and communications technology (ICT) in the late 1940s, the development of this technology has been uniquely dynamic. Both the power and breadth of applications of ICTs have grown rapidly. Milestones include mainframe computing, early manufacturing automation, minicomputers, microcomputers, the internet, and mobile computing, among others. From their inception, ICTs were understood as a watershed in the development of technology, with great potential for both abundance and displacement. Repeating periodic concerns raised earlier regarding mechanical technology, some observers in the 1950s and 1960s argued computers and industrial automation could lead to massive job losses.[2] Responding to these concerns, congressional hearings, a series of studies by the U.S. Bureau of Labor Statistics, and a multivolume report by a special presidential commission investigated the employment implications of computers and automation.[3] However, when economic growth picked up in the late 1960s and unemployment fell to 3.5 percent, the issue faded into the background.

Concern regarding the impact of computers on jobs reemerged in the late 1980s. Economists became aware of a trend toward greater earnings inequality, which included increasing wage differentials between education groups. The dominant explanation was that new technology increasingly favored more educated workers. This concept of skill-biased technological change (SBTC) pointed to the spread of microcomputers as reducing the demand for less-skilled workers.[4] When wage gaps between the middle and lower percentiles of the wage distribution stopped widening in the late 1990s, attention turned toward the possibility that declining labor demand affected middle-skilled jobs more than low-skilled jobs because their tasks were more codifiable and programmable. It was argued this made middle-skilled jobs more susceptible to automation than low-skill service jobs because service jobs require sensory perception, common sense, and other tacit skills that are difficult to replicate with algorithmic, if–then programming logic.[5]

A new wave of computing has led to further revision regarding the effects of automation. Beginning in 2005 with the successful demonstration of self-driving vehicles, views of the capabilities of ICTs have expanded. A series of often unexpected and dramatic breakthroughs in AI and robotics have expanded the kinds of tasks that information technology can perform. Now robots clean floors, deliver packages, perform warehouse work, check inventory on supermarket shelves, patrol malls, and assist surgery. Other robots lay bricks and sew garments. After 2010, corporate research and development on self-driving vehicles and other AI rose significantly. Breakthroughs in complex game-playing raised the possibility of more general automated intelligence that might replace numerous cognitively complex jobs.[6] By 2015, image recognition, speech recognition, natural-language processing and speech synthesis, machine translation, automated captioning and subtitling, automated text generation, and business analytics made remarkable advances powered by improved hardware, big data, and advances in neural networks and other machine learning techniques. Even experts in the field of AI were often surprised by the rapid rate of improvement and the milestones reached in such a compressed timeframe.[7]

This sudden burst of progress led some researchers and commentators to change their views regarding the kinds of jobs that might be subject to widespread automation in the near future. Complex perceptual and cognitive tasks, like driving vehicles, composing news articles, extracting information from legal documents, and reading radiological images, as well as all kinds of manual and service tasks previously performed by humans, came to be seen as vulnerable to large-scale substitution by machines. Widely cited writings on automation have argued strongly that the new wave of computing technology is fundamentally different from previous waves in terms of its capabilities and speed, and that it may produce massive job displacement in the near future.[8] One widely cited and emulated study claimed 47 percent of U.S. jobs were at risk of automation between 2010 and 2030.[9] This and similar highly publicized claims generated their own congressional hearings and government reports.[10]

One common feature of recent writing on automation is the use of particular occupations as illustrations of the rapid encroachment of robots and AI on jobs previously restricted to human workers. BLS projects 10-year occupational employment trends on a regular basis, so it is natural to ask whether the BLS projections also consider these particular occupations highly vulnerable to automation and whether recent employment trends also suggest reasons for concern. Given the overall size of the U.S. workforce, there are also questions regarding the total number of jobs that are in these potentially vulnerable occupations. If the projections and recent trends suggest these occupations are vulnerable and the occupations are large, either individually or collectively, then recent automation concerns receive support. By contrast, if their growth follows relatively consistent or moderate trends over time or the number of jobs involved is not outsized relative to the overall labor force, then the experience of these occupations would not support current levels of concern regarding automation.

How AI can affect employment

Several considerations are worth noting in investigating this question because they potentially qualify the view that AI and robots will have outsize employment impacts, some of which apply to technological change more generally.

Technological vintage

The current literature on automation considers recent robots and AI much more powerful and consequential for employment than previous ICTs, representing a break with previous computing technology. Therefore, the employment effects of the current wave of computing should be distinguished from the effects of previous waves of computing, such as older automation technologies, conventional office software, the internet, and mobile technology. It is the new functions of leading technologies, their wider applicability, and faster development that has generated especial concern for the future of work. If the new technology simply represents a "handoff" of productivity leadership from maturing ICTs to a new generation of ICTs, without a break or discontinuity in employment trends, then one would not expect to see the current, heightened levels of concern. Therefore, the specific employment effects of newer robots and AI need to be distinguished from the effects of well-established computing technologies, such as digitization, ICT-enabled self-service, ICT-enabled offshoring, e-commerce, and office automation, whose employment effects began earlier and have not necessarily been exhausted. None of these older technologies uses or is dependent on machine learning or advanced robotics. This article focuses on the potential effects of robotics and AI, which have generated the greatest attention and concern recently, but, as will be seen, it is not always easy to maintain the distinction between newer and older computing technologies in practice when examining occupational growth trends.

Scale effects

In addition, the automation literature tends to focus on job destruction due to technological substitution without much consideration of the possibility that innovations could increase demand for a good or service and thus require more workers to meet that demand (a scale effect). The most common scale effect mentioned in discussions of automation generally refers to firm or industry growth resulting from automation-related price decreases and accompanying growth in product demand. It is possible, for example, that partial automation of warehouses may lower retail prices and expand the use of e-commerce so that the total number of warehouse workers might grow even as staffing patterns within each warehouse become leaner. However, if e-commerce demand eventually stops growing and automation continues to progress, employment levels will no longer be buoyed by growth in the size of the product market.

Perhaps more importantly, embedded in the BLS projection models is the understanding that a growing population generally increases total demand for goods and services, which usually increases the total demand for labor, even when productivity is rising.[11] Likewise, a growing labor force provides the means for satisfying growing demand for final goods and services and is typically associated with job growth. The automation literature tends to focus on the jobs that technology eliminates or may eliminate, usually omitting effects of population growth and growth in the total size of the economy, which are reflected in both employment growth and BLS projections.

Task and job variation within occupations

Firms have often responded to the introduction of new labor-saving technology by redefining the tasks involved in existing jobs. Economists often point to the "lump of labor" fallacy in discussing previous waves of technological innovation.[12] According to this view, there is no fixed amount of work to be done in an economy, as an economy not only grows over time but becomes more diversified. Even though machines may reduce the number of jobs in some occupations, historically the workforce has shifted to other, often new occupations. This principle can be extended to the tasks within occupations, as well. Automation of some tasks, such as document review within legal occupations, may result in more time spent on other, perhaps new, tasks without necessarily a reduction in the number of jobs. Although this is certainly not inevitable, observers need to be aware that there is a potential lump of labor fallacy *within* occupations that may inhibit occupational decline, as well as the more familiar application of the concept across occupations. When technology substitutes for some tasks within an occupation, it is possible that workers will be shifted to other, sometimes new, tasks, rather than simply losing their jobs. The extent to which technology augments organizational capacities rather than simply saving labor is an empirical question that tends to be overlooked in discussions of automation, perhaps because it represents continuity rather than a break with existing practices. To the extent jobs are lost, firms may rely on attrition rather than layoffs, which will moderate the pace of occupational decline.

Another issue is that occupational titles in the Standard Occupational Classification (SOC) system may cover a wider range of jobs than may be immediately apparent, and not all of these jobs may be equally susceptible to automation. For example, some estimates of jobs at risk from automation mention the three million jobs in the broad occupation driver/sales workers and truck drivers (SOC 53-3030) as vulnerable to displacement by self-driving trucks, rather than the 1.7 million jobs in the detailed occupation heavy and tractor-trailer truck drivers (SOC 53-3032), some of which, like cement truck drivers, also do not drive long-haul highway routes considered most suitable for autonomous vehicles.[13] Likewise, software may replace accountants who mainly prepare tax filings, but accounting jobs are varied, and those focused on other tasks may remain completely unaffected. Even when jobs within an occupation correspond more closely to assumptions, those jobs may contain more tasks that are difficult to automate than is commonly recognized, which may slow the replacement of human workers by machines.[14] Underestimating the variety of jobs covered by an occupational title and their varying susceptibility to automation is distinct from situations in which the task content of jobs *changes* in response to the introduction of technology. However, in both cases there is a risk of overestimating the importance of a particular technology for a given occupation because of underestimating the variety of their task content, either in the cross-section or over time.

Omitting considerations like scale effects, job redefinition, and job variety, or mentioning them only in passing, assumes by default that the effects of technological substitution are stronger than the effects of economic growth and other offsetting variables that operate to maintain or increase jobs in affected occupations.[15] As will be seen, this is not necessarily a safe assumption. Nevertheless, it should be noted that nothing in this article should be interpreted as minimizing the number of jobs lost, the hardships experienced by workers affected by job loss, or the implications of the changing occupational composition for inequality and economic opportunity more generally.

Data

This article uses data from two BLS sources. Projections data are from the Employment Projections program and historical employment data are from the Occupational Employment and Wage Statistics (OEWS) program.

Employment Projections

BLS conducts research on job trends on an ongoing basis as part of its Employment Projections program. This research is used to make 10-year projections of occupational growth to help members of the public, such as jobseekers, counselors, and education planners, understand labor market trends. As part of the projections process, staff economists conduct detailed research on recent and emerging technologies used in the workplace, as well as prior trends in employment by occupation. This article uses projections files for 2008–18 and 2019–29. These projections cover a 20-year period frequently used as a projection interval in the recent automation literature.[16] The 2019–29 projections permit direct comparison between BLS research and recent work on automation, while avoiding distortions that would arise in the 2020–30 projections because of the effect of the coronavirus disease 2019 (COVID-19) pandemic on employment in 2020.[17] The 2019–29 projections file also includes brief explanations of the technological and other drivers of occupational trends that emerged from BLS research, which are cited at points below.[18]

The 2008–18 projections file contains actual occupational employment for 2008 and both projected and actual occupational employment for 2018. These data provide employment trends for the first decade of the current wave of ICTs and a benchmark for evaluating how well the projections methodology anticipated trends in occupational employment. Although there is no way to evaluate the projections for 2029, the performance of the 2008–18 projections provide a useful point of comparison when considering the likely performance of the 2019–29 projections.

Using the performance of the 2008–18 projections to provide perspective on the likely performance of the projections to 2029 is complicated by several factors. Projections aim to provide a general guide to the course of future occupational employment but recognize there will likely be some divergence between projected and actual figures in the target year, given previous experience and the intrinsic uncertainties involved. Therefore, modest differences between projected and actual values for 2018 should not be given great weight. However, the implications of any large divergences for projections to 2029 may be ambiguous because the later projection may take the earlier discrepancies into account and try to address the problems that caused them. Nevertheless, Carl Benedikt Frey and Michael Osborne argue the BLS projections lag technological developments, so it is important to note cases in which the projections underestimated change during the first decade of the AI era and continue to project gradual change in the next decade.[19]

Occupational Employment and Wage Statistics

Because some occupations identified as vulnerable to substitution by robotics and AI may have been affected by previous waves of computing technology, and may continue to experience these effects, this article also examines growth trends for the 1999–2009 period by using the Occupational Employment and Wage Statistics (OEWS) database. The OEWS database covers a somewhat narrower range of industries than the projections data. This difference will produce some discrepancies in the absolute levels of employment between the OEWS and projections files. However, the growth rates for 1999 to 2009 should be a useful benchmark for judging whether subsequent changes in occupational employment represent a qualitative break with prior rates of change, as suggested by recent work on automation. A discussion of occupational growth rates (in the next section) also uses the OEWS database for 1999 to 2018 to show typical rates of occupational growth and decline to provide context. Readers should bear in mind that two different data series, Employment Projections and OEWS database, are used to derive the main results for occupations considered highly susceptible to automation because the data series cover different years, which produces some noncomparabilities noted below.[20]

Both the projections and the OEWS database use the Standard Occupational Classification (SOC) system, which is a hierarchical system for coding occupations. For example, the 2000 SOC has 821 detailed occupations, which are nested within approximately 450 broad occupations, 96 minor occupation groups, and 23 major occupation groups. The writings consulted for this article generally use the equivalent of detailed occupations when discussing jobs at risk of automation, but those writings sometimes use the equivalent of broad or even minor occupations, which is reflected in the tables that follow. The relationship between automation and major occupation groups is covered in a companion paper.[21] The SOC system was revised significantly beginning in 2010 and, again, beginning with data collected in 2019, which can introduce some comparability issues across periods.

Occupational size and growth: general considerations

Because discussion of automation often uses particular occupations to illustrate general employment trends, it is useful to have some perspective on the varying sizes of occupations. BLS projections data report 163 million jobs in the United States in 2019, which are classified into 790 detailed occupations. Therefore, the average occupation had 206,072 jobs and accounted for about one-tenth of 1 percent (0.13 percent) of all jobs. However, the highly skewed nature of the distribution means that the share of the largest occupation accounted for more than 20 times the average (2.7 percent). Occupational size declines fairly rapidly thereafter, such that the share of the smallest occupation in the top decile of the occupational employment distribution accounted for about twice the average (0.29 percent). The median occupation had only about 54,000 jobs, accounting for just 0.03 percent of all jobs, and the nearly 400

occupations below the median each accounted for 0.01 percent of all jobs on average. Clearly, occupational size is an important consideration when focusing on particular cases given that most occupations are small in absolute terms and even large occupations account for relatively small shares of all jobs. (For further information on the occupational size distribution, see the appendix). Even very large percent declines imply limited overall job losses in the case of most occupations, and very large percent declines in occupational employment are themselves not very common.

Between 1999 and 2018, the total number of jobs grew 17 percent for the 669 occupations in the OEWS database that can be followed consistently. This represents average 10-year and 20-year growth rates of 8.6 percent and 18.0 percent, respectively. Given the general increase in jobs, which partly reflects growth in the population and labor force, one would expect most occupation-specific growth rates to be positive. However, while many occupations experienced below-average growth, others experienced absolute declines. An occupation must decline by 25 percent per decade to shrink by 44 percent over two decades, equivalent to 0.56 of its base-year level. This is comparable to the rate of change implied by Frey and Osborne's widely cited forecast of a 47-percent decline in the total number of jobs over 20 years.[22]

Such steep declines are unusual. Table 1 shows the actual distribution of growth rates in the OEWS database for 1999–2018. The top data row shows that only about 15 percent of occupations (column 1), accounting for 9 percent of jobs in 1999 (column 2), declined by 25 percent or more per decade over the full period. Clearly, current views of automation imply a sharp break with the recent past in terms of the scale of occupational employment decline. Table 1 also shows that about half of all jobs in 1999 were in occupations that grew or shrank by up to 10 percent per decade over the next 19 years (row 2), two-thirds were in occupations that changed within 20 percent per decade (row 3), and 83 percent of jobs were in occupations that changed within 30 percent per decade (row 4).

A more detailed breakdown in panel B of table 1 shows that, as one moves away from the central, slowest growth category (0- to 10-percent growth) and toward categories representing larger shifts, the shares of occupations and jobs involved grow smaller. This is especially the case for declining occupations. Only 21 occupations, representing 1 percent of jobs in 1999, declined by 50 percent or more per decade from 1999 to 2018. By contrast, 55 occupations, representing 2.7 percent of jobs in 1999, grew by 50 percent or more per decade over the same period.

Table 1. Distribution of occupations' 10-year growth rates, 1999–2018

10-year growth	Percent of all occupations	Percent of all jobs	Number of occupations	Percent of jobs, small occupations (*N* = 338)	Percent of jobs, large occupations (*N* = 104)
A. Select growth rates					
Declined by 25 percent or more	15.1	9.0	101	13.1	4.9
Changed ± 10 percent	30.9	51.2	207	23.8	59.9
Changed ± 20 percent	51.7	67.8	345	44.7	74.5
Changed ± 30 percent	69.3	83.0	463	64.8	87.5
B. All growth rates					
$G \leq 0.5$	3.1	1.0	21	4.00	0.3
$0.5 < G \leq 0.7$	8.7	6.3	58	11.30	5.5
$0.7 < G \leq 0.8$	7.3	4.7	49	9.70	3.3
$0.8 < G \leq 0.9$	9.3	5.3	62	9.80	2.7
$0.9 < G < 1.0$	13.8	16.0	92	11.60	16.9
$1.0 \leq G \leq 1.1$	17.2	35.2	115	12.20	43
$1.1 < G \leq 1.2$	11.4	11.3	76	11.10	11.9
$1.2 < G \leq 1.3$	10.3	10.5	69	10.40	9.7
$1.3 < G < 1.5$	10.8	7.1	72	11.30	5.2
$1.5 \leq G$	8.2	2.7	55	8.70	1.4
Total [1]	**100.1**	**100.1**	**669**	**100.1**	**99.9**

Note:
[1] Totals do not sum to 100 because of rounding.
G = growth rate, and *N* = number of observations. Small occupations are defined as those with fewer than 50,000 jobs, and large occupations are defined as those with greater than 250,000 jobs.
Source: U.S. Bureau of Labor Statistics, Occupational Employment Statistics 1999–2018.

It would not be surprising to find that rates of change were larger for smaller occupations, because absolute changes imply larger percent changes. This is confirmed by comparing the employment-weighted distribution of occupational growth rates for occupations with less than 50,000 jobs in 1999 (see table 1, column 4) with the distribution for occupations with more than 250,000 jobs in 1999 (column 5), which together account for two-thirds of all occupations included in the table (442 of 669). The differences are even more apparent when the two distributions are compared graphically **(**see chart 1**)**. In sum, very large declines in occupational employment were relatively uncommon between 1999 and 2018, and they tended to be concentrated among smaller occupations, limiting their effect on overall employment. The pattern of occupational decline implied by automation futurists would represent a dramatic departure from recent trends.

Occupations considered highly susceptible to automation

Tables 2 and 3 show recent and projected trends for 27 occupations that have been used as illustrations in widely cited works on the effects of robotics and AI on employment.[23] Most of the discussion will focus on the percent growth figures in the percent change columns of table 3, but the absolute number of jobs in table 2 and the changes in absolute levels in the absolute change columns of table 3 are relevant to the question of magnitudes and provided for reference. In both tables, occupations in the top panel are closer to "pure" cases in which technological drivers of employment are more likely to be exclusively robotics and AI. Occupations cited in the automation literature that appear in the bottom panel are more mixed and are likely to have been affected significantly by previous waves of computing technologies, in addition to any effects of more advanced information and communications technologies (ICTs). Nevertheless, the distinction is not clear, if only because the magnitudes of the various technological effects on different occupations are not well understood. All figures for 1999 to 2009 are derived from the OEWS database, while figures for 2008 to 2018 and 2019 to 2029 are derived from the Employment Projections database, which adds the self-employed and certain other groups to the OEWS totals.

Table 2. Job trends for detailed occupations considered high risk for automation, 1999–2029 (number of jobs in thousands)

SOC code	Title	OEWS		BLS projections database

2 Broad occupation.
SOC = Standard Occupational Classification system, OEWS = Occupational Employment and Wage Statistics, BLS = Bureau of Labor Statistics, and p = projected value. All occupation codes are from SOC 2010, but the SOC 2000 codes used for the 1999–2009 OEWS and the 2008–18 BLS projections and the SOC 2018 codes used for 2019–29 may differ. Public relations specialists (SOC 27-3031) cannot be identified uniquely in the projections database prior to 2019.
Source: U.S. Bureau of Labor Statistics, OEWS database 1999–2009 and BLS occupational projections files for 2008–18 and 2019–29.

At the most basic level, concerns regarding automation are supported if occupations in panel A of table 3 are projected to decline sharply in the 2019–29 period and, secondarily, if they also shrank in the 2008–18 period with the birth of the modern AI industry. Nevertheless, with continued population and labor force growth, one might also focus on occupations whose growth was far below average for a given period.

The AI literatures leads one to expect faster rates of employment decline for the 2019–29 period compared with previous periods. In table2, one would also expect rates of decline in panel A to be faster after 2008 than rates of decline for occupations in panel B for 1999 to 2009, when those occupations were affected only by prior waves of computing technology. Finally, if occupations in panel B are affected by both prior and new waves of computing technology after 2008, their rates of decline would be expected to be the most rapid of any group or period in table 3. Unfortunately, these kinds of comparisons across panels are complicated by the fact that job growth has been decelerating because of the decline in the growth of the working-age population over time, which exerts an independent drag on the growth of jobs overall.[24] For example, the total number of jobs grew 10.5 percent from 1999 to 2009 and then slowed to 6.5 percent from 2008 to 2018 according to the OEWS database, while the projections anticipate further deceleration to 3.7-percent growth from 2019 to 2029. Under these circumstances, one would expect slower job creation in more recent years regardless of technological advances.

Aggregate results

Panel A of table 2 shows occupations used in the literature as examples of occupations susceptible to job loss from AI and robots and classified here as unaffected by earlier ICTs. The number of jobs in this group rose from 13.3 million (2008) to 15.1 million (2019) and is projected to grow further, to nearly

16.0 million (2029). This group's share of all jobs rose from 8.8 to 9.3 percent (2008–19) and is projected to rise more slowly to 9.5 percent by 2029. In other words, these occupations grew in both absolute and relative terms since 2008 and are expected to continue to do so. According to the OEWS database, these occupations also grew in absolute size from 1999 to 2009, but their relative share remained flat at 8.8 percent of jobs during this period. Table 3 shows this group grew somewhat faster than projected from 2008 to 2018 (13.9 percent real growth versus 8.7 percent expected growth) and is projected to continue to grow faster than average for 2019 to 2029. Therefore, neither recent data nor BLS projections suggest automation is a serious issue for this group overall, though individual occupations may face greater risks.

Occupations in panel B of table 2, potentially affected by both current and previous waves of computing, account for somewhat more jobs. Jobs in this group grew from 17.9 million (2008) to 18.4 million (2019) but are projected to fall to 18.1 million by 2029. This group's share of all jobs fell from 11.8 percent (2008) to 11.3 percent (2019) and is projected to fall by a similar amount to 10.7 percent by 2029. It is worth noting that the 2008–18 projections anticipated these occupations would account for 11.5 percent of jobs in 2018, and their actual share was very close, 11.4 percent in 2018. These occupations grew more slowly than average over both the 1999–2009 and 2008–18 periods. (See table 3.) The projections anticipate their growth will turn negative for 2019 to 2029, declining by 1.8 percent. For this group, negative forces are expected to dominate offsetting forces like general growth in the population, labor force, and economy. However, the magnitude of the decline is expected to be much less than anticipated in the automation literature, even though growth in these occupations may be affected by both preexisting and newer varieties of computing technologies.

Panel C of table 2 shows jobs in the two groups of occupations, taken together, grew from 31.2 million (2008) to 33.5 million (2019) and are projected to grow to 34.1 million (2029). Their share of all jobs remained essentially flat at 20.7 percent for 2008 and 2019, and the share is projected to decline by 0.4 percentage points by 2029. The similarity between their projected and actual share of jobs in 2018 (20.2 percent versus 20.8 percent) increases one's confidence in the general magnitudes of the projections for 2029 at the aggregate level. The bottom row of table 3 shows the combined group grew 7.5 percent over 2008–18, nearly identical to the projected rate (7.8 percent). This rate is comparable to the 8.5 percent recorded in the OEWS database for the 1999–2009 period and more rapid than the 1.6 percent projected for 2029, which would be somewhat below average relative to projected job growth overall. The next two sections discuss the 27 occupations in these two groups in more detail.

Detailed occupations newly affected by robotics and AI

Reading four key works on automation, one finds 11 occupations used as illustrations whose employment levels were likely to be relatively unaffected by previous waves of computing.[25] Therefore, one can have somewhat greater confidence that recent or projected employment declines for these occupations reflect newer technology, like robotics and AI, exclusively. In contrast to these "pure cases," the next section ("Occupations also affected by previous waves of computing technology") discusses occupations cited by the recent automation literature whose employment levels have likely been affected by prior waves of computing, as well as any effects of robots and AI. For none of the occupations in this section do the employment projections to 2029 or observed changes for the 2008–18 period fit the pattern of large-scale job loss suggested by the automation literature. The only occupation with actual or projected employment declines after 2008 is surgeons. The trend for this occupation–and for others growing at a below-average rate since 2008–is evident in the 1999–2009 period, as well, predating the AI breakthroughs of the early 2010s and therefore likely reflecting other forces (see table 3).

Personal financial advisors

Recent works on automation note that algorithms can provide personalized financial advice.[26] Indeed, BLS projections for 2029 anticipate greater use of "robo-advisors," which have existed since the early 2000s.[27] However, the projections anticipate that the demand for personal financial advisors will continue to increase, more than offsetting the anticipated labor-saving effects of AI-driven advising systems. Indeed, AI may be widening the market by reducing cost of personal financial advice for people who may have been unable to afford human advisors. In this case, AI will augment rather than replace labor, as human workers would not have been hired to serve these clients in the absence of AI.[28] The projected 10-year growth will remain slightly above average (4.4 percent) but will not be close to the rapid 30-percent growth in both projections and reality for the 2008–18 period and the 87-percent growth recorded in the OEWS database for 1999 to 2009. Part of the growth in prior years reflected increases in the population engaging in retirement planning. Further research would be required to understand whether robo-advisors and other information technology account for a significant portion of the slowdown in growth since 2009.[29]

Interpreters and translators

The development of machine translation is one of the most remarkable achievements of AI in the past 20 years. Combined with speech recognition and speech generation capabilities, translation software may substitute for human translators of both written text and real-time conversations and presentations.[30] Nevertheless, projections to 2029 anticipate a 20-percent increase in jobs within this occupation as many businesses increasingly need translation services because of globalization. This would still represent deceleration compared with the 49.4-percent growth from 2008 to 2018, which itself was underestimated in the projections (22.2 percent), and the tripling recorded by the OEWS database in this small occupation from 1999 to 2009.

Surgeons, except ophthalmologists

Surgical robots have received significant attention.[31] Although some discuss them in the same context as industrial robots, suggesting they will substitute for nonroutine manual tasks performed by humans , others concede they are more likely to augment rather than replace human surgeons.[32] A recent systematic review did not find clear advantages of robotic over conventional surgery despite greater cost and length of operations, though the technology may improve in the future.[33] BLS projects the number of surgeon jobs will decline by 2 percent between 2019 and 2029, a significant moderation compared with the 30-percent decline from 2008 to 2018, which was probably not due to robot adoption, and a marked departure from the 17-percent increase that had been projected for the 2008–18 period. The OEWS also recorded a decline from 1999 to 2009 (−8.0 percent) despite the robust increase in jobs overall during this period.

Radiologists

Many consider radiology to be a clear case of a highly skilled white-collar occupation facing serious competition from deep-learning-based AI because of breakthroughs in image recognition after 2010 .[34] Numerous research papers show AI performance in automated image interpretation meets or exceeds those of radiologists and other medical professionals, generating considerable anxiety within these specialties.[35] Some believe automated medical image reading will change the task content of radiology jobs but not greatly reduce employment.[36] However, in 2016, Geoffrey Hinton, considered the father of deep learning and modern AI, said he thought the outlook for radiology jobs in the next 5 to 10 years was quite negative.[37] Likewise, a paper in a leading radiology publication agreed that "machine learning will become a powerful force in radiology in the next 5 to 10 years [2021–26], not in multiple decades…. Indeed, in a few years there may be no specialty called radiology."[38]

BLS does not track the number of radiology jobs specifically, but the American Medical Association has tracked employment and major professional activity for all physicians and numerous medical specialties over time. According to these data, the total number of physicians whose main activity was patient care increased from 647,430 in 2000 to 870,264 in 2019, nearly 16.8-percent growth per decade. The number of radiologists whose main activity was patient care increased from 28,444 in 2000 to 37,068 in 2019, or by 15.0 percent per decade, as shown in chart 2. This makes radiologists a small occupation by the standards of the previous section. Radiologists as a share of all physicians fluctuated between 4.40 and 4.50 percent for almost all years between 2000 and 2014, then decreased to 4.26 percent by 2019, shown in chart 3. Understanding the reasons for the relative decline would require further study, but it is both rather gradual and offset by the overall expansion in healthcare such that the absolute number of radiologists has not declined appreciably.[39] Clearly, predictions of rapid labor substitution by AI are unlikely to be realized. Nevertheless, projections prepared for the Association of American Medical Colleges make passing reference to model predictions of a declining demand for radiologists between 2019 and 2034, without mentioning any estimated magnitude.[40] Those projections are based on demographic changes and current treatment rates by group and do not take technological change into account.

View Chart Data

It is important to recognize that trends in demand for radiologists are strongly affected by imaging reimbursement policies, population aging, and radiologists' retirement rates.[41] In addition, the practice of radiology involves a wide variety of complex diagnostic and related tasks. How rapidly AI can scale to substitute for an appreciable number of those myriad tasks and any new ones that result from medical progress is an empirical question, but the process is likely to be gradual and far from realized by 2026.[42]

Fast food and counter workers

In 2012, a San Francisco startup demonstrated a fully automatic machine for making hamburgers that purportedly produced 350 complete burgers per hour and would pay for itself in under 1 year of operation. These and similar robotic food preparation machines prompted some to consider that fast food employment could be cut by 25–50 percent by 2030, or some similar date.[43] However, BLS projections to 2029 foresee 11.4-percent growth in this occupation, following nearly 30-percent increase for the 2008–18 period and 35-percent growth for the 1999–2009 period. The projections for the 2008–18 period (13.7 percent) underestimated actual growth considerably, so it will be interesting to see whether this occupation also grows faster than projected for the 2019–29 period.

Janitors and cleaners, and maids and housekeeping cleaners

The first robot vacuum cleaners were introduced in 2002, and their mapping and navigation software has grown much more sophisticated over time. Their early introduction provides a long timeframe to test the idea that even automation substituting for only some of an occupation's component tasks will reduce the size of the occupation proportionately. More recently, robotic commercial floor cleaners have appeared, and such cleaning tasks are considered ripe for further substitution by robots.[44] Both janitors and maids and housekeepers are quite large occupations. (See table 2 and chart A-1 in the appendix.) However, janitor jobs are projected to increase by 4.4 percent from 2019 to 2029, roughly in line with their modest growth rates since 1999. The number of maids and housekeepers have contracted modestly over time. The OEWS series used for the 1999–2009 period includes only wage and salary workers, while projections and observed data for the 2008–18 period and the 2019–29 period also include the self-employed, which increases the number of maids and housekeepers by more than two-thirds when comparing figures for 2008 and 2009. As such, comparisons across data series should not be made for this occupation. However, the projections show the total number of maids and housekeepers declined by less than 0.3 percent between 2008 and 2018, despite 16 years of robot vacuum sales, and a similar decline is projected for the 2019–29 period. Although private households have long sought relief from the task of vacuuming, which accounts for a meaningful share of work time for maids and housekeepers, the availability of robot vacuums does not seem to have made large inroads into the number of jobs in this occupation and is not expected to do so by 2029.

Landscaping and groundskeeping workers

Robot lawn mowers that work without a human operator have attracted attention for years and have been cited as putting jobs at risk.[45] However, one leading roboticist, the cocreator of the robotic vacuum cleaner, is skeptical that they can be easily adapted for work on commercial properties.[46] BLS projects that jobs in this occupation will increase 10 percent from 2019 to 2029, though employment was flat from 2008 to 2018, when projections anticipated 18-percent growth, in contrast to the 16.3-percent growth recorded in the OEWS database for 1999 to 2009.

Heavy and tractor-trailer truck drivers

Driverless trucks have often been seen as the most likely near-term application of self-driving vehicles , though other writers on automation are more cautious about the ability of the technology to dispense with drivers entirely.[47] Jobs in this occupation are projected to increase 1.5 percent between 2019 and 2029, which, while representing a slowdown from 2008 to 2018 (8.9 percent), is more rapid than the 0.5 percent decrease recorded in the OEWS database for 1999 to 2009.

Industrial truck and tractor operators

Forklifts and other material-moving vehicles and carts represent another application of mobile robotic technology.[48] However, industrial truck and tractor operators jobs are projected to remain stable between 2019 and 2029, continuing a pattern observed at least as far back as 1999, perhaps partly reflecting the growth in e-commerce.

Laborers and freight, stock, and material movers, hand

Increased use of robots in warehouse operations might be expected to reduce the number of stock-handling jobs.[49] However, projections anticipate the occupation will grow 4.2 percent between 2019 and 2029, a slowdown from the remarkable 27.5-percent growth over the 2008–18 period that may have reflected the growth of e-commerce. However, the projections for the 2008–18 period proved much too pessimistic (−0.8 percent), so more robust growth than projected for the 2019–29 period is possible. In any case, the projected growth for 2029 is comparable to the growth recorded in the OEWS database for the 1999–2009 period (4.9 percent).

Occupations also affected by previous waves of computing technology

Seventeen occupations used as examples in the recent automation literature have been affected by prior waves of computing technology, in addition to any effects from innovative robots and AI (see table 3, bottom panel). Therefore, recent and projected trends in employment in these occupations may reflect the continuing effects of previous waves of computing whose ultimate impact is not yet fully realized. Fourteen of these occupations are projected to decline or grow by at least half a percentage point below average from 2019 to 2029. Eleven of these 17 occupations declined between 2008 and 2018, and 7 also declined between 1999 and 2009. Clearly, the occupations exposed to prior waves of computing have more consistently negative employment trends and projected trends than the occupations more plausibly affected only by recent advances in AI and robotics.

Loan officers

Recent research on automation notes that traditional algorithms threaten to automate the mortgage origination tasks of loan officers.[50] Projections anticipate modest growth (3.2 percent) to 2029, though the slight decline during the 2008–18 period (−3.2 percent) was not anticipated by the projections (10.1 percent), so it would not be surprising if future growth were modestly negative, as well. By contrast, the OEWS database registered robust growth (49.0 percent) from 1999 to 2009.

Tax preparers

Recent writing cites tax preparers as affected negatively by the ready availability of tax preparation software packages, as well as offshoring.[51] These software packages may use an earlier, rule-based form of AI called expert systems. The BLS projections anticipate this occupation will decline by 0.6 percent by 2029, though the decline for the 2008–18 period (−9.7 percent) was not anticipated by the projections for that period (2.9 percent). Nevertheless, this occupation grew 5.2 percent from 1999 to 2009, despite the general availability of tax software during that period.

One source credits the leading tax program with putting many jobs at risk by "allowing a machine to do the jobs of hundreds of thousands of human tax preparers."[52] However, the total number of dedicated tax preparer jobs never reached 100,000 according to available occupation statistics. The occupation grew from 69,000 in 2000 to 96,000 in 2008, then declined by 9,300 jobs to 87,000 jobs in 2018.[53] (See tables 2 and 3.)

In fact, high rates of part-year and part-time work make determining the exact number of tax preparers rather complicated. Every year, jobs in the tax preparation services industry peak in February and decline 70–80 percent by July or August.[54] The OEWS data will miss the peak because the program gathers data in May and November. The Quarterly Census of Employment and Wages, which is the source of the figures just cited, collects data each month, but only captures jobs by industry, not by occupation. However, if the core occupation were at risk from expert systems software, it may be reasonable to consider much of the rest of the industry vulnerable as well. Chart 4 shows trends in the tax preparation industry's employment for 2001 to 2019 using both February and annual average figures.[55] Both series show jobs growing from 2001 to 2009 before falling back to levels similar to those in 2001 by 2019, though the downward trend is much more modest for the annual average. Whether this decrease is merely a return to prior levels or the first stage of a long-

run decline remains to be seen. Some fraction of accountants also engages in tax preparation, but job and task variety within that occupation would be expected to buffer the employment effects of tax software within the occupation.

Chart 4. Employment trends in tax preparation services (North American Industry Classification System 54-1213), February peak and annual average

Computer programmers

There have been previous efforts to automate aspects of software production, such as the development of computer-aided software engineering tools. Although some current writing on automation believes algorithms are likely to replace human programmers , others consider this to be a more distant prospect or even less likely.[56] Artificial intelligence has been used to create programs that can automatically write computer code in response to plain-language requests, but the code often fails or requires modifications by humans, limiting potential use.[57] Information technology occupations have tended to grow strongly despite the growth of automation and software tools, and current projections anticipate they will continue to do so. One exception is the computer programmer occupation, which is projected to decline by 9.4 percent from 2019 to 2029. However, BLS projections research attributes this mostly to offshoring. The projected magnitude may be an underestimate given the actual decline for the 2008–18 period (−41.3 percent) was far greater than projected (−3 percent), despite a similar decline registered in the OEWS database from 1999 to 2009 (−30.4 percent). Nevertheless, the importance of offshoring complicates any effort to attribute the declining number of jobs in this occupation to automation or AI.

Lawyers and paralegals and legal assistants

Lawyers and paralegals have been affected by a form of offshoring known as legal process outsourcing, as well as by cost-cutting pressures during and after the financial crisis of 2007–08.[58] However, the increased ability of AI software to process troves of electronic documents has led to suggestions that tasks performed by lawyers, paralegals, and related occupations may be under much greater threat from future automation.[59] By contrast, Professors Dana Remus and Frank Levy find lawyers' tasks are much more diverse than recognized in these writings, and only about 4 percent of billed hours are spent on document review, which is the only task strongly susceptible to automation.[60] Consistent with this view of modest task substitution, BLS projects jobs will increase 4.0 percent for lawyers and 10.4 percent for paralegals between 2019 and 2029, though, again, this represents a slowdown for both groups relative to the 2008–18 period (8.5 percent and 13.7 percent) and even more so compared with rates recorded in the OEWS database for the 1999–2009 period (13.0 percent and 26.3 percent). Although the projections anticipate paralegals will take on more of the tasks previously assigned to legal secretaries and entry-level attorneys, BLS research economists do not consider technology to be a major driver of employment growth for these occupations.

News analysts, reporters, journalists and public relations specialists

Even more than legal occupations, journalist jobs have been changed by prior technology, most notably the internet and social media, which have led to declining readership and lower advertising revenue for many long-established news outlets. However, AI is now being used to compose simple news stories, corporate earnings reports, and similar reading matter, potentially reducing the need for journalists and public relations personnel.[61] The projections anticipate news-related jobs will decline by 11.2 percent between 2019 and 2029, although this decline would be more moderate than the declines for the 2008–18 period (−28.3 percent) and recorded in the OEWS database for the 1999–2009 period (−19.6 percent). However, the decline for 2008–18 was much greater than projected (−6.3 percent), so it is possible that the projected decline for 2029 is also an underestimate.

By contrast, the number of public relations specialists is projected to grow more than 7 percent between 2019 and 2029. Comparable figures are not available for 2008 to 2018, but the occupation grew much faster from 1999 to 2009, more than doubling according to the OEWS database. Nevertheless, this occupation is likely an example in which AI may automate certain tasks, like composing certain kinds of press releases, without substituting for enough tasks within the occupation to meaningfully decrease employment.

First-line supervisors of retail sales workers, retail salespersons, counter and rental clerks, and cashiers

Occupations in retail have been cited as vulnerable in recent work on automation.[62] The projections for 2019–29 agree that retail jobs are likely to decline. However, prior technologies, such as e-commerce and mobile apps, are likely to be more important than AI and robotics.[63] Projections research finds cashiers are also likely to decline because of greater use of self-checkout, mobile payments, and the bundling of checkout tasks into retail salespersons' jobs, none of which rely heavily on AI. Cashiers are projected to decline by 7.4 percent between 2019 and 2029 after growing by 2.8 percent (2008–18) and 8.8 percent (1999–2009). Jobs for retail salespersons and counter and rental clerks are projected to be flat, continuing the trend from 2008–18, while the number of first-line retail supervisors is expected to decline modestly (−5.5 percent), continuing a trend visible since 1999.

Customer service representatives and telemarketers

Telemarketers and customer service representatives (CSR) have been replaced or supplemented with interactive voice response systems that can present callers or listeners with a preprogrammed set of options and, in some cases, interpret human speech and respond flexibly to queries in a limited fashion. Some see these jobs as vulnerable to replacement as artificial intelligence improves while others view customer service jobs as less amenable to automation because customer queries make tasks unpredictable .[64] In fact, CSR jobs are projected to remain stable, after growing by 32 percent (2008–18) and 23 percent (1999–2009), despite marked increases in the offshoring of CSR jobs over time. Projections research finds telemarketing jobs are more threatened by increased use of digital marketing than AI. Telemarketing jobs are anticipated to fall 14.2 percent over 2019–29, which may be optimistic given previous declines of 51 percent (2008–18) and 37 percent (1999–2009), which projections research attributed mostly to the increased use of digital marketing than AI. Telemarketing jobs are anticipated to fall 14.2 percent over 2019–29, which may be optimistic given previous declines of 51 percent (2008–18) and 37 percent (1999–2009), which projections research attributed mostly to the increased use of "do not call" registries and caller ID functions on telephones, rather than automation.

Stockers and order fillers

As e-commerce has increased the need for efficient warehouses, efforts to automate warehouse operations have grown. Advances in warehouse robotics have received particular attention, but the focus on technological substitution usually does not account for the scale effects of e-commerce expansion.[65] In addition, only about 20 percent of stockers and order fillers are employed in the warehouse and storage industry, in which the introduction of robots is furthest along. As such, this may be another example in which job diversity within an occupation limits the potential for technological substitution.[66] BLS projects this occupation will grow 0.7 percent between 2019 and 2029, much less than the 10.6-percent growth between 2008 and 2018 (which was close to the projected value of 7.2 percent), and also less than the more modest 3.5-percent growth in the OEWS between 1999 and 2009. The projection of stable employment to 2029 reflects the combined effects of labor substitution due to various technologies (automated order-taking systems and automated storage and retrieval equipment based on sensors, bar codes, and radio frequency identification) and the growth of labor demand for tasks that technology cannot replace, a scale effect. Many of the computing technologies, as well as e-commerce itself, predate the recent wave of mobile robotics and machine learning, so there is some element of technological continuity in this case. Given the continued expansion of e-commerce, occupational employment trends in this sector may be a race between increasing technological capabilities and increasing demand for the industry's output.

Reservation/transportation ticket agents

Many of the functions of this occupation have been replaced by websites.[67] The projections anticipate ticket agent jobs will drop nearly 3 percent from 2019 to 2029, which would represent significant moderation of the 20.5-percent decline from 2008 to 2018. However, the projections for 2008–18 anticipated job growth (8.1 percent), so there may be similar issues with the projections to 2029. Nevertheless, the decline from 2008 to 2018 was more moderate than the decline from 1999 to 2009 (−35.9 percent), so there is no evidence of accelerated job loss either.

Farmworkers and agricultural equipment operators

A number of agricultural robots are dexterous enough to milk cows, apply fertilizers and pesticides, prune grape vines, and harvest oranges, strawberries, and almonds.[68] However, farm jobs have been declining for many decades, so the extension of machines to fine motor tasks such as picking fruits and vegetables would represent a kind of handoff between older and newer technologies, rather than an entirely new area in which technology substitutes for labor. Nevertheless, this group of occupations is projected to grow by 1.0 percent between 2019 and 2029, after having grown more than 9.0 percent from 2008 to 2018, despite projections of 2.4-percent decline. According to the BLS projections research, this is because the effect of further mechanization, which reduces labor demand, is expected to be more than offset by increases in production, a scale effect. For table 2 and table 3, this group also includes agricultural equipment operators, who are projected to grow, in order to capture slightly offsetting job growth due to increased technology use in these work settings. The OEWS database recorded 8.9-percent growth for this occupation from 1999 to 2009, but the OEWS database excludes most agriculture-related industries so comparisons between the two series are inappropriate for this sector.

Welders

Welding was one of the earliest applications of industrial robotics and remains one of the most common uses of commercial robots.[69] However, after declining nearly 17 percent between 1999 and 2009, the number of welders remained relatively flat over 2008–18, consistent with projections. The projections for 2019–29 also anticipate little change.

Occupations losing the most jobs, 2008–18

The previous sections examined employment trends in occupations selected because of their presumed vulnerability to new automation technologies. By contrast, this section begins with the occupations that have experienced the largest job losses and discusses the technologies that may be responsible for their decline.

Table 4 is based on the same 669 occupations in the OEWS database as table 1. The top row shows that employment in these occupations increased 17 percent over the 19-year period, 1999 to 2018. Among 238 occupations that experienced large losses (greater than 5 percent) between 1999 and 2018, the total number of jobs declined by 8.5 million, or 31 percent, over 19 years (row 2). Relative to all jobs in 1999, this represents a loss of 7.4 percent. Because the number of jobs increased overall, retaining the jobs that were lost would have increased the total in 2018 by somewhat less (6.4 percent). Both figures are many times smaller than the widely cited 47-percent job loss envisioned for the 2010–30 period, despite reflecting other forces, such as trade and offshoring, in addition to technological change. In addition, the losses were more than offset by job gains elsewhere, as the total number of jobs increased by more than 19 million between 1999 and 2018, implying the other occupations gained more than 28 million jobs.

Table 4. Top 30 detailed occupations losing jobs, 1999–2018

SOC code	Title	1999	2018	Change	Percent change
[1]	All occupations	114,728,000	134,219,408	19,491,408	17.0

SOC = Standard Occupational Classification system. There are 669 occupations that could be tracked consistently over 1999–2018. There were 248 occupations that lost more than 5 percent of jobs and 84 occupations that lost more than 45 percent of jobs. Occupations known or believed to have declined because of changes in coding practices are excluded from the table. The final column is percent change for 1999–2018. All occupation codes are from SOC 2000, except SOC 51-9151 (photographic process workers), which harmonizes occupational categories across classification systems to the SOC 2010 value. Values in the bottom row are column totals. Between 1999 and 2018, the total number of jobs in these 30 occupations declined by 61.0 percent.
Source: U.S. Bureau of Labor Statistics, Occupational Employment Statistics 1999–2018.

There is a much smaller group of 81 occupations whose employment declined by more than 45 percent between 1999 and 2018, equivalent to a 47-percent drop over two decades. The total number of jobs in this group decreased by more than 62 percent (table 4, row 3). However, the 4.4 million jobs lost represent only 3.8 percent of all jobs in 1999 and would have added only 3.3 percent to the total in 2018 had they not been lost. Even though the percent losses within these occupations were similar to those foreseen in the recent automation literature, they were quite atypical, so their effect on overall employment was much smaller than the magnitude of their decline might suggest. This is not intended to minimize the number of jobs lost, the hardships experienced by workers affected by them, or the implications of the changing occupational composition for inequality and economic opportunity more generally. However, the incidence of these dramatic declines is more than an order of magnitude smaller than the 47-percent potential job losses commonly cited in the automation literature. One can find particular occupations that experienced dramatic job losses, but they do not generalize to the broader workforce, even during the first decade of the new wave of robotics and AI. The future would have to diverge dramatically from past patterns for job losses overall to reach 47 percent over 20 years.

Table 4 shows the 30 detailed occupations that lost the largest absolute number of jobs between 1999 and 2018, in descending order.[70] Except for four occupations that each declined nearly 45 percent, this group is a subset of the 81 occupations discussed above. This group accounts for 81 percent of jobs in occupations experiencing large percent drops. The total number of jobs in this group decreased 61 percent over 20 years. These occupations are notable for the apparent influence of previous waves of computing technologies (for example, those used for data entry keyers, word processors, file clerks, switchboard operators) and previous waves of mechanical technologies (for example, those used by sewing machine operators, mail sorters), as well as possible effects of trade and offshoring. The large decline in sewing machine operators reflects the continuation of a decades-long trend, while the large decline in word processors and data entry keyers reflects the ongoing effects of the microcomputer revolution beginning in the early 1980s and subsequent growth of digital

data capture. Although the newest technologies attract the greatest attention, most of the major contractions appear to reflect long-run implications of more established technologies, whose full effects unfold over many decades. In terms of overall magnitude, even these reductions represent a 20-year loss of only about 2.5 percent of jobs, whether calculated with 1999 or 2018 totals as the base value.

High-technology occupations

Finally, consideration of the new technology raises the question of the jobs they create, as well as replace. Tables 5 and 6 show trends in science, technology, engineering, and mathematics-related (STEM) jobs. The projections anticipate that computer-related jobs will increase 11.5 percent between 2019 and 2029. However, this may be an underestimate, given growth rates around 30 percent between 1999 and 2018, which were somewhat underprojected for the 2008–18 period. Math-related occupations have grown even faster and are projected to continue to do so for the 2019–29 period, but this group is only about one-twentieth the size of the ICT occupational group. The most notable developments include the near doubling of statistician jobs from 2008 to 2018 and the emergence of data scientist as a recognized occupation. It seems likely that these trends reflect the increasing need for workers in fields like machine learning and data analytics. Some of these jobs produce the software whose potential to replace other kinds of labor have prompted recent concerns. Nevertheless, these two occupations together accounted for only 76,000 jobs in 2019 and were projected to grow to 101,000 jobs by 2029. Other STEM occupations experienced even weaker performance, lagging overall job growth between 2008 and 2018 and projected to continue to do so between 2019 and 2029.

Conclusion

Numerous observers believe recent developments in robotics and AI may cause an unprecedented wave of automation-related job losses. In this view, the new technology is fundamentally different from earlier waves of computing technology because it improves at an accelerating rate and substitutes for a much wider range of job tasks. A widely cited scenario estimates that 47 percent of jobs are susceptible to automation between 2010 and 2030, implying a decisive break with previous rates of occupational growth and decline. As part of this argument, proponents have cited 28 detailed occupations as notably susceptible to job loss due to new technology. However, these occupations did not exhibit any general tendency toward notably rapid job loss in the first half of this period (2008–18) and are not projected to experience such losses in the second half (2019–29). Occupations that did decline were mostly those that were vulnerable to previous waves of computing technology and other trends, such as offshoring, rather than occupations newly susceptible to automation due to AI and advanced robotics. Actual job losses within these occupations for 2008–18 and the losses projected for 2019–29 often exhibit continuity with previous trends dating to 1999–2009 and are generally within the range of typical growth rates observed for all occupations for 1999–2018. This points to the importance of carefully distinguishing the effects of different generations of computing technology in any discussion of individual cases and overall trends. In general, most occupations are small, few decline by 30 percent or more over 10 years, and those that do so account for a small share of the total number of jobs. Although the performance of the 2008–18 projections with respect to these occupations taken individually was varied, the projections' performance was strong for the group overall. The performance of the 2008–18 projections provides no reason to suppose that the projections to 2029, which also foresee gradual changes rather than a break with previous trends, systematically underestimate future job losses.

Even among the occupations cited in the automation literature, rates of actual and projected job loss rarely reached levels that the automation literature suggests are becoming common or soon will be. Although there are large occupations that experienced large percent declines over two decades, those occupations account for much less than 47 percent of jobs, and their losses are more than offset by growth in other occupations, which is to say those jobs are not representative of a broader trend.

Part of the reason new technology does not produce sharper changes in employment is the diversity of jobs within occupations and the diversity of tasks within jobs, not all of which are equally susceptible to technological substitution. Automation of some tasks may also alter the task composition of jobs, rather than simply reducing the number of jobs. The growth of product demand within industries implementing new technology can buffer the employment effects of

technological change. On a broader scale, population growth and economic growth are associated with expanding employment. It is also possible that adoption rates for new production technology are more gradual than commonly assumed. The automation literature implicitly claims that technological substitution will be so great as to dominate any offsetting forces, producing unusually large job losses. However, the total number of jobs grew after the AI breakthroughs of the early 2010s, and BLS projects it will continue to do so, as will most of the specific occupations the automation literature considers to be on the leading edge of this wave of technological displacement.

Fears that automation will cause widespread job losses have been raised repeatedly in the past, which, in retrospect, usually greatly overestimated the scale of actual displacement. Recent experience and projections suggest a similar pattern may be occurring with recent developments in AI and robotics. For various reasons, technological change seems to be generally more gradual than commonly recognized. Prior waves of computing may be too familiar to receive much attention from observers of emerging trends, but their immediate effects are probably smaller than anticipated and their full impact unfolds gradually over a longer timeframe than recognized. None of this is to minimize the hardships experienced by displaced workers. However, rapid leaps in technology in the early 2010s prompted many to envision a future scenario of massive disruption. This article has examined specific occupations that are most favorable to the automation thesis and found little support for this view. It is entirely possible that robotics and AI are simply another in a long line of waves of innovation whose effects on employment will unfold at rates comparable to those in the past.

ACKNOWLEDGEMENT: I would like to thank Elizabeth Cross, Richard Freeman, Maury Gittleman, Lindsey Ice, Emily Krutsch, and Emily Rolen for very helpful comments on previous versions of this paper. I would like to thank Michael Wolf for very helpful comments, wide-ranging discussions, and assistance with the data used in this paper. I thank Stephen Pegula for providing data on radiology employment.

Appendix: The distribution of occupational sizes

The automation literature and discussions of changes in the nature of work more generally often use specific occupations as illustrations of what are believed to be general trends. It is useful to have a better understanding of the range of occupational sizes in both absolute and relative terms to have some yardstick for judging whether any given occupation of interest is large or small. The mean occupation, which has approximately 200,000 jobs, could serve as a dividing line between large and small occupations, while the median, which is much smaller (approximately 54,000 jobs), is probably much too small to serve as a useful benchmark, though it does indicate the highly skewed nature of the distribution. In fact, a closer examination shows that there are relatively few occupations that can be considered large by most reasonable standards and many occupations that are small.

Table A-1 shows the distribution of occupations by size decile, with each decile containing about 79 occupations. The largest occupation accounted for 2.7 percent of jobs in 2019 (column 4), but the smallest occupation in the top decile had less than 0.3 percent of all jobs (column 3). The average occupation in the top decile had nearly 1.3 million jobs (column 1) and accounted for about 0.8 percent of all jobs (column 2). By contrast, the average occupation in the median (fifth) decile had only 67,000 jobs and accounted for 0.04 percent of all jobs. The number of jobs per occupation and their percent shares decline further from there. Collectively, the top two deciles, 158 occupations out of 790 total, accounted for over 78.1 percent of all jobs (column 6), while the remaining 632 occupations accounted for the remaining 21.9 percent of jobs. The bottom half of the distribution (395 occupations) accounted for only about 5.3 percent of all jobs. Clearly, any reference to a particular occupation as susceptible to automation will have very different implications depending on whether it is among the few large ones or the many small ones. If the latter, then the portrait of automation's impact can easily be unrepresentative. Even among the largest occupations, there are many that account for only 0.15 percent to 0.30 percent of all jobs.

Table A-1. Size distribution of occupations by decile, 2019

Decile	Mean jobs per occupation (thousands)	Percent of all jobs in decile's mean occupation	Percent of jobs in decile's smallest occupation	Percent of jobs in decile's largest occupation	Total jobs in decile	Decile's percent share of all jobs
1	1,267.9	0.78	0.29	2.69	100,167.3	61.53
2	341.7	0.21	0.14	0.28	26,996.7	16.58
3	168.1	0.10	0.08	0.14	13,283.4	8.16
4	106.9	0.07	0.05	0.08	8,445.6	5.19
5	67.3	0.04	0.03	0.05	5,316.5	3.27
6	44.0	0.03	0.02	0.03	3,432.8	2.11
7	29.8	0.02	0.02	0.02	2,382.5	1.46
8	19.0	0.01	0.01	0.01	1,497.2	0.92
9	11.6	0.01	0.01	0.01	894.9	0.55
10	4.7	0.00	<0.001	0.01	379.7	0.23
All deciles	**206.1**	**0.13**	**0.00**	**2.69**	**162,796.6**	**100.00**

Note: Assignment to occupational deciles is based on the number of jobs in an occupation. Deciles are shown from largest to smallest. Each decile contains 79 occupations, aside from ties. Figures in columns refer to (1) average number of jobs per occupation (in thousands), (2) average percent share of jobs per occupation, (3) minimum and (4) maximum percent shares of occupations in decile, (5) total number of jobs in decile (in thousands), and (6) the decile's percent share of all jobs. Figures in the bottom row for all cases are means (columns 1 and 2), minimum and maximum values (columns 3 and 4), and sums (columns 5 and 6).
Source: U.S. Bureau of Labor Statistics, occupational projections file for 2019–29.

As an aside, because the largest approximately 20 percent of occupations account for nearly 80 percent of all jobs, it is natural to ask whether occupational size follows a power law. According to this mathematical model, the natural log of an occupation's size is related linearly to the natural log of its rank, sorted from largest to smallest.[71] Chart A-1 plots log occupation size against log occupation rank. The relationship is far from linear, and even a quadratic function (see chart A-2) shows significantly poor fit at either end, where actual occupational employment is much lower than predicted. Occupational size does not follow a power law. In fact, the distribution of occupational employment is strikingly close to a lognormal distribution (see chart A-3), which is also consistent with a highly skewed size distribution containing a large mass of relatively small occupations and a long tail containing a small number of large occupations.[72]

Table A-2 shows occupations at different points of the size distribution and the number of jobs and share of all jobs they represent. In addition to the 20 smallest and 20 largest occupations, the table includes twenty occupations increasing in size from the median. These figures provide another perspective on how rapidly the size of occupations drops and can serve as reference points for the discussion of automation's possible impacts. Some of the large occupations, such as material movers, heavy truck drivers, and household and commercial cleaners, figure prominently in discussions of the increasing power of robots and AI, but others, like those related to nursing and personal care aides, do not. Occupations like retail salespersons, cashiers, and bookkeeping, accounting, and auditing clerks are somewhat more ambiguous, because they have been affected by prior waves of computing technologies, such as microcomputers, e-commerce, and self-checkout, in addition to any effects of newer technology like robots and AI.

Table A-2. Number of jobs and share of jobs in selected detailed occupations, 2019

SOC code	Occupational title	Jobs (thousands)	Percent
	Twenty largest occupations		
41-2031	Retail salespersons	4,371.4	2.685
35-3023	Fast food and counter workers	4,047.7	2.486
41-2011	Cashiers	3,600.9	2.212
31-1120	Home health and personal care aides	3,439.7	2.113
43-9061	Office clerks, general	3,126.3	1.920
29-1141	Registered nurses	3,096.7	1.902
43-4051	Customer service representatives	3,018.8	1.854
53-7062	Laborers and freight, stock, and material movers	2,986.0	1.834
35-3031	Waiters and waitresses	2,613.8	1.606
11-1021	General and operations managers	2,486.4	1.527
37-2011	Janitors and cleaners, except maids and housekeepers	2,374.2	1.458
43-6014	Secretaries and administrative assistants	2,250.2	1.382
53-7065	Stockers and order fillers	2,135.8	1.312
53-3032	Heavy and tractor-trailer truck drivers	2,029.9	1.247
43-3031	Bookkeeping, accounting, and auditing clerks	1,673.6	1.028
43-1011	First-line supervisors of office and administrative support	1,552.4	0.954
31-1131	Nursing assistants	1,528.5	0.939
49-9071	Maintenance and repair workers, general	1,516.4	0.931
41-1011	First-line supervisors of retail sales workers	1,476.4	0.907
37-2012	Maids and housekeeping cleaners	1,474.9	0.906
1	**Total**	**50,800**	**31.203**
	Twenty middle-sized occupations		
51-7041	Sawing machine setters, operators, and tender	54.5	0.033
49-9062	Medical equipment repairers	53.9	0.033
11-1031	Legislators	53.7	0.033
45-1011	First-line supervisors of farming, fishing,	53.2	0.033
49-9012	Control and valve installers and repairers,	53.1	0.033
51-9012	Separating, filtering, clarifying machine setters, operators	53.1	0.033
47-2121	Glaziers	52.8	0.032
43-9022	Word processors and typists	52.7	0.032
11-9039	Education administrators, all other	52.1	0.032
27-3023	News analysts, reporters, and journalists	52.0	0.032
27-1023	Floral designers	51.8	0.032
47-5013	Service unit operators, oil and gas	51.7	0.032
33-9093	Transportation security screeners	51.4	0.032
29-1011	Chiropractors	51.1	0.031
31-2022	Physical therapist aides	50.6	0.031
31-1132	Orderlies	50.6	0.031
23-2099	Legal support workers, all other	50.4	0.031
39-2011	Animal trainers	50.2	0.031
29-1298	Acupuncturists, healthcare diagnosing/treating, all other	49.6	0.030
29-1216	General internal medicine physicians	49.5	0.030
1	**Total**	**1,038.0**	**0.637**
	Twenty smallest occupations		
15-2021	Mathematicians	2.9	0.00178
19-1011	Animal scientists	2.8	0.00172
41-9012	Models	2.7	0.00166
29-9092	Genetic counselors	2.6	0.00160
53-4099	Rail transportation workers, all other	2.5	0.00154
25-1192	Family and consumer sciences teachers, postsecondary	2.5	0.00154

SOC = Standard Occupational Classification system. Number of jobs is in thousands. This table omits some occupations with larger declines over the period because of known changes in coding practices designed to address title inflation in some occupations (SOC 11-1011, chief executives and other managerial occupations; SOC 43-6011, executive secretaries/administrative assistants). Others are omitted because of presumed changes in coding practices (SOC 47-3012, helpers–carpenters; SOC 49-9098, helpers–installation, maintenance, and repair). Declines in the sizes of these occupations are not believed to reflect actual changes in the economy for the most part.

13 For an example of this misunderstanding, see Olivia Solon “Self-driving trucks: what's the future for America's 3.5 million truckers?” *The Guardian*, June 17, 2016, https://www.theguardian.com/technology/2016/jun/17/self-driving-trucks-impact-on-drivers-jobs-us. For clarification on the diversity of jobs within this broad occupation, see Maury Gittleman and Kristen Monaco, “Truck-driving jobs: are they headed for rapid elimination?” *Industrial and Labor Relations Review* vol. 73, issue 1, January 2020, pp. 3–24, https://doi.org/10.1177%2F0019793919858079.

14 Gittleman and Monaco, “Truck-driving jobs: are they headed for rapid elimination?”

15 For an example, see *Jobs lost, jobs gained* (McKinsey Global Institute), p. 6.

16 Prior versions of Brynjolfsson and McAfee’s *The second machine age* and Frey and Osborne’s “The future of employment” appeared in 2011 and 2013, respectively. Both versions of Frey and Osborne’s paper use a 20-year forecast interval with 2010 as the base year. This window aligns well with the occupational data and projections for 2008–18 and 2019–29 used in this article. The 2008–18 projections are used for the previous decade because the program operated on a biennial schedule prior to 2019, so there were no projections for the period 2009–19. The base year employment for 2008–18 is also much less affected by the downturn of the Great Recession than if 2009 were the base year.

17 See Dubina, Morisi, Rieley, and Wagoner, “Projections overview and highlights.” Effects of COVID-19 on recent occupational employment are covered in a separate, companion paper (see note 1 for the presentation on that unpublished paper).

18 For further details on the Employment Projections program, see https://www.bls.gov/emp.

19 Frey and Osborne, “The future of employment.”

20 For further details on the Occupational Employment and Wage Statistics (OEWS) program, see https://www.bls.gov/oes. Note that after the data used in this article were collected, the program’s name changed to the Occupational Employment and Wage Statistics program.

21 See note 1.

22 Frey and Osborne, “The future of employment.” If an occupation shrinks at a rate of 27 percent per decade, after 10 years it will be 0.73 times the base-year value, and after 20 years it will be $(0.73)^2 = 0.53$ times the base-year value, representing a 47-percent loss.

66 For the industrial distribution of this occupation, see https://www.bls.gov/oes/current/oes537065.htm.

67 Brynjolfsson and McAfee, *The second machine age*, p. 137.

68 Ford, *Rise of the robots*, p. 23ff.

69 *Jobs lost, jobs gained* (McKinsey Global Institute), p. 26.

70 Table 4 omits some occupations with larger declines over the period because of known changes in coding practices designed to address title inflation in some occupations (Standard Occupational Classification (SOC) system 11-1011, chief executives and other managerial occupations; SOC 43-6011 executive secretaries/administrative assistants). Others are omitted because of presumed changes in coding practices (SOC 47-3012, helpers–carpenters; SOC 49-9098, helpers–installation, maintenance, and repair). Declines in the sizes of these occupations are not believed to reflect actual changes in the economy for the most part.

71 Volker Nitsch, "Zipf zipped," *Journal of Urban Economics* vol. 57, issue 1, 2005, p. 89, https://doi.org/10.1016/j.jue.2004.09.002.

72 Taking the natural logarithm of occupational employment reduces the skewness of the size distribution from 4.9 to 0.1 and reduces the kurtosis from 32.3 to 2.8. The Shapiro-Francia test fails to reject the null hypothesis that the distribution is lognormal ($p > 0.17$), as does Stata's -sktest- command ($p > 0.20$), while the Shapiro-Wilk test is borderline ($p > 0.09$).

WORKFORCE AUTOMATION

Insights into Skills and Training Programs for Impacted Workers

GAO Highlights

Highlights of GAO-22-105159, a report to congressional committees

Why GAO Did This Study

Increasingly, technology is automating tasks previously performed by people. Automation has changed some jobs and eliminated others entirely. Thus some workers have had to retrain to learn the skills needed to keep their jobs or obtain new ones. Workers with lower levels of education who perform more routine tasks have tended to experience the greatest disruptions from automation, putting at risk jobs such as cashiers or clerical workers. House Report 116-450 included a provision for GAO to examine challenges and opportunities to provide training to workers at risk of losing their jobs to automation.

GAO examined (1) what available data indicate about which workers are at risk of automation and the skills needed for in-demand jobs; and (2) what insights stakeholders offer for workforce programs to better serve displaced workers and those affected by automation.

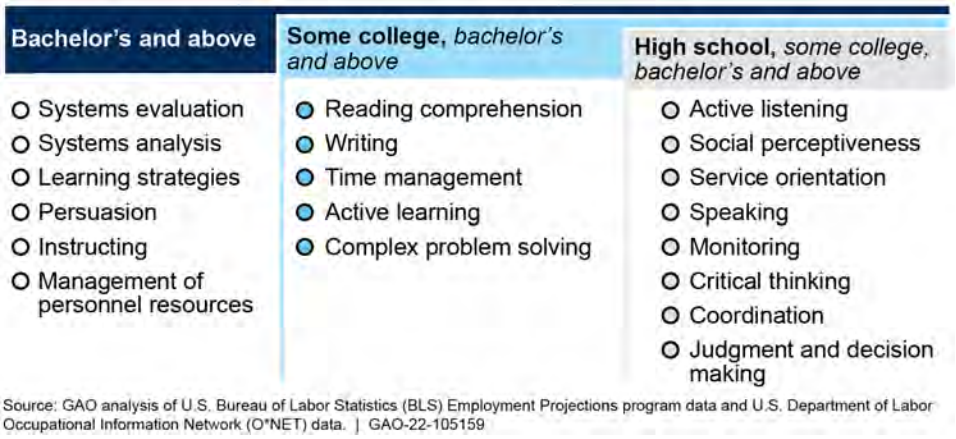
GAO analyzed DOL data to identify occupations projected to grow over the next decade, as well as the skills associated with those growing occupations. GAO also conducted case studies in four states, diverse across jobs and geography that were also recommended by national workforce organizations and others as having promising workforce responses to automation. In those states, GAO collected information related to both objectives. Additionally, GAO interviewed stakeholders from agencies and nine workforce, labor, business, and other organizations. GAO also reviewed relevant federal laws and regulations, prior GAO reports, and literature.

View GAO-22-105159. For more information, contact Dawn G. Locke at (202) 512-7215 or locked@gao.gov.

What GAO Found

Although available data do not explicitly identify workers at risk of losing their jobs to automation, they provide insight into the skills needed for jobs projected to be in high demand over the next decade. For example, Department of Labor (DOL) data show that in-demand jobs require a mix of skills, including soft skills and process skills that help a person acquire knowledge quickly, such as active learning and critical thinking. Federal data also indicate that in-demand jobs having a higher number of skills deemed important also tend to require higher levels of education. Further, research indicates that certain jobs and skills are less likely to be automated, including those involving management and social skills. State and other data can also inform which skills are most important for in-demand jobs in a given geographic area. DOL and the Department of Commerce are seeking additional data on skills that the general worker population will need for in-demand jobs in light of automation.

Skills Deemed Important in the Top 20 In-Demand Occupations, by Education Level Required



Source: GAO analysis of U.S. Bureau of Labor Statistics (BLS) Employment Projections program data and U.S. Department of Labor Occupational Information Network (O*NET) data. | GAO-22-105159

Note: These skills reflect a score of at least 3 in O*NET's 5-point scale of importance.

Officials in four case study states and other stakeholders GAO interviewed offered insights on how existing workforce programs could better serve displaced workers and those at risk of losing their jobs to automation who face challenges obtaining in-demand jobs. For example, several stakeholders suggested that training programs sometimes failed to focus on providing skills for in-demand jobs. Specifically, one state official said that some programs focus on interviewing and resume writing skills, rather than helping workers acquire the actual skills needed to perform the tasks for their next job. Other officials also noted that jobseekers faced barriers to accessing training, such as lack of childcare. Accordingly, stakeholders proposed strategies including (1) focusing training content on in-demand skills, (2) designing programs to maximize their accessibility, (3) increasing investment in training, and (4) collaborating with other workforce stakeholders to better serve workers displaced by automation.

In recent decades, technological advancements have allowed automation to perform tasks traditionally done by human workers—changing or eliminating some jobs on the one hand, and creating entirely new occupations and industries on the other.[1] In addition, several researchers have argued that the COVID-19 pandemic could have accelerated the adoption of certain technological changes in the nature of work, which could result in more robots in manufacturing and warehouses or more self-service kiosks in stores, for example.[2] These changes may also alter the types of skills needed for current and future jobs.

[1]In this report, we use "automation" to mean modifying processes to become more automatic by reducing human involvement.

[2]See, e.g., McKinsey Global Institute, *The future of work after COVID-19* (Feb. 2021); World Economic Forum, *The Future of Jobs Report 2020* (Switzerland: Oct. 2020); Burning Glass Technologies, *After the Storm: The Jobs and Skills that will Drive the Post-Pandemic Recovery* (Boston, MA: Feb. 2021). Moreover, there are a variety of factors that might affect a firm's decision to automate. For example, Acemoglu, Manera, and Restrepo (2020) argue that the U.S. tax system favors excessive automation. In particular, the study notes that the heavy taxation of labor and low taxes on capital encourage firms to automate more tasks and use less labor than is socially optimal. Daron Acemoglu, Andrea Manera, and Pascual Restrepo, "Does the U.S. Tax Code Favor Automation?" *Brookings Papers on Economic Activity*, Spring, 231-300.

The current U.S. workforce faces challenges to adapt to this evolving labor market. Automation may result in the elimination of certain jobs or require workers to retrain in order to keep their jobs or to obtain new ones. We use the phrase “at-risk workers” to describe those workers whose jobs are at risk of being partially or fully automated.

Federal, state, and local governments play a role in helping to ensure that the workforce is equipped to meet current and future labor market demands. The Department of Labor (DOL) creates projections to anticipate which jobs will grow the fastest—what we term “in-demand jobs”—and the skills needed for those jobs—what we term “in-demand skills.”[3] However, research has highlighted a widening gap between the skills needed for certain jobs and the skills of workers available for these jobs.[4] This gap is especially apparent in industries with high degrees of automation, such as health care, information technology, and manufacturing. Historically low unemployment has increased difficulties for employers looking to fill jobs involving skills needed for in-demand jobs. Additionally, it is unclear whether existing training opportunities can close this skills gap. One survey of warehouse workers found that 35 percent of participants were concerned that inadequate training resources would reduce their ability to succeed in a digital environment.[5]

House Report 116-450 of the Committee on Appropriations, to accompany H.R. 7614, Departments of Labor, Health and Human Services, and Education, and Related Agencies Appropriations Act, 2021

[3]Based on DOL data, we identified “in-demand jobs” as those occupations that were projected to add more than 7,600 jobs over the 2019 through 2029 period—i.e., the average job gain across all occupations over this period. Of these, we selected the 20 fastest-growing occupations. This eliminated occupations that are growing quickly but will add relatively few jobs. For example, the occupation of wind turbine service technicians is projected to grow by about 60 percent from 2019 to 2029, but will add fewer than 5,000 jobs over the period.

[4]See, for example, Boston Consulting Group, *Towards a Reskilling Revolution: A Future of Jobs for All*,” World Economic Forum (Geneva: January 2018) and Craig Giffi et al., 2018 *Deloitte and The Manufacturing Institute Skills Gap and Future of Work in Manufacturing Study* (Washington, D.C.: Deloitte Insights, 2018).

[5]Joe Lui et al., “Research: How Do Warehouse Workers Feel About Automation?” *Harvard Business Review* (Boston, MA: Feb. 11, 2022).

included a provision for GAO to examine challenges and opportunities to provide training to workers at risk of losing their jobs to automation.[6]

This report examines (1) what available data indicate about which workers are at risk of automation and the skills needed for in-demand jobs; and (2) what insights stakeholders offer for workforce programs to better serve displaced workers and those affected by automation.[7]

For our first objective, we analyzed DOL data to identify occupations projected to grow the fastest over the period 2019 through 2029, as well as the 2020 DOL data on skills associated with those growing occupations. We established the reliability of these data by reviewing DOL documentation and interviewing knowledgeable DOL staff. In addition, we used information from selected case study states, described below, to provide examples of data available on a state and local level with regard to in-demand jobs and skills needed.

To help address both objectives, we conducted case studies in four states, including those with a high concentration of jobs susceptible to automation based on a prior GAO report, diverse urban and rural geographies, a variety of in-demand jobs, and that were recommended to us by workforce stakeholders in early interviews as having promising workforce responses to automation. The states were California, Kentucky, Pennsylvania, and Washington. In each state, we conducted semi-structured interviews with state workforce boards, which included representation from government agencies, business, labor, and training providers.[8] We asked questions related to how the states collect data on in-demand jobs and any challenges to obtaining in-demand jobs within their state. We also asked for examples of workforce training programs to serve at-risk workers.

[6]H.R. Rep. No. 116-450, at 22 (2020).

[7]Unless otherwise noted, the word “stakeholders” refers to anyone or any group we interviewed, including state and local workforce boards, academics, and representatives of other organizations. In addition to individual interviews, we interviewed a number of stakeholders in group settings, and not all stakeholders offered thoughts on every question. As used in the report, the term “several” indicates that three to four stakeholders gave a particular response, while the term “many” indicates that five or more stakeholders gave a particular response. We also sometimes refer to the number of states represented by stakeholders to provide another sense of breadth for the comments.

[8]We obtained information from several local workforce boards recommended to us by state workforce board representatives as having particularly noteworthy programs.

Additionally, we interviewed stakeholders, including officials from DOL and the Census Bureau, as well as nine other organizations, such as national organizations of state workforce boards and agencies, business, labor, industry, and academic organizations, to obtain their perspectives on skills needed for in-demand jobs and the challenges workers face in obtaining those jobs. We selected these stakeholders based on our prior work on automation and workforce issues, as well as additional suggestions from initial outreach. The views of the stakeholders we interviewed provide illustrative examples on these topics and are not generalizable.

We also reviewed prior GAO reports and other literature to understand skills required for in-demand jobs; programs that provide workers with in-demand skills; challenges to obtaining in-demand jobs; and any lessons to consider as agencies respond to changes in the labor market due to automation. For additional information about our methodology, see appendix I.

We conducted this performance audit from April 2021 to August 2022 in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

Background

The Changing Composition of Jobs and Skills as a Result of Automation

Historically, new technologies have enhanced productivity and improved societal standards of living. Many workplace technologies have been designed to save labor through automation. However, as automation has replaced tasks performed by some types of workers, it has also created a greater demand for other types of workers.

Automation continues to affect the workforce landscape, as advanced technologies change the composition of jobs and skills demanded by employers. In March 2019, we found that technology adoption is likely to lead to increased demand for certain types of jobs, while reducing

demand for other jobs—both in the short and long term.[9] That report also noted that multiple tasks comprise a job and multiple jobs comprise an occupation. If automation simplifies a few tasks, for example, it will change the nature of the job and perhaps allow a worker to take on more or different tasks. Likewise, if automation replaces some tasks, the skills needed to perform those tasks might also become unnecessary and could lead to declines in the number of jobs requiring those skills.[10] If automation eliminates enough tasks in a given job, the job might be eliminated. Finally, if enough of those jobs are eliminated, the occupation consisting of those jobs might also be eliminated. For example, one study noted that an occupation that features basic use of numbers, such as a cashier, might be replaced with self-checkout machines, leading to decreased demand for that occupation. In addition, workers with lower levels of education who perform more routine tasks have tended to experience the greatest disruptions from automation, putting workers such as cashiers or clerical workers at risk.

On the other hand, where automation requires new skills, such as monitoring an automated process, it can lead to a skills gap in the labor market, with employers unable to find enough workers with the new skills needed. Several studies have attempted analyses of the skills gap in the labor market. For example, a 2018 study concluded that the skills gap had widened, and estimated that the gap could account for approximately 2.4 million skilled manufacturing job vacancies from 2018 through 2028.[11] In the same study, surveyed manufacturers cited a “shifting skill set due to the introduction of new advanced technology and automation” as the greatest cause of their skills shortage.[12] Another study that analyzed the skills associated with job openings noted similar dynamics, stating that technological advancement has caused the skills required for common job postings to change up to 40 percent in the last decade.[13] Other

[9]GAO, *Workforce Automation: Better Data Needed to Assess and Plan for Effects of Advanced Technologies on Jobs*, GAO-19-257 (Washington, D.C.: Mar. 7, 2019).

[10]The Occupational Information Network (O*NET) defines skills as “the ability to perform a task well,” and notes that skills are “usually developed over time through training or experience.”

[11]Giffi et al., *2018 Deloitte and The Manufacturing Institute Skills Gap*.

[12]Giffi et al., *2018 Deloitte and The Manufacturing Institute Skills Gap*.

[13]Burning Glass Technologies, *After the Storm*.

research noted that the current speed of change can leave large segments of the population with obsolete skills.[14]

Federal and Other Data on Jobs and Skills

To help understand workforce changes, including job trends and skills needed for specific occupations, DOL provides data on the workforce. For example, DOL's Bureau of Labor Statistics (BLS) publishes annual, 10-year employment projections for the U.S. These projections analyze changes in the economy, among other things, to predict how employment levels across about 800 occupations may change during the next 10 years. The projections incorporate factors that can affect occupational employment. These include how automation might limit employment demand in the manufacturing sector (as machines perform more tasks that human workers previously did), or how automation might reduce demand for administrative support occupations (as new software programs automate administrative tasks).

For skills needed for specific occupations, DOL's Employment and Training Administration oversees the Occupational Information Network (O*NET). O*NET collects data on skills needed for occupations, including the degree of importance of a particular skill for a given occupation.[15] O*NET groups 35 skills into seven categories: content; process; complex problem solving; resource management; social; systems; and technical.[16] O*NET organizes the information about occupations in a similar way to the BLS employment projections, which allows job projections information to be matched with occupational skill information. This matching can identify skills needed for in-demand occupations.

In addition to DOL's data efforts, the Census Bureau also collects data on automation. As we noted in March 2019, the Census Bureau has long measured the impact of technology, and obtains information through

[14]Melanie Arntz, Terry Gregory, and Ulrich Zierahn, "The Risk of Automation for Jobs in OECD Countries: A Comparative Analysis," *OECD Social, Employment and Migration Working Papers*, no. 189 (Paris: OECD Publishing, 2016).

[15]O*NET is sponsored by the Employment and Training Administration through a grant to the North Carolina Department of Commerce, according to DOL. O*NET also collects information on knowledge and abilities, as well as more specific job tasks. O*NET has a 5-point scale of importance for its 35 skills, with ratings ranging from "Not Important" (1) to "Extremely Important" (5). See appendix I for additional information on O*NET.

[16]O*NET groups content and process skills together as "basic" skills, and refers to the other five skill categories as "cross-functional" skills. See appendix I for additional information.

surveys such as its Annual Business Survey.[17] The Census Bureau also collects capital expenditure data on industrial robotics in the Annual Survey of Manufactures and on industrial, as well as service, robotics in the Annual Capital Expenditures Survey.[18]

Beyond federal efforts, states capture data related to labor market conditions and projections, as well as the demand for particular skills and occupations in their respective geographic areas. States and employers can use this information to help plan for their area's future workforce needs, including those for in-demand jobs.

Workforce System and Training Programs

State and local workforce development boards—key components of the workforce system that include representatives from area businesses, labor organizations, government, and training providers, among others—help direct employment and training in their respective geographic areas. The boards coordinate between DOL and local American Job Centers to optimize services for jobseekers and employers.[19]

Training programs, also known as workforce development programs, seek to provide participants with education and training to prepare them for work and help them improve their prospects in the labor market. Programs may focus on some combination of job-search assistance, career counseling, occupational skill training, classroom training, or on-the-job training. While training programs may support individuals who are unemployed with the goal of facilitating reentry into the job market, programs may also provide skills to already employed individuals, also known as incumbent workers. Incumbent worker training can have several benefits: it can help workers gain skills needed to maintain

[17]GAO-19-257.

[18]According to Census Bureau officials, these surveys do not directly make inferences about the impact of automation on work, but do produce experimental statistics on the share of workers at establishments (or firms) with robotics, a measure of exposure to automation technologies, including robotics. Officials also noted that agency efforts at collecting data on advanced technology have not been continuous, but have more recently been restarted.

[19]GAO, *Economic Adjustment Assistance: Experts' Proposed Reform Options to Better Serve Workers Experiencing Economic Disruption*, GAO-21-324 (Washington, D.C.: Apr. 19, 2021).

employment, avert layoffs, and promote development of skills to help workers progress in their careers.[20]

Within the workforce system, training programs can use a variety of methods. Some programs offer training that results in a credential or certificate to signal the skills participants have mastered. The Workforce Innovation and Opportunity Act (WIOA) affirms the importance of effective credentialing by stating that one of the purposes of the act is to provide workforce investment activities, through statewide and local workforce development systems, that increase participants' attainment of recognized postsecondary credentials.[21] Other programs are centered on a "career pathways" approach—a workforce strategy designed to bolster long-term earnings and self-sufficiency for workers by combining high-quality education, training, and other services to support participants' success. As part of this strategy, workers would have multiple opportunities to enter and exit training and jobs in a specific industry.[22] This can mean encouraging workers to find new jobs in "adjacent" careers that require similar skills or tasks to their previous jobs.[23] Programs can also help participants not just by teaching skills, but by providing "wraparound" services—comprehensive supports such as basic education, and supportive services such as childcare support or transportation—that enable participants to concentrate on their learning.[24]

[20]GAO-21-324.

[21]29 U.S.C. § 3101(6).

[22]ABT Associates, *Building Better Pathways: An Analysis of Career Trajectories and Occupational Transitions* (Rockville, MD: Dec. 2021). This study, funded by and prepared for DOL, noted that the career pathways approach has four main tenets: (1) offers multiple places to enter and exit training and jobs in a specific industry; (2) results in recognized credentials intended to lead to better jobs with higher pay; (3) uses support services and flexibility for nontraditional students; and (4) relies on employer partnerships.

[24]GAO-21-324.

Available Data Do Not Explicitly Identify Workers at Risk of Losing Their Jobs to Automation, but Indicate Skills Needed for In-Demand Jobs

Federal and other data do not explicitly identify U.S. workers who are at risk of losing their jobs to automation, and recent estimates attempting to identify the number of workers affected have varied widely. DOL and the Census Bureau are seeking additional data on skills that the general worker population will need for in-demand jobs in light of automation. Currently available federal data show that in-demand jobs require workers to have a mix of skills, including soft skills; process skills that help a person acquire knowledge quickly (e.g., active learning and critical thinking); and technical expertise (e.g., equipment maintenance).[25] The data also indicate that the number of skills required for in-demand jobs increases with education and pay level. Further, research indicates that certain jobs and skills are less likely to be automated. In addition, in some states, state, local, and private data are used to inform which skills are most important for in-demand jobs in a given geographic area.[26]

Federal Data and Other Research Do Not Explicitly Identify At-Risk Workers, and Agencies Are Seeking Additional Information on Automation's Workforce Effects

Existing federal data do not explicitly identify, or provide detailed occupational characteristics about, workers that are most at risk for job loss. DOL officials noted that one of the primary challenges of collecting information on at-risk workers is accurately identifying who is at risk. Further, officials said any additional agency efforts would require significant resources and yield uncertain results. Officials also noted the large degree of uncertainty in academic estimates on the effects of automation on employment.[27] Our prior work corroborates this perspective. For example, in 2019 we found that academic research quotes anywhere from 9 to 47 percent or more of the workforce could hold jobs at risk of being automated. Additionally, we noted that workforce data do not identify the causes of employment shifts; so even for workers who have actually lost jobs, the data do not specify whether automation was the cause.[28]

[25]O*NET defines soft skills as interpersonal and thinking skills needed to interact successfully with people and to perform efficiently and effectively in the workplace.

[26]Descriptions and terms for skills vary across data sources such as O*NET or private research, making it difficult to directly compare different research studies' conclusions about specific skills required for in-demand jobs.

[27]DOL officials said that the agency is tracking a range of studies that use different datasets and methodological approaches to assessing automation's effect on the workforce.

[28]As noted in GAO-19-257, federal data do not provide a comprehensive picture of the causes of employment shifts or the skills needed for in-demand jobs.

Moreover, DOL officials noted that some occupations may be considered at risk of automation and yet still be projected to grow. For example, DOL officials noted that the number of truck driving jobs is projected to grow by about 3 percent from 2019 through 2029, but studies have also predicted those jobs are among the most at risk of automation further in the future.[29] DOL does not currently—and has no plans to—produce any public statistics on particular occupations' vulnerability to automation, due to the uncertainty and complications of creating such data.[30]

Like DOL, the Census Bureau collects data on the impact of automation on the workforce, but does not specifically identify at-risk workers. The Census Bureau's efforts include the Annual Business Survey, which Census Bureau officials said collected qualitative data at a high level and did not identify the subset of workers impacted by automation. Officials said other Census Bureau efforts likewise did not identify at-risk workers.[31]

DOL and the Census Bureau are expanding their efforts to collect and analyze data on skills needed by the workforce in light of automation. For example, BLS officials said they plan to conduct case studies of employers to examine how automation is affecting jobs and to inform potential future data collection efforts on automation. The agency plans to focus the studies on three sectors: retail trade, health care, and transportation and warehousing.[32] Additionally, in fiscal year 2020, DOL submitted a study to Congress on ways to supplement DOL data collection to understand the impact of changing technology on the

[29]See, for example, GAO, *Automated Trucking: Federal Agencies Should Take Additional Steps to Prepare for Potential Workforce Effects*, GAO-19-161 (Washington, D.C.: Mar. 7, 2019), which noted that widespread use of self-driving trucks was still years to decades away.

[30]As noted earlier, although BLS does not produce these statistics, BLS nonetheless incorporates technological impacts—such as automation—into its employment projections. Those projections examine automation along with other factors, such as changes in consumer preferences, demographic changes, and outsourcing, according to BLS officials. BLS's Occupational Outlook Handbook discusses automation for occupations when the BLS research concludes that automation has a significant impact on the expected future number of workers in an occupation.

[31]Census Bureau officials noted that they have an ongoing effort with BLS to combine establishment level data with worker skill data from O*NET.

[32]BLS officials said they plan to prioritize advanced technologies with the largest effects on jobs, and will review automation that is part of each sector's production. They anticipate publishing findings from the case studies in 2023.

workforce.[33] That study identified additional data needed on the demand for skills, including soft skills such as collaboration and more technical proficiencies such as coding. BLS has created working groups to evaluate the study's recommendations and plan next steps. DOL officials also said they are evaluating additional ways to collect data through surveys to further identify automation's effects on worker skills.

Likewise, researchers from the Census Bureau and others analyzed the 2019 Annual Business Survey data, which asked companies about their employment outcomes attributable specifically to adopted advanced technologies.[34] Among other findings, preliminary analysis showed the following:

- Most respondents—about 75 percent—reported no employment change attributable to technology, and of the respondents reporting change, more reported employment increases than decreases.[35]
- About half of respondents reported changes in skill levels due to adoption of technology, and, of those, firms generally reported that adopting technology resulted in increasing firms' demand for skills.
- Respondents that reported greater adoption of new technologies (e.g., high degree of use for robotics or specialized equipment) were more likely to report a greater increase in the skills needed to work at the respondent's company.

The Census Bureau is continuing to validate the results of the 2019 Annual Business Survey, and plans to release a final paper in September

[33]This study, among other efforts, helped DOL implement our recommendation to gather additional data on automation's effect on the workforce. See Gallup, *Assessing the Impact of New Technologies on the Labor Market: Key Constructs, Gaps, and Data Collection Strategies for the Bureau of Labor Statistics* (Omaha, NE: Feb. 7, 2020). DOL has also studied the feasibility of using its O*NET system to track changes in occupations over time and concluded that it was not feasible. DOL is also monitoring additional studies to assess the effects of automation.

[34]The Census Bureau specifically asked firms about the adoption of five technologies: artificial intelligence, cloud computing, dedicated equipment, robotics, and specialized software.

[35]Census Bureau officials noted that firms that reported greater use of robotics were just as likely or more to report a decrease in employment as to report an increase (conditional on a change in employment in either direction).

2022. Currently, the Census Bureau plans to repeat the workforce related questions in the 2023 Annual Business Survey.[36]

Data Indicate That In-Demand Occupations with More Skills May Require More Education and Offer Higher Pay, and Research Suggests These Jobs Are Less Likely to Be Automated

We analyzed BLS employment projections for the period 2019 to 2029 and 2020 O*NET skills data and found that in-demand occupations with more "important" skills (as indicated by O*NET) tend to require higher levels of education and offer greater pay.[37] Specifically, from the set of occupations with above-average changes in employment levels, we analyzed O*NET data on skills for the 20 fastest-growing occupations overall—regardless of education level—and also for the top 20 fastest-growing occupations according to three education levels needed for them:

- a high school degree or less;[38]
- some college;[39] or
- a bachelor's degree or higher.[40]

We found that in-demand occupations at every education level share many "important" skills. Further, as the education requirement increases,

[36]In addition, the Census Bureau plans to collect data on technology adoption through its Economic Census in 2022, but no questions on worker effects will be included, according to agency officials. The Economic Census collects data on businesses and economic impact every 5 years.

[37]O*NET uses a 5-point "importance scale" to quantify the importance of a particular skill to a particular occupation (such as the importance of the skill of speaking to the occupation of nursing). In this report, we used O*NET's average score of 3 or above to identify a skill as "important." Projections about future job growth and skills needed have limited certainty, as with any projections, and are subject to error because of the many unknown factors that may affect the economy over the projection period. Moreover, our analysis is at the national level, and the set of jobs projected to grow and the skills needed for them might differ across localities. For example, even if an occupation is projected to grow at the national level it does not mean that it will be growing in all localities. Additionally, given that these are national-level data, the characteristics of the selected occupations, such as median wages, might differ across localities. For additional information about O*NET and our analyses, see appendix I.

[38]We defined occupations needing "a high school degree or less" as those occupations with a typical entry-level education, based on BLS's projections data, of "high school diploma or equivalent" or "no formal educational credential."

[39]We defined occupations needing "some college" as those occupations with a typical entry-level education, based on BLS's projections data, of "associate's degree" or "postsecondary nondegree award" or "some college, no degree."

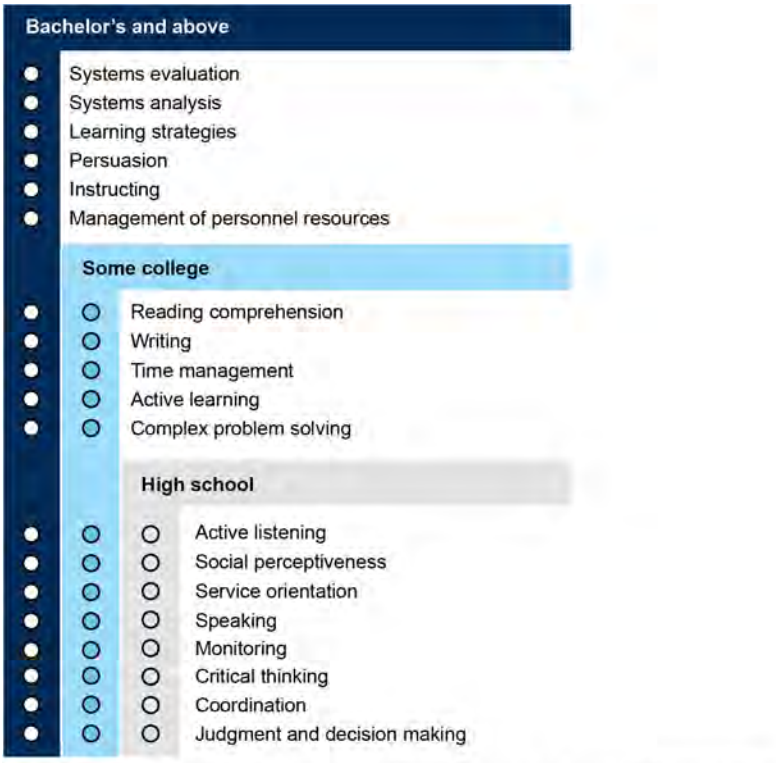
[40]We defined occupations needing "a bachelor's degree or higher" as those occupations with a typical entry-level education, based on BLS's projections data, of "bachelor's degree" or "doctoral or professional degree" or "master's degree."

so does the number of “important” skills.[41] Specifically, in-demand occupations across all education levels share eight “important” skills—including critical thinking and service orientation. Occupations requiring at least some college or a bachelor’s degree or higher have an additional five skills in common.[42] Similarly, we found that skills for occupations requiring a bachelor’s degree or higher have six additional “important” skills that were not associated with skills listed for the other two levels of education, as shown in figure 1.

[41]In addition, we regressed the total number of skills deemed important for each occupation on the education level and found a positive and statistically significant relationship in the sample of our top 20 jobs as well as in the overall dataset. This relationship represents a correlation, and we did not control for other factors. Thus, it could be driven by factors related to both the total number of skills deemed important and to the education level. For a full list of occupations and skills, see appendix I.

[42]In order to identify the skills deemed important for each education group, for each skill in that group we calculated the weighted average importance score (weighted by 2019 employment) and selected the skills with a weighted average importance score of 3 or above. While our analysis of O*NET data identifies skills required for the top 20 in-demand occupations collectively, those data also include skills unique to each in-demand occupation. For example, among our top 20 in-demand occupations where the typical education needed for entry is high school or less, “equipment selection” is a skill deemed important only for the occupation of industrial machinery mechanic. Likewise, “installation” is a skill deemed important only for solar photovoltaic installers. For the list of weighted average importance scores for each education group, see appendix I.

Figure 1: Skills Deemed Important in the Top 20 In-Demand Occupations, by Education Level



Source: GAO analysis of U.S. Bureau of Labor Statistics (BLS) Employment Projections program data and U.S. Department of Labor Occupational Information Network (O*NET) data. | GAO-22-105159

Notes: We restricted our study of the fastest-growing, "in-demand" jobs to those occupations that were projected to gain an above-average number of jobs in the 2019-2029 period for each of the three education groups. Then, using O*NET's skills and "importance scores," we identified the most important skills for the 20 fastest-growing occupations by calculating the weighted average importance score (weighted by 2019 employment) and selecting the skills with a weighted average importance score of 3 or above for each education level. For additional information on how O*NET describes skills, see: basic skills and cross-functional skills.

The number of skills deemed important in each education category were similar for in-demand occupations and all other occupations. (See table 1.)

Table 1: Number of Skills Deemed Important by Occupational Information Network (O*NET) Data, According to Education Level Required for Occupations

Education level	Number of "important" skills for in-demand occupations	Number of "important" skills for other occupations
High school or less	8	9
Some college	13	13
Bachelor's degree or more	19	20

Source: GAO analysis of U.S. Bureau of Labor Statistics (BLS) Employment Projections (EP) program data and U.S. Department of Labor Occupational Information Network (O*NET) data. | GAO-22-105159

Notes: We identified in-demand occupations as those occupations that were projected to gain an above-average number of jobs during the 2019–2029 period for each of the three education groups, and then chose the 20 fastest growing occupations for each education group. We also identified occupations outside of the top 20 in-demand occupations in the relevant education group. For each category, in order to determine if one of O*NET's 35 skills was deemed important for a particular education level, we first calculated the weighted average importance score (weighted by 2019 employment) for the top 20 in-demand occupations and for the occupations outside of the 20 in-demand occupations in that education group and selected the skills with a weighted average importance score of 3 or above. O*NET uses a 5-point "importance scale" to quantify the importance of a particular skill to a particular occupation (such as the importance of the skill of speaking to the occupation of nursing). We used O*NET's average score of 3 or above to identify a skill as "important."

In addition, in-demand jobs that require a greater number of "important" skills also have higher average pay, according to our analysis of BLS and O*NET data. For example, those top-20 overall in-demand jobs in the highest quartile—with median pay of nearly $110,000—have about 18 skills deemed important, while jobs in the lowest quartile—with median pay of about $30,000—have about eight skills deemed important.[43]

Research suggests that many of the skills needed for in-demand occupations at the higher levels of education—including more abstract skills and those involving judgment and adaptability—might protect individuals from the effects of automation. For example, one study noted that the skills most vulnerable to automation are routine cognitive and physical skills, such as operating machinery or collecting and processing data, while the least vulnerable are skills such as creativity, social skills,

[43]We divided our top 20 in-demand occupations into quartiles based on median wage data (in 2020 dollars) from BLS's Occupational Employment and Wage Statistics program. We also regressed the total number of "important" skills on median annual wages and found a positive and statistically significant relationship in the sample of our top 20 jobs, as well as in the overall dataset. This relationship represents a correlation, and we did not control for other factors. Thus, it could be driven by factors related to the total number of skills deemed important and to wages.

management, and planning.[44] That study noted that nursing and home health support are good examples of occupations with tasks that are difficult to automate because they involve high levels of social and emotional interaction. Those occupations are growing and were included in our analysis of in-demand occupations.[45]

O*NET Has additional Resources for Individual Job Seekers

O*NET has additional information on jobs and the skills required for them. For example, O*NET lists "Bright Outlook" occupations, which, like in-demand jobs, are projected to grow faster than average or to have more than 100,000 openings over a 10-year period, nationally. For each occupation, O*NET provides detailed information, including particular tasks common to the occupation; skills ranked by importance; and specific technology skills such as cloud-based software or spreadsheet skills. For example, for home health aides, O*NET details 11 common tasks such as maintaining records of patient care and checking patients' pulse and temperature. O*NET also lists active listening, service orientation, and social perceptiveness as the top three most important skills for those aides. DOL officials noted that American Job Center staff work with job seekers to identify their skills and abilities, and advise them on in-demand jobs and potential training opportunities available in their local areas based on local labor market information.

Source: GAO analysis of Occupational Information Network (O*NET) data and Department of Labor interviews. | GAO-22-105159

Other studies have suggested that paths for obtaining new skills might help with performing new jobs in the future. For example, one study stated that workers have found some success in meeting changing job demands by acquiring new skills through formal educational attainment, such as obtaining a bachelor's or associate's degree.[46] That study noted that new and emerging jobs may have a high demand for analytical skills. Another study stated that formal educational attainment will not be the only path, noting that automation will also create other jobs that do not require a college degree, such as robotics technicians.[47]

Workers who acquire additional skills may be able to leverage those skills to obtain jobs that offer higher pay. For example, one report observed that a retail worker could acquire some basic computer skills to become a "help desk" specialist.[48] Another study stated that workers at risk of automation could, with reskilling, expand their career options and increase their income.[49] Moreover, without reskilling, a quarter of at-risk workers could see their income drop, according to the same study.

[44]See Conor McKay, Ethan Pollack, and Alastair Fitzpayne, *Automation and a Changing Economy, Part I: The Case for Action* (Washington, D.C.: Aspen Institute, April 2019).

[45]For example, nurse practitioners, occupational therapy assistants, home health and personal care aides, and physical therapy assistants all made the list of top 20 in-demand occupations. See appendix I for the complete list.

[48]Burning Glass Technologies, *After the Storm*.

[49]The Boston Consulting Group, *Towards a Reskilling Revolution: A Future of Jobs for All* (Geneva: World Economic Forum, January 2018)

Likewise, one group of researchers noted that occupations requiring intellectual knowledge, skills, and abilities yield the highest pay.[50]

State Data and Other Research Provide Additional Information on Skills Needed for In-Demand Jobs in Specific Geographic Areas

States Have Flexibility to Identify In-Demand Jobs

States can identify in-demand jobs in different ways, including taking into account factors such as predicted job growth, wages, stability, and future outlook. For example, all of our case study states incorporated projected job growth rates and job openings to determine their in-demand jobs. In addition, California, Pennsylvania, and Washington analyzed supply and demand to determine their in-demand jobs, while California, Kentucky, and Pennsylvania included wages and education levels as part of their determinations.

Source: Department of Labor data and interviews. | GAO-22-105159

Stakeholders we interviewed in our case study states said that many state and other entities—such as governments, business organizations, training providers, unions, and private companies—collect data on the in-demand jobs and skills needed in their specific geographic areas.

State governments. State governments collect data on in-demand jobs and skills needed in their states and, according to DOL, are able to do so because of the nationwide workforce and labor market information system that is authorized and funded under the Wagner-Peyser Act as amended by the Workforce Innovation and Opportunity Act (WIOA).[51] In addition, states must include an analysis of economic conditions in their state as part of their WIOA state plan.[52] Each of our case study states maintains data online that provide information on occupational projections within their states, as well as skills and training or education needed for specific occupations. For example, California publishes data by occupation at a regional level, along with an interactive tool that shows occupational profiles of job skills needed and training requirements for high-growth occupations, which officials said workers could use to identify “adjacent” jobs that can build on skills a worker already has. Likewise, Washington maintains data on in-demand occupations by county, as well as employment projections, pay, and skills information. Washington officials noted that the local workforce development boards finalize the lists of in-demand jobs in their regions. For skills information in particular, Washington uses private data to identify skills from online announcements. Kentucky has created a workforce dashboard showing 5-year projected job growth by region, wage estimates, and skills self-assessments for all occupations collectively or specific occupations. The dashboard can present information on occupations by education, experience level, growth, and typical on-the-job training, among other

[50]Anthony P. Carnevale, Megan L. Fasules, and Kathryn Peltier Campbell, *Workplace Basics: The Competencies Employers Want 2020*.

[51]See 29 U.S.C. § 49l-(2).

[52]See 29 U.S.C. § 3112(b)(1)(A). In order for states to be eligible for WIOA funding for adult and dislocated worker employment and training activities, states must submit a unified state plan outlining a 4-year strategy for the core programs defined under the act. 29 U.S.C. § 3112(a). See also 34 C.F.R. § 361.105. The determination of whether an industry sector or occupation is in-demand for purposes of WIOA is made by the state board or local board, as appropriate, using state and regional business and labor market projections, including the use of labor market information. 29 U.S.C. § 3102(23)(B).

characteristics. Pennsylvania officials said their state labor department uses data from research organizations within the state to obtain information pertaining specifically to workers at risk of losing their jobs to automation.

Business organizations. Business organization representatives on state boards said they took various approaches regarding collecting information on skills needed for in-demand jobs, as well as information on the effects of automation. For example, officials from a business organization in one state said it tracks jobs that could be lost to automation, and reports these data to the governor's office during monthly meetings. The organization collects information from thousands of businesses in its region through questionnaires and calls, and asks questions such as whether jobs at the business will exist in 5 years or if the company is considering automating jobs. The officials said they research potential trainings that could support workers whose jobs may soon be automated. In contrast to collecting their own data, an official representing businesses on another state workforce board said that their association relies on outside sources for data and worked closely with a local economist to study automation in their state. The study found, among other things, that automation is creating new tasks for workers to perform, which may require specific training. Similarly, business representatives in another state said that their state used a public-private partnership to collect data from businesses and employers to report on jobs in high demand.

Training providers. Training providers in our selected states presented a range of data collection efforts, from collecting data themselves on skills needed for in-demand jobs to relying on outside information. One training provider, for instance, said it gathers data on projected automation, digital skills, and job openings and shortages. Specifically, the provider said it examined the degree to which tasks within certain health care jobs are likely to be automated, and found that from 30 to 60 percent of those tasks are likely to be automated. The study also found that the percentage of tasks subject to automation decreases as a worker moves further up the career ladder. Another training provider said it collects data on in-demand jobs and skills by surveying industry partners, as well as reviewing projected retirement data and state community college data. One training provider noted that it relies significantly on state and regional workforce development board data, as well as private data, which the provider uses to identify demand for training.

Unions. Union representatives in two case study states said that they collect workforce information. Of those, one representative said that their

union's apprenticeship program collects information from its contractors to determine the demand for its programs, while the other said that their union provides labor demand data to state officials. Separately, a union representative in another case study state said that their organization does not collect data, and instead relies on the state's employment data.

Private data. Some companies collect workforce data such as skills for in-demand jobs, credentials, and training needs. These companies can obtain the data from job postings and other data, which can provide more insight than federal data alone.[53] For example, these data

- provide skills data that are more up to date than O*NET because the job postings are current. This allows private data collection companies to readily observe workforce effects of current events, such as the COVID-19 pandemic. One such company published the trends it saw in jobs and skills coming out of the pandemic, including a greater push toward automation.[54] A company representative also said that O*NET job data can be slow to identify emerging trends; the representative noted that, for example, "data scientist" was added to the O*NET jobs list in 2018, despite being an identifiable occupation for a decade prior to then.[55]
- identify more specific skills than O*NET's set of 35 skills because job postings have more specific requirements. For example, skills could include mastery of specific software or familiarity with social media platforms. However, O*NET also uses private data to compile and update a list of "Technology Skills," which identify the general skill (e.g., "spreadsheet software"), as well as the specific software technology. O*NET lists these skills on its website by occupation.

[53]A representative from one company, for instance, testified to Congress that it monitors nearly 50,000 job sites daily and at any given time tracks over 3 million current job openings. The representative said that the company's database holds more than a billion current and historical job postings, which allows the company to identify trends and see changes in the market quickly.

[54]See Burning Glass Technologies, *After the Storm*.

[55]DOL officials noted that O*NET purchases job postings data from a private company and uses the data, in part, to identify alternate job titles. These alternate job titles are associated with O*NET occupations and used to make the online keyword searches more effective for users who search on job titles, rather than by federal occupational codes. However, DOL officials also said that O*NET skills and other data are generally updated every 5 years, and it is unfeasible to track changes in occupational skill requirements over time.

- could help job seekers identify possible ways to build on existing skills to obtain a job that might be less subject to automation.
- can identify in-demand skills for specific geographic areas.

However, two stakeholders cited concerns about relying too heavily on private data to identify skills important for in-demand jobs. One stakeholder noted, for example, that the universe of online job postings is more heavily weighted toward professional occupations in large companies and consequently may not feature occupations that are projected to have many job openings over the next decade, such as food service. Both stakeholders said that the postings may not contain the skills typically required for the occupation. For example, job postings are often quite short, the stakeholders said, so they do not describe the majority of skills needed for the job. One stakeholder also said that the process of translating the job posting text to data can yield unreliable results.

Selected Stakeholders Suggested Workforce Programs Could Better Serve Displaced Workers by Refining Content and Increasing Accessibility and Investment

Stakeholders we interviewed offered insights on how existing workforce programs could better serve displaced workers who face challenges to getting in-demand jobs, and those at risk of losing their jobs to automation. Specifically, stakeholders proposed focusing training content on in-demand skills, designing programs to maximize their accessibility, incentivizing additional training opportunities, and collaborating with other workforce stakeholders to enrich the training landscape, among other potential steps, to better serve workers displaced by automation.

State Workforce Officials Cited a Few Examples of Training Programs Serving At-Risk Workers

While selected state workforce board representatives cited very few programs that targeted workers at risk of losing their jobs to automation, some efforts do exist. In Kentucky, for example, the National Dislocated Worker Grants program was used to fund employment and training services for approximately 200 displaced workers when their plant relocated due to automation. One plant worker, facing a potential layoff after 34 years, said he found new employment as a controls engineer after completing a 12-week training program. Another worker used career services and training to eventually earn a commercial driver's license, according to Kentucky workforce officials.

In addition, California workforce board officials said that an agricultural company in California automated its manual fruit-packing processes. The company sponsored in-house training to retain about 90 percent of their affected employees, who learned how to operate, clean, and maintain the new machinery.

Training Program Content That Includes Aligning Existing and In-Demand Skills May Help Workers Obtain In-Demand Jobs

Characteristics of Workers at Risk of Automation May Differ from General Population

Previous GAO work has found that the characteristics of workers in jobs at risk of automation may differ from those of the workforce generally. For example, at-risk workers earn less, on average, and have on average fewer years of education. Other research has observed similar dynamics, noting for example that rural workers are more likely to be negatively impacted by automation. This research has suggested that training programs centered on at-risk workers should consider how the program can respond to the particular skills, needs, and characteristics of this population.

Source: GAO, Workforce Automation: Better Data Needed to Assess and Plan for Effects of Advanced Technologies on Jobs, GAO-19-257 (Washington, D.C.: Mar. 7, 2019) and GAO analysis of National Governors Association Center for Best Practices, Future Workforce Now: Reimagining Workforce Policy in the Age of Disruption (Washington, D.C.: July 2020). | GAO-22-105159

According to many stakeholders, providing in-demand skills training could help workers overcome some of the challenges they face in obtaining in-demand jobs. For example, stakeholders in three states said one challenge is that training program content does not always focus on in-demand skills. One state official said that some programs focus on interviewing and resume writing skills, rather than helping workers acquire the actual skills needed to do the tasks for their next jobs. Two other stakeholders noted that workforce programs tend to focus on getting workers new jobs quickly, rather than finding jobs that could provide a longer career or work that is less susceptible to automation. Several stakeholders reported that, as a result, such programs can lead to short-term or low-wage jobs while doing little to promote entry into jobs that provide satisfactory levels of stability and wages.[56] For example, one stakeholder mentioned a program that taught participants to operate a cash register, which, upon program completion, would likely lead to a low-wage job that the stakeholder did not believe provided enough financial stability.

A second challenge, mentioned by state board stakeholders across all four states, is that workers may struggle psychologically to accept reskilling programs or new jobs. For example, one stakeholder said that job loss can be traumatic for many workers, while another said training programs that do not adequately consider workers' psychological barriers can limit opportunities to obtain in-demand jobs. According to state board stakeholders in two states, workers may not be able to envision how their skills can translate to another occupation because they have been doing the same job the same way for many years.

Lastly, two stakeholders suggested that some training programs that do not result in an industry-recognized credential hinder access to in-demand jobs. When workers do not have a recognizable credential, or when skills associated with a credential are unclear, employers may be unsure whether workers have obtained skills relevant to their job openings. Likewise, one stakeholder noted that even when credentials are provided, workers may not understand which ones are valuable to employers. Consequently, workers may not understand which training programs are most useful for obtaining in-demand jobs.

[56]According to DOL officials, states can consider stability and pay as part of the requirements for the definitions of in-demand jobs in their states.

Stakeholders offered various approaches to mitigate some of these challenges. Stakeholders and research noted that workforce organizations can adjust program curriculum in several ways to help workers obtain in-demand jobs. For example, workforce officials in one state noted the importance of teaching skills that lead to jobs that are less likely to be automated, while officials from another state said that training should help workers obtain "higher-level" skills in order to compete in the labor market; as we noted earlier, these skills may be less likely to be automated. Another state's workforce officials suggested that workforce programs should train workers for high-growth, good quality jobs by emphasizing skills needed to perform jobs that will be automation resistant. Additionally, one labor representative stated that while training often focuses on resume writing and interviewing, training would be more useful if it identified which occupations each worker should pursue and relevant skills for that occupation.

Another strategy, suggested by two studies, emphasizes building upon existing skills to move employees to "adjacent" jobs quickly.[57] State board stakeholders in two states echoed this; one state board stakeholder who represented employers said that long-haul truckers whose jobs are at risk of automation could apply skills from that job to other trucking-related positions such as monitoring vehicles for an emergency call center tracking those vehicles. The stakeholder noted the importance of workers believing their skills will be transferrable, suggesting that transitioning to new jobs that rely on already mastered skills may alleviate psychological barriers.

A 2021 report funded by DOL includes similar insights. It suggests focusing training on occupations that are likely to lead to wage growth for workers. Accordingly, the report intends to help training providers design programs that focus on "career pathways" by providing information on career trajectories and occupational transitions (such as which occupations are associated with higher-than-average wage growth for job entrants over time). The report also suggested that programs should not focus solely on a narrow range of highly specialized skills.[58] Instead, it recommended teaching skills such as problem solving and

[57]Burning Glass Technologies, *After the Storm;* and McKinsey Global Institute, *The Future of Work in America* (Washington, D.C.: July 2019).

[58]DOL officials noted that programs focusing on a narrow range of highly specialized skills may still be highly desirable for certain occupations or industries, such as health care.

communication, which are associated with occupations with strong wage growth and are also transferrable to a variety of industries and occupations.[59]

Washington's "Upskill Backfill" Initiative Provides Advanced-Skill Training

Washington stakeholders cited the Upskill Backfill initiative as a potentially useful model to train workers impacted by automation, though the initiative has not served these specific workers to date. One such training sought to upskill welders and machinists for supervisory roles by advancing both technical and "soft" skills, such as communication and teamwork. At the end of the program, 255 people completed training and 28 people were promoted. While technical skills were considered important, the workforce board attributed the promotions to the soft-skills training.

Source: Washington Workforce Training and Education Coordinating Board documentation and interviews with state workforce board officials. | GAO-22-105159

Additionally, one study advised that training programs be designed to lead to widely recognized credentials that signal mastery of in-demand skills. For instance, the study highlighted one state that provides programs that result in recognized certificates, like a welding certificate from a community college. This state is also developing a way to track relevant data to signal the credentials job applicants carry.[60] Another state's governor signed an executive order requiring the state to recommend ways to create more transparency for credentials conferred by public higher education institutions by translating them wherever possible into skills and competencies. Similarly, workforce experts we interviewed for our April 2021 report suggested providing workers with information on the quality of credentials and how credentials can be combined to help career progression.[61] Moreover, another study of four sector-based training programs noted that training programs that focused on occupational skills leading to an industry-recognized credential, as well

[59]ABT Associates, *Building Better Pathways: An Analysis of Career Trajectories and Occupational Transitions* (Rockville, MD: Dec. 2021).

[61]GAO-21-324.

as targeting high-wage sectors, among other characteristics, produced the largest and most persistent wage gains.[62]

Finally, some workforce stakeholders have taken steps to define or broaden understandings of which credentials provide meaningful skills for in-demand jobs. For example, a state board stakeholder representing training providers stated that the community college system can be leveraged to provide many workers with credentials a variety of employers understand and value. Another stakeholder noted that an organization comprised of academic, manufacturing, technology, and government stakeholders created credentials, and members agreed that the credentials represented skills critical for working in their sector.

Improving Access to Training Can Lead to Greater Worker Participation and Opportunities to Obtain In-Demand Jobs

According to stakeholders, access to training presents a key challenge to obtaining skills needed for in-demand jobs, and workers would benefit from better solutions related to childcare concerns, scheduling, financial hardships, or geography.

- **Childcare concerns.** State board stakeholders from all four states, as well as other interviewed stakeholders, cited childcare obligations as a significant barrier to accessing job training, with stakeholders from one state noting barriers are exacerbated by a shortage of affordable childcare options for many parents. Furthermore, government representatives on one state board said childcare services had been reduced recently (and therefore childcare options diminished), and a business representative from another state board said childcare had been significantly disrupted by the pandemic. The level of concern over lack of childcare aligns with our prior work, which identified childcare as one of the two most-needed support services and was particularly challenging for rural and tribal communities.[63]
- **Difficulties with scheduling.** Two stakeholders also said that inconvenient training program schedules can hinder access, such as when training conflicts with work hours for workers with ongoing jobs.

[62]Lawrence F. Katz et al., "Why Do Sectoral Employment Programs Work? Lessons from WorkAdvance," paper from *JOLE* Virtual Conference in Honor of Alan Krueger (version from December 10, 2020). This study noted that it was not clear exactly which mechanisms of the training programs studied produced these gains. The study stated that a combination of upfront screening of applicants on basic skills and motivation, training on soft skills, and wraparound support services were all characteristics of the training programs that resulted in the largest and most persistent wage gains.

[63]GAO, *Economic Adjustment Assistance: Actions Needed to Better Address Workers' Needs and Assess Program Effectiveness*, GAO-20-521 (Washington, D.C.: July 29, 2020).

For example, one local workforce board director stated that training programs scheduled to operate over a long period of time may be unattractive to workers, who cannot put their life on hold for the duration of the program.

- **Financial hardships.** Several stakeholders also said that workers who would benefit from training may face financial hardships, especially if they struggle to cover living expenses while enrolled in unpaid training. For example, state board stakeholders from two states and other stakeholders said that income insecurity was a major challenge for at-risk or unemployed workers. Faced with a decision about whether to engage in training that may boost job prospects and earnings long term on the one hand, or work in a job that offers low but immediate pay on the other hand, potential participants may choose the latter. Unpaid training can worsen financial hardships since time spent in training may erode savings a participant might have.
- **Transportation and geographic barriers.** Several stakeholders also noted barriers relating to transportation or geography, including lack of consistent transportation to training or job sites. For example, representatives from three state boards and other stakeholders interviewed said that available jobs might be far away from some local areas. Likewise, three stakeholders noted that some areas with more employment opportunities were difficult to reach for some job seekers, creating transportation and geographic barriers to employment. We have also found that job automation varies significantly by geographic location, with certain areas of the country more reliant on occupations susceptible to automation.[64] This could exacerbate automation's effects on the labor market in particular geographic locations.

Programs that respond to these challenges can help Americans access training aimed at entry into in-demand jobs, according to stakeholders. For example, several stakeholders stated they saw wraparound services as useful for mitigating access challenges. A state agency representative said that a community college had helped job seekers experiencing homelessness through comprehensive wraparound services that included connecting them with housing support and helping them apply for COVID-19-related grants. Stakeholders also said that training participation rates may improve as a result of wraparound services (such as substance

[64]GAO-19-257. Census Bureau officials said the agency has recently produced new maps that show the concentration of robotics adopters in manufacturing across states and the susceptibility of workers to automation.

abuse counseling) that address participants' personal struggles. Likewise, one study noted that wraparound services may be particularly important for training participants who may find it difficult to thrive in more traditional postsecondary educational institutions.[65]

Two state board stakeholders stated that training programs should consider optimal schedules for their target population. Specifically, scheduling training outside of normal work hours and for relatively short periods may enable attendance for workers with schedule conflicts stemming from their ongoing jobs or other obligations. For example, a state workforce board labor representative credited the short length (15 weeks) of a general industrial training program with its success in placing participants in employment.

Another strategy to promote greater access to job training is for programs to offer financial support. Several stakeholders, as well as experts interviewed for a prior report, said training programs that pay stipends or combine work with training could help increase enrollment of at-risk workers.[66] This financial support may alleviate pressure to find immediate work that may come at the expense of obtaining in-demand skills. Stakeholders from several state boards spoke favorably of the federal Registered Apprenticeship program because it provides participants with income while it offers training. However, two stakeholders cautioned that these apprenticeship programs face barriers themselves, such as cost and administrative burden (as discussed further in the next section).

To lessen geographic barriers, state workforce board stakeholders mentioned several potential approaches. For example, stakeholders in one state suggested using technology to mitigate geographical challenges, and noted that a training provider received private funding to focus its efforts on underserved rural areas. Stakeholders in another state emphasized the need to promote more economic growth in rural areas. Other state stakeholders said that they should consider how to bring in-demand jobs to workers. Another factor to consider is the likelihood of a worker and their family choosing to relocate to a new area away from their established community. One stakeholder said relocation could be

[65]Lawrence F. Katz et al., "Why Do Sectoral Employment Programs Work? Lessons from WorkAdvance."

[66]GAO-21-324.

complex and disruptive, and suggested that it may not be the appropriate solution to geography-related challenges.

Washington Program Helps Mitigate Challenges by Tailoring Training to Meet Employer and Trainee Needs

Workforce officials in Washington highlighted its Job Skills Program, which pairs colleges with employers on a project basis to provide employers with the necessary support to meet their specific training needs. For example, a meat processing company partnered with a local community college to enhance its in-house training for an industrial maintenance certification. Trainees were paid for a 40-hour work week that included attending training for 16 hours a week at one pay rate, while working at the company for the remaining 24 hours at a different pay rate. The company also covered 66 percent of the tuition costs of the training. A company official reported that the training provided workers with opportunities to both improve their skills and move into higher-skilled positions within the company. In all, 15 workers were upskilled through the program, and most were promoted following training.

Stakeholders Cited Importance of Greater Investment in Training and Collaboration to Facilitate In-Demand Skills and Jobs

According to stakeholders, increasing investment in training and strengthening collaboration in the workforce system can mitigate challenges with funding and developing new training programs, thereby facilitating in-demand skills and jobs. Stakeholders from all four state workforce boards said their states have struggled with funding for training in various ways. For example, stakeholders from one state said that they pursue multiple funding sources but still find it difficult to fund trainings that the industry needs. Likewise, one local workforce board director stated that developing training programs is often costly, particularly when program administrators seek to improve accessibility through features like wraparound services.[67] We previously reported expert opinion that firms vulnerable to technological advancements may not have the resources to retrain workers, and one report we reviewed similarly noted that limited funding for training may especially limit lower-wage, front-line workers who are seeking advancement opportunities and are at significant risk of displacement due to automation and other technologies.[68]

Several stakeholders also noted that employers may face additional challenges in offering training, limiting the availability of programs. For example, several stakeholders from one state's workforce board said that employers hesitated to offer Registered Apprenticeships because they have burdensome administrative requirements. Another stakeholder also

[67]Board stakeholders from two states said that that their funding was not sufficient for wraparound services to accompany training programs, though one stakeholder emphasized that such services are meaningful components of training to get an in-demand job, rather than "just" another job.

[68]GAO-21-324 and *Talent Finance: A New Consensus and Return-To-Investment*. U.S. Chamber of Commerce Foundation (Washington D.C.).

noted the significant startup and administrative costs of Registered Apprenticeships, and said limited funding can make those programs unstable. Stakeholders from one state board suggested increasing federal funding for a state training program they said has shown good results and has a waitlist. Likewise, one study suggested that government could help employers by providing financial incentives for paid work-based learning in cooperation with external education and training partners who also receive government incentives for that training.

In addition, several stakeholders noted examples of collaboration that promoted entry into in-demand jobs. For example, stakeholders on one state board said their upskilling program encouraged collaboration among workforce development organizations, community colleges, and employers to provide participants a pathway from training to an in-demand job. A business representative on another state board highlighted a similar program, where a training provider solicited the input of local employers on course work and gathered their ideas for key course content. Lastly, another board representative from that state discussed a program, in which a company collaborated with another state's community college to train workers in advanced skills, including skills necessary for technician positions that the company and other employers had been struggling to fill. The state board stakeholder said that types of collaboration like this—employers partnering with academia—could reduce problems from programs operating in separate silos.

Similarly, many stakeholders noted the benefits of collaboration through industry partnerships. For example, one stakeholder noted that collaboration across industry, trainers, and government officials helps generate new job training programs to address the region's skill gaps. Likewise, a local workforce board launched a project involving hospital systems, clinics, and health care providers to identify high-demand occupations, learn how the region was producing skilled workers for those occupations, and identify the industry sector's challenges. As a result of that collaboration, the local area obtained an H-1B grant that provided federal funding to train health care providers and close the skills gap.[69] Additionally, one study we reviewed emphasized the importance of cross-stakeholder collaboration among stakeholders, such as workforce development boards, employers, training providers, and private entities.

[69]H-1B Skills Training grants fund projects that provide training and related activities to workers to assist them in gaining the skills and competencies needed to obtain or upgrade employment in high-growth industries or economic sectors. See 29 U.S.C. § 3224a.

Another study suggested that public-private partnerships may be needed to generate more comprehensive labor market information. According to the study, the information can then be used to better evaluate workers' outcomes, inform state decision-making, help employers invest in training, and help workers identify in-demand job opportunities.[70]

Agency Comments

We provided a draft of this report to the Departments of Labor and Commerce for review and comment. Both agencies provided technical comments, which we incorporated, as appropriate.

We are sending copies of this report to the appropriate congressional committees, the Secretary of Labor, the Secretary of Commerce, and other interested parties. In addition, the report is available at no charge on the GAO website at http://www.gao.gov.

If you or your staff have any questions about this report, please contact me at (202) 512-7215 or locked@gao.gov. Contact points for our Offices of Congressional Relations and Public Affairs may be found on the last page of this report. GAO staff who made key contributions to this report are listed in appendix II.

Dawn G. Locke, Acting Director
Education, Workforce, and Income Security Issues

[70]National Governors Association Center for Best Practices, *Future Workforce Now*.

Appendix I: Objectives, Scope, and Methodology

The objectives of this review were to examine (1) what available data indicate about which workers are at risk of automation and the skills needed for in-demand jobs; and (2) what insights stakeholders offer for workforce programs to better serve displaced workers, and those affected by automation.

Section 1: Analyses Using Data from the Bureau of Labor Statistics and Occupational Information Network

For our first objective, we analyzed Department of Labor (DOL) data to identify occupations projected to grow over the next decade, as well as the skills associated with those growing occupations. Interviews with officials from selected case study states (described in Section 2 in this appendix) helped us understand what data existed on in-demand jobs and skills on a state and local level, and likewise, what data were unavailable to state and local stakeholders.

This section describes our methodology for identifying "in-demand" jobs, the methodology for matching occupational data from the U.S. Bureau of Labor Statistics (BLS) Employment Projections data to the DOL Occupational Information Network (O*NET) skills data, and how we identified the skills deemed important for our "in-demand" jobs.[1] It also presents the results of the analysis, as well as the associated caveats and limitations. We established the reliability of these data through a

[1]BLS's Employment Projections (EP) program publishes 10-year projections of national employment by industry and occupation based on analysis of historical and current economic data for the labor market, the macroeconomy, and industrial activity. The projections are developed annually and present employment for approximately 300 industries and about 800 occupations covering all occupations in the U.S. economy.

O*NET is a comprehensive database of worker attributes and job characteristics. The O*NET Data Collection Program provides information on skills, knowledge, abilities, and other information on nearly 1,000 occupations covering the entire U.S. economy. According to DOL officials, O*NET data are collected through a statistically valid two-stage sampling method of selected business establishments and incumbent workers within those sampled businesses. This is supplemented with responses from occupational experts (who are not themselves incumbent workers in the occupation) and occupation analysts—both of whom have knowledge of the requirements of work in relevant occupations. The O*NET survey methodology has been approved and re-approved by the Office of Management and Budget every 3 years since 2000.

The number of occupations is higher in O*NET than in the Employment Projections because O*NET provides information on some occupations at a more detailed level than the Employment Projections. Moreover, according to BLS officials, while O*NET provides some information for all occupations in the economy, it does not provide O*NET-specific information (such as knowledge, skills, and abilities) for residual ("All Other") occupations. Even though O*NET does not have O*NET-specific data at the residual level, it may incorporate more detailed occupations within the broader "All Other" category which have O*NET-specific data.

review of relevant agency documentation and interviews with knowledgeable agency officials.

Selection of In-Demand Jobs

Although BLS had released 2020-2030 projections at the time of our analysis and also provided a list of occupations that excluded those most affected by the pandemic, we decided to use projections for 2019-2029. We did so because the COVID-19 pandemic triggered an economic recession from February to April 2020, which led to substantial and immediate declines in output and employment during that period. Because 2020 serves as the base year for BLS's 2020–30 projections, these recession impacts translate to lower base-year employment values than seen in recent projections and, therefore, disproportionately higher projected employment growth between 2020 and 2030 among the occupations most affected by the 2020 recession. Consequently, industries most affected by the pandemic, such as accommodations and food services, would see a large change in employment, partly due to the low base and the accompanying short-term recovery. Thus the 2020-2030 employment growth projections include both short-term recovery from the pandemic and longer-term structural changes, and it is unclear what portion of the projected growth is due to the short-term pandemic recovery versus structural changes. Moreover, besides the pandemic affecting short-term changes in employment, it might have longer-term impacts (independent of or in addition to structural changes already underway before the pandemic). However it will take at least a few years or perhaps longer for those longer-term pandemic-related effects to be known and accounted for in the employment projections.[2]

For these reasons, we concluded that using 2020-2030 projections with all occupations would lead us to select occupations with high growth due primarily to having been more affected by the pandemic, thus the growth rate could represent short-term adjustments to the recession rather than long-term structural changes. We also concluded that using the 2020-2030 projections excluding occupations most affected by the pandemic omits almost half of all occupations—some or many of which may have had high growth due to long-term structural factors, as well as short-term adjustments—but we would be excluding them altogether because we could not distinguish what share of the growth rate was due to structural factors versus short-term adjustments. Additionally, we concluded that using 2019-2029 projections, while based on data that are 1 year older,

[2]For a fuller discussion, see Kevin S. Dubina, Lindsey Ice, Janie-Lynn Kim, and Michael J. Rieley, "Projections overview and highlights, 2020–30," *Monthly Labor Review* (U.S. Bureau of Labor Statistics, October 2021), https://doi.org/10.21916/mlr.2021.20.

represented the best option for capturing the longer-term structural changes to the economy, including those associated with trends in technological change, economic policy and other macro-economic indicators that affect employment levels.[3] Thus, we used 2019-2029 employment projections to identify "in-demand" jobs.[4]

The following describes how we selected our "in-demand" occupations:

1. We excluded occupations with a lower than average 2019-2029 change in employment levels, both overall (i.e., no education filter) and by education level (high school or less, some college, and bachelor's and above). This ensured that we did not include occupations that were adding a relatively small number of jobs over the period but with a high growth mainly due to the low base. Specifically, given this selection criteria:
    a. For the overall list (no education filter), we restricted our "in-demand" jobs to those occupations that were projected to add more than about 7,600 jobs from 2019 through 2029 (i.e., the average job gain across all occupations for this period.)
    b. For the "high school or less" list, we restricted our jobs to those occupations with a typical entry level education, based on BLS's projections data, of "high school diploma or equivalent" or "no formal educational credential." We further restricted our jobs to those occupations that were projected to add more than about 5,200 jobs from 2019 through 2029 (i.e., the average job gain during the 2019-2020 period for occupations where the typical entry level education was high school or less).
    c. For the "some college" list, we restricted our jobs to those occupations with a typical entry level education, based on BLS's projections data, of "associate's degree" or "postsecondary

[3]Using 2019-2029 projections does not incorporate the effects of the pandemic. Given the uncertainty around the long-term effects of the pandemic, this is an important caveat of our analysis. For example, the pandemic introduced large numbers of employers and employees to remote work. If these arrangements become more frequent in the long term they could have direct effects on employment. For a more detailed discussion see Lindsey Ice and Michael J. Reiley, "Expected pandemic-driven employment changes: a comparison of 2019–29 and 2020–30 projection sets," *Monthly Labor Review* (U.S. Bureau of Labor Statistics, February 2022), https://doi.org/10.21916/mlr.2022.5.

[4]We consulted DOL on our approach, and DOL officials agreed that the reasoning behind our approach was sound.

nondegree award" or "some college, no degree." We further restricted our jobs to those occupations that were projected to add more than about 8,100 jobs from 2019 through 2029 (i.e., the average job gain during the 2019-2020 period for occupations where the typical entry level education was some college).

d. For the "bachelor's and above" list we restricted our jobs to those occupations with a typical entry-level education, based on BLS's projections data, of "bachelor's degree" or "doctoral or professional degree" or "master's degree." We further restricted our jobs to those occupations that were projected to add more than about 11,300 jobs from 2019 through 2029 (i.e., the average job gain during the 2019-2020 period for occupations where the typical entry level education was bachelor's degree and above).

2. From each of the four lists (overall; high school or less; some college; and a bachelor's and above), we selected the 20 occupations with the fastest 2019-2029 growth rate.

Thus we use the phrase "in-demand jobs" to refer to occupations that, among the set of occupations with above-average change in employment levels, DOL projects will grow the fastest. In summary, in order to identify "in-demand" jobs, we restricted such jobs to those occupations that were projected to add more than the average job gain during the 2019-2029 period for that education group (i.e., overall, high school or less, some college and bachelor's and above). Of these, we then chose the 20 fastest growing occupations for each group. Using this approach, our analyses excluded occupations that were projected to add relatively few jobs, even if they were projected to grow quickly. For example, the occupation of wind turbine technicians had the highest growth rate (61 percent), but was projected to add a total of about 4,300 new jobs over the 2019-2029 period. Thus, even though the occupation is growing quickly, it is nevertheless adding relatively few jobs over the 2019-2029 period and was therefore excluded, based on our selection criteria for "in-demand" jobs.

Matching BLS Employment Projections to O*NET Data

BLS Employment Projections data are at the six-digit Standard Occupational Classification level, and the O*NET data are at the eight-digit occupational code level. Because of differences in the purpose and methods of data collection across programs—differences that result in a different set of occupations included in each program—matching the BLS Employment Projections and O*NET data requires resolving various types of non-matches. We matched the Employment Projections data to

the O*NET skills data using the matching data provided by DOL, where the agency provided us with the BLS Employment Projections code, the associated O*NET code, and the weight assigned to each O*NET occupation code based on employment, among other variables. The matching was based on a BLS publication in which BLS outlined how to match projections data to O*NET data, such as by doing direct matches (i.e., those occupations that in the O*NET data are at the six-digit level, ending in xx-xxxx.00), and doing employment weighted scores for matches that were not directly matched, among other steps.[5]

We used O*NET skills data based on O*NET 25.0, which was published in August 2020, along the O*NET 25.0 mapping provided by DOL.[6]

Determining Skills Deemed Important for "In-Demand" Jobs

The O*NET skills database has 35 elements, broadly categorized into "basic" skills and "cross functional" skills. The basic skills are shown below:

- Content: reading comprehension; active listening; writing; speaking; mathematics; science
- Process: critical thinking; active learning; learning strategies; monitoring

The cross functional skills are further broken down into five categories:

- Complex problem solving skills
- Resource management skills: management of financial resources; management of material resources; management of personnel resources; time management
- Social skills: coordination; instructing; negotiation; persuasion; service orientation; social perceptiveness
- Systems skills: judgment and decision-making; systems analysis; systems evaluation

[5]For more information on BLS's method for mapping occupational data from the BLS's Employment Projections program to the U.S. Department of Labor O*NET data, see Amy Hopson, "Mapping Employment Projections and O*NET data: a methodological overview," *Monthly Labor Review* (U.S. Bureau of Labor Statistics, August 2021), https://doi.org/10.21916/mlr.2021.18

[6]We did not use O*NET 26.0, published in August 2021, because skills data for some occupations, including those in the list of our "in-demand" jobs, in the 26.0 O*NET dataset were not yet available at the time of our analysis.

- Technical skills: equipment maintenance; equipment selection; installation; operation and control; operations analysis; operations monitoring; programming; quality control analysis; repairing; technology design; troubleshooting.

O*NET contains two scores for each of the 35 elements: one for *importance* and one for *level.*[7] For *importance*, the rating indicates the degree of importance a particular descriptor is to the occupation. The possible ratings range from 1 (not important) through 5 (extremely important). For *level,* the rating indicates the degree to which a particular descriptor is required or needed to perform the occupation. The possible ratings range from 1 through 7. For our analysis, we decided to use only the *importance* score due to the high correlation between the importance and the *level* scores. According to our analysis of O*NET skills data, the correlation between the *importance* and level score was 0.97.[8] We created two main analyses:

- For each of our 20 "in-demand" jobs, we counted the total number of skills deemed important. Specifically, we counted the skills for each top 20 in-demand occupation that had an *importance* score of 3 and above.[9] We also present other selected characteristics for these occupations, such as median wages.
- For each of the 35 skills in the dataset, we calculated a weighted average (weighted by 2019 employment) *importance* score for each list (overall and by education level) of top 20 in-demand occupations, as well as for those occupations not in our top-20 in-demand occupations list. This allowed us to examine what skills are deemed the most important, on average, for our top 20 in-demand occupations for each education group, with the non-top 20 occupations serving as a comparison group. In order to identify the skills that are, on average, deemed important for each education group (i.e., overall, high school

[7]According to O*NET, a skill is the ability to perform a task well. It is usually developed over time through training or experience. A skill can be used to do work in many jobs or it can be used in learning.

[8]According to DOL officials, the article, "Mapping Employment Projections and O*NET data: a methodological overview," *Monthly Labor Review* (U.S. Bureau of Labor Statistics, August 2021), https://doi.org/10.21916/mlr.2021.18 included just "importance" of skills (and not "level") because they noticed a high correlation between ratings of importance and level.

[9]We defined a skill as deemed "important" if the *importance* score is 3 or above given that, according to the O*NET skills questionnaire, when asked the question "How important is the skill to the performance of your current job?" the job incumbent's answer can be: (3) if "important", (4) if "very important" or (5) if "extremely important."

or less, some college, bachelor's and more) of the top 20 in-demand jobs, we highlight the skills that have a weighted average score of 3 and above.

In-Demand Jobs and Selected Characteristics, Including Total Number of Skills Deemed Important

For each education category, table 2 lists the top 20 in-demand occupations we selected based on our criteria described above. The table also presents selected characteristics for each occupation, such as the typical education needed for entry; total number of skills deemed important; and median wages for that occupation and for all occupations with the associated typical entry level education.

As an additional analysis, for both the sample of top 20 in-demand occupations overall and the entire dataset, which included all occupations (i.e., top 20 and non-top 20 in-demand occupations), we examined if occupations with a higher wage or a higher education level needed for entry tended to have more skills deemed important (i.e., an importance score of 3 and above). Specifically, we regressed the total number of skills deemed important on the median annual wage and regressed the total number of skills deemed important on the typical education needed for entry. We found a positive and statistically significant relationship between the total number of skills deemed important and the education level, as well as between the total number of skills deemed important and the median annual wage in both the sample of our top 20 in-demand occupations and in the dataset which included all occupations. These relationships represent correlations, and we did not control for other factors. Thus, they could be driven by factors related to the total number of skills deemed important and to the education level, or to the total number of skills deemed important and to wages.

Table 2: Selected Characteristics of Top 20 In-demand Occupations, by Education Level

Occupation title	Occupation code	Employment, 2019 (thousands)	Projected employment, 2029 (thousands)	Projected employment change 2019-2029 (thousands)	Projected employment change 2019-2029 (percent)	Typical education needed for entry	Total number of skills deemed important	Median annual wage in dollars (2020)	Median annual wage in dollars (2020) for occupations with corresponding typical entry-level education
Top 20 in-demand occupations and selected characteristics, overall									
Nurse practitioners	29-1171	211.3	322	110.7	52.4	Master's degree	22	111,680	76,800
Statisticians	15-2041	42.7	57.5	14.8	34.6	Master's degree	15	92,270	76,800
Occupational therapy assistants	31-2011	47.1	63.5	16.3	34.6	Associate's degree	16	62,940	55,870
Home health and personal care aides	31-1120	3439.7	4599.2	1159.5	33.7	High school diploma or equivalent	10	27,080	39,070

Source: GAO analysis of U.S. Bureau of Labor Statistics (BLS) Employment Projections (EP) program data and U.S. Department of Labor (DOL) Occupational Information Network (O*NET) data. | GAO-22-105159

Notes: In order to identify the top 20 in-demand jobs, we restricted such jobs to those occupations that BLS projected to add more than the average job gain during the 2019-2029 period for that education group (i.e., overall, high school or less, some college and bachelor's and above). Of these, we then chose the 20 fastest growing occupations for each group. In order to calculate the total number of skills deemed important, we counted the number of skills with an importance score greater or equal to 3 based on O*NET 25.0 skills data. We chose this threshold because, according to the O*NET skills questionnaire, when asked the question "How important is the skill to the performance of your current job?" the job incumbent's answer can be: (3) if "important", (4) if "very important" or (5) if "extremely important."

Average Importance Score by Education Level

Table 3 shows the weighted average importance score and weighted standard deviation (weighted by 2019 employment) for each list of top 20 in-demand jobs as well as non-top 20 jobs for each level of typical education needed for entry. Weighted average scores with a value of greater or equal to 3 are highlighted in order to highlight the skills that are, on average, deemed important for that list based on the value of the weighted average score. Given that this is for the average occupation in that group (i.e., for the typical worker in that education group), even if a skill is not deemed important on average it might be important for particular occupations in that group. For example, even though repairing has the lowest weighted average score in the top 20 in-demand occupations (overall), it is a skill deemed important for the occupation "service unit operators, oil and gas."

Table 3: Skills Average Importance Scores for Top 20 and Non-Top 20 In-Demand Occupations, by Education Level

Standard deviation (SD) in parentheses

Skill name	Average and SD, non-top 20 overall	Average and SD, top 20 overall	Average and SD, non-top 20 high school or less	Average and SD, top 20 high school or less	Average and SD, non-top 20 some college	Average and SD, top 20 some college	Average and SD, non-top 20 bachelor's and above	Average and SD, top 20 bachelor's and above

Source: GAO analysis of U.S. Bureau of Labor Statistics (BLS) Employment Projections (EP) program data and U.S. Department of Labor (DOL) Occupational Information Network (O*NET) data. | GAO-22-105159

Notes: In order to identify the top 20 in-demand jobs, we restricted such jobs to those occupations that were projected to add more than the average job gain during the 2019-2029 period for each education group (i.e., overall, high school or less, some college and bachelor's and above). Of these, we then chose the 20 fastest growing occupation for each group. We then calculated the average importance value, weighted by 2019 employment, for each of the 35 skills in O*NET 25.0 for each group of top 20 and non-top 20 in-demand jobs for each education group. Shaded scores are for the skills deemed important for that group (i.e., skills with a weighted average score value greater or equal to 3). We chose this threshold because, according to the O*NET skills questionnaire, when asked the question "How important is the skill to the performance of your current job?" the job incumbent's answer is (3) if "important", (4) if "very important" or (5) if "extremely important". Standard deviations (SD) weighted by 2019 employment are in parentheses.

Caveats and Limitations

Uncertainty exists in the projections and the skills that will be deemed important in the future. Projections are estimates of future job growth

based on a series of modeling assumptions.[1] As with any projections, the projections for individual occupations are subject to error because of the many unknown factors that may affect the economy over the projection period. Thus, due to a variety of factors, actual changes in employment might differ from projected changes. Moreover, our analysis of skills is based on the skills that are currently deemed important, while the skills deemed important in the future might differ from the skills deemed important currently.

According to BLS's documentation, its 2019-2029 Employment Projections do not include impacts of the COVID-19 pandemic and response efforts. The BLS Employment Projections are developed using models based on historical data, as well as other qualitative and quantitative information available at the time the projections are made. This set of projections covers the time period through 2019; all input data therefore precede the pandemic.

We examined national-level projections, though projections might differ across localities. Given that we used national data, the data did not allow a discussion of where the "in-demand" jobs would be located. For example, even if an occupation is projected to grow at the national level it does not mean that it will be growing in all localities. Moreover, given that these are national level data, the characteristics of the selected occupations, such as median wages, might differ across localities.

The skills needed for a particular occupation might differ across localities and firms. The data did not allow us to discuss how the skills need for a particular occupation differ across locations or firms. According to DOL officials, customers should not use O*NET data and applications as a stand-alone, off-the-shelf tool to make selection or hiring decisions. Instead, for these type of human resource activities, O*NET data can serve an important starting point for job analyses. However, the data

[1]The BLS's projections of industrial and occupational employment are developed in a series of six interrelated steps, each of which is based on a different procedure or model and related assumptions: labor force, aggregate economy, final demand (GDP) by consuming sector and product, industry output, employment by industry, and employment by occupation. For example, according to DOL officials, one of the key assumptions of the projections is full employment. That is, the 10-year projections assume the economy will be operating at its full potential and the unemployment rate is equal to the nonaccelerating inflation rate of unemployment. The purpose of this assumption is to focus on the long-term trends in the economy by excluding the effects of the business cycle.

would need to be reviewed, augmented, and validated for the particular purpose and local organization context.[2]

Further, the O*NET skills presented are broad and may not allow for nuanced analysis in some instances, according Employment and Training Administration officials.

Any relationships we present are correlations and, as such, could be driven by other factors. For example, the statistically significant relationship between the total number of skills deemed important and the median annual wage could be driven by factors related to both the total number of skills deemed important and to median annual wages.

Section 2: Other Analyses

To address both objectives, we conducted interviews with stakeholders from four states: California, Kentucky, Pennsylvania and Washington. For our state selection process, we sought recommendations through initial stakeholder interviews and non-GAO reports that mentioned state programs as particularly effective in supporting at-risk workers. We also sought to select states that had a high concentration of jobs susceptible to automation by referring to a prior GAO report.[3] Additionally, we sought states that had diversity across urban and rural geographies using Census data on urban and rural area classifications, including one state that did not have an urban area in the top 25 most populous in the United States (Kentucky).[4] We also sought to select states with diversity in the type of their in-demand jobs, using data submitted to DOL by states.

In each state, we conducted semi-structured interviews with state workforce boards, which generally included representation from government agencies, business, labor, and training providers. In each state, we obtained information from local workforce boards recommended to us by state workforce board representatives as having particularly

[2]According to DOL officials, occupation is a concept—that groups many specific jobs across specific industries, representing many specific firms, in different parts of the country—all of which likely have distinct features that cannot be captured in aggregate national occupational data.

[3]GAO, *Workforce Automation: Better Data Needed to Assess and Plan for Effects of Advanced Technologies on Jobs*, GAO-19-257 (Washington, D.C.: Mar. 7, 2019).

[4]To qualify as an urban area under the Census Bureau classification, a territory must encompass at least 2,500 people, at least 1,500 of which reside outside institutional group quarters. Rural areas encompass all population, housing, and territory not included within an urban area. For additional information, see the 2010 Census Urban and Rural Classification and Urban Area Criteria.

noteworthy programs or experience. We asked questions related to how the states collect data on, and challenges to, obtaining in-demand jobs, and examples of workforce training programs to serve at-risk workers. The views of the stakeholders we interviewed provided illustrative examples on these topics and are not generalizable.

In addition, we asked interviewees for their views on how well federal workforce programs served at-risk workers. Specifically, we asked about four such programs: (1) WIOA Dislocated Worker Formula Program, (2) WIOA National Dislocated Worker Grants, (3) H1-B Job Training Grants, and (4) Registered Apprenticeship program. To identify these four programs, we reviewed our prior work that cataloged federal employment and training programs.[5] To narrow this list of programs to those that could serve workers at risk of losing their jobs to automation, we narrowed it to only programs that served the general population; provided occupational training; targeted workers who were on the job, underemployed or displaced; did not base eligibility on income; and had a goal of providing skills for in-demand jobs. We also reviewed a second GAO report that reviewed economic adjustment assistance programs that could serve workers, including programs that pertained to workers laid off due to any reason (as opposed to those laid off from a specific economically disruptive event, such as trade).[6]

Additionally, we interviewed stakeholders, including officials from DOL and the Census Bureau, as well as nine other organizations, such as national organizations of state workforce boards and agencies, business, labor, industry, and academic organizations, to obtain their perspectives on skills needed for in-demand jobs and challenges to obtaining those jobs.[7] We selected these stakeholders based on our prior work on automation and workforce issues, as well as additional suggestions from initial outreach. In the report, we use the term “other stakeholders interviewed” to specify we are referring to stakeholders not from a state or

[5]GAO, *Employment and Training Programs: Department of Labor Should Assess Efforts to Coordinate Services Across Programs*, GAO-19-200 (Washington, D.C.: Mar. 28, 2019).

[6]GAO, *Economic Adjustment Assistance: Actions Needed to Better Address Workers’ Needs and Assess Program Effectiveness*, GAO-20-521 (Washington, D.C.: July 29, 2020).

[7]These organizations include Upskill America, Burning Glass Technologies, the Georgetown Center on Education and the Workforce, the National Association of Workforce Boards, the National Association of State Workforce Agencies, and the National Governors Association.

local workforce board. The views of the stakeholders we interviewed provided illustrative examples on these topics and are not generalizable.

In describing responses of interviewees, the report sometimes specifies the number of states or stakeholders who voiced a particular response (such as “four states,” or “two business representatives”). In other instances, the report uses other terms to describe the number of responses. As used in the report, the term “several” indicates that three to four stakeholders gave a particular response, while the term “many” indicates that five or more stakeholders gave a particular response.

In addition to the GAO reports discussed above, we reviewed other GAO reports related to automation’s effects on the labor market. These GAO reports were published in the last 5 years and focused on automation, labor market policies, or in-demand jobs or skills.[8]

Additionally, we reviewed other relevant literature for information related to our objectives. We performed a literature search based on search terms related to the engagement’s objectives, such as automation, skill, and workforce. We narrowed search results by excluding articles or studies that did not include the United States, were more than 5 years old, and did not provide information related to the engagement’s objectives. We also reviewed several reports referred to us by interviewed stakeholders. We determined the credibility of relevant literature by reviewing the methodology and conclusions of those studies. We incorporated the results of our literature analyses into the report as appropriate. We did not conduct a comprehensive review of the factors that affect a firm’s decision to automate any of its tasks, but rather focused on the labor market once the automation decision has been made.

In addition, we reviewed relevant federal laws, regulations, and guidance.

[8]GAO reports we reviewed include: GAO, *Workforce Automation: Better Data Needed to Assess and Plan for Effects of Advanced Technologies on Jobs*, GAO-19-257 (Washington, D.C.: Mar. 7, 2019); *Automated Trucking: Federal Agencies Should Take Additional Steps to Prepare for Potential Workforce Effects*, GAO-19-161 (Washington, D.C.: Mar. 7, 2019); *Economic Adjustment Assistance: Actions Needed to Better Address Workers’ Needs and Assess Program Effectiveness*, GAO-20-521 (Washington, D.C.: July 29, 2020); and *Economic Adjustment Assistance: Experts’ Proposed Reform Options to Better Serve Workers Experiencing Economic Disruption*, GAO-21-324 (Washington, D.C.: Apr. 19, 2021).

We conducted this performance audit from April 2021 to August 2022 in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

Dawn G. Locke, (202) 512-7215 or locked@gao.gov

Staff Acknowledgments

In addition to the contact named above, Meeta Engle (Assistant Director), Andrew Nelson (Analyst-In-Charge), Laura Abendroth, and Dylan Desjardins made significant contributions to this report. Also contributing to this report were Charlotte Cable, Lilia Chaidez, Sherwin Chapman, Gabrielle Crossnoe, Hayden Huang, Kirsten Lauber, Lara Laufer, Ty Mitchell, Nhi Nguyen, Stacy Ouellette, Dae Park, Moon Parks, James Rebbe, Almeta Spencer, Curtia Taylor, Adam Wendel, and Candice Wright.

GAO's Mission

The Government Accountability Office, the audit, evaluation, and investigative arm of Congress, exists to support Congress in meeting its constitutional responsibilities and to help improve the performance and accountability of the federal government for the American people. GAO examines the use of public funds; evaluates federal programs and policies; and provides analyses, recommendations, and other assistance to help Congress make informed oversight, policy, and funding decisions. GAO's commitment to good government is reflected in its core values of accountability, integrity, and reliability.

Obtaining Copies of GAO Reports and Testimony

The fastest and easiest way to obtain copies of GAO documents at no cost is through our website. Each weekday afternoon, GAO posts on its website newly released reports, testimony, and correspondence. You can also subscribe to GAO's email updates to receive notification of newly posted products.

Order by Phone

The price of each GAO publication reflects GAO's actual cost of production and distribution and depends on the number of pages in the publication and whether the publication is printed in color or black and white. Pricing and ordering information is posted on GAO's website, https://www.gao.gov/ordering.htm.

Place orders by calling (202) 512-6000, toll free (866) 801-7077, or TDD (202) 512-2537.

Orders may be paid for using American Express, Discover Card, MasterCard, Visa, check, or money order. Call for additional information.

EXECUTIVE OFFICE OF THE PRESIDENT

WASHINGTON, D.C. 20502

December 20, 2016

Advances in Artificial Intelligence (AI) technology and related fields have opened up new markets and new opportunities for progress in critical areas such as health, education, energy, economic inclusion, social welfare, and the environment. In recent years, machines have surpassed humans in the performance of certain tasks related to intelligence, such as aspects of image recognition. Experts forecast that rapid progress in the field of specialized artificial intelligence will continue. Although it is unlikely that machines will exhibit broadly-applicable intelligence comparable to or exceeding that of humans in the next 20 years, it is to be expected that machines will continue to reach and exceed human performance on more and more tasks.

AI-driven automation will continue to create wealth and expand the American economy in the coming years, but, while many will benefit, that growth will not be costless and will be accompanied by changes in the skills that workers need to succeed in the economy, and structural changes in the economy. Aggressive policy action will be needed to help Americans who are disadvantaged by these changes and to ensure that the enormous benefits of AI and automation are developed by and available to all.

Following up on the Administration's previous report, *Preparing for the Future of Artificial Intelligence*, which was published in October 2016, this report further investigates the effects of AI-driven automation on the U.S. job market and economy, and outlines recommended policy responses.

This report was produced by a team from the Executive Office of the President including staff from the Council of Economic Advisers, Domestic Policy Council, National Economic Council, Office of Management and Budget, and Office of Science and Technology Policy. The analysis and recommendations included herein draw on insights learned over the course of the Future of AI Initiative, which was announced in May of 2016, and included Federal Government coordination efforts and cross-sector and public outreach on AI and related policy matters.

Beyond this report, more work remains, to further explore the policy implications of AI. Most notably, AI creates important opportunities in cyberdefense, and can improve systems to detect fraudulent transactions and messages.

Executive Summary

Accelerating artificial intelligence (AI) capabilities will enable automation of some tasks that have long required human labor.[1] These transformations will open up new opportunities for individuals, the economy, and society, but they have the potential to disrupt the current livelihoods of millions of Americans. Whether AI leads to unemployment and increases in inequality over the long-run depends not only on the technology itself but also on the institutions and policies that are in place. This report examines the expected impact of AI-driven automation on the economy, and describes broad strategies that could increase the benefits of AI and mitigate its costs.

Economics of AI-Driven Automation

Technological progress is the main driver of growth of GDP per capita, allowing output to increase faster than labor and capital. One of the main ways that technology increases productivity is by decreasing the number of labor hours needed to create a unit of output. Labor productivity increases generally translate into increases in average wages, giving workers the opportunity to cut back on work hours and to afford more goods and services. Living standards and leisure hours could both increase, although to the degree that inequality increases—as it has in recent decades—it offsets some of those gains.

AI should be welcomed for its potential economic benefits. Those economic benefits, however, will not necessarily be evenly distributed across society. For example, the 19th century was characterized by technological change that raised the productivity of lower-skilled workers relative to that of higher-skilled workers. Highly-skilled artisans who controlled and executed full production processes saw their livelihoods threatened by the rise of mass production technologies. Ultimately, many skilled crafts were replaced by the combination of machines and lower-skilled labor. Output per hour rose while inequality declined, driving up average living standards, but the labor of some high-skill workers was no longer as valuable in the market.

In contrast, technological change tended to work in a different direction throughout the late 20th century. The advent of computers and the Internet raised the relative productivity of higher-skilled workers. Routine-intensive occupations that focused on predictable, easily-programmable tasks—such as switchboard operators, filing clerks, travel agents, and assembly line workers—were particularly vulnerable to replacement by new technologies. Some occupations were virtually eliminated and demand for others reduced. Research suggests that technological innovation over this period increased the productivity of those engaged in abstract thinking, creative tasks, and problem-solving and was therefore at least partially responsible for the substantial growth in jobs employing such traits. Shifting demand towards more skilled labor raised the relative pay of this group, contributing to rising inequality. At the same time, a

[1] A more extensive introductory discussion of artificial intelligence, machine learning, and related policy topics can be found in the Administration's first report on this subject. *See* The White House, "Preparing for the Future of Artificial Intelligence," October 2016 (https://www.whitehouse.gov/sites/default/files/whitehouse_files/microsites/ostp/NSTC/preparing_for_the_future_of_ai.pdf).

slowdown in the rate of improvement in education, and institutional changes such as the reduction in unionization and decline in the minimum wage, also contributed to inequality—underscoring that technological changes do not uniquely determine outcomes.

Today, it may be challenging to predict exactly which jobs will be most immediately affected by AI-driven automation. Because AI is not a single technology, but rather a collection of technologies that are applied to specific tasks, the effects of AI will be felt unevenly through the economy. Some tasks will be more easily automated than others, and some jobs will be affected more than others—both negatively and positively. Some jobs may be automated away, while for others, AI-driven automation will make many workers more productive and increase demand for certain skills. Finally, new jobs are likely to be directly created in areas such as the development and supervision of AI as well as indirectly created in a range of areas throughout the economy as higher incomes lead to expanded demand.

Recent research suggests that the effects of AI on the labor market in the near term will continue the trend that computerization and communication innovations have driven in recent decades. Researchers' estimates on the scale of threatened jobs over the next decade or two range from 9 to 47 percent. For context, every 3 months about 6 percent of jobs in the economy are destroyed by shrinking or closing businesses, while a slightly larger percentage of jobs are added—resulting in rising employment and a roughly constant unemployment rate. The economy has repeatedly proven itself capable of handling this scale of change, although it would depend on how rapidly the changes happen and how concentrated the losses are in specific occupations that are hard to shift from.

Research consistently finds that the jobs that are threatened by automation are highly concentrated among lower-paid, lower-skilled, and less-educated workers. This means that automation will continue to put downward pressure on demand for this group, putting downward pressure on wages and upward pressure on inequality. In the longer-run, there may be different or larger effects. One possibility is superstar-biased technological change, where the benefits of technology accrue to an even smaller portion of society than just highly-skilled workers. The winner-take-most nature of information technology markets means that only a few may come to dominate markets. If labor productivity increases do not translate into wage increases, then the large economic gains brought about by AI could accrue to a select few. Instead of broadly shared prosperity for workers and consumers, this might push towards reduced competition and increased wealth inequality.

Historically and across countries, however, there has been a strong relationship between productivity and wages—and with more AI the most plausible outcome will be a combination of higher wages and more opportunities for leisure for a wide range of workers. But the degree that this materializes depends not just on the nature of technological change but importantly on the policy and institutional choices that are made about how to prepare workers for AI and to handle its impacts on the labor market.

Policy Responses

Technology is not destiny; economic incentives and public policy can play a significant role in shaping the direction and effects of technological change. Given appropriate attention and the right policy and institutional responses, advanced automation can be compatible with productivity, high levels of employment, and more broadly shared prosperity. In the past, the U.S. economy has adapted to new production patterns and maintained high levels of employment alongside rising productivity as more productive workers have had more incentive to work and more highly paid workers have spent more, supporting this work. But, some shocks have left a growing share of workers out of the labor force. This report advocates strategies to educate and prepare new workers to enter the workforce, cushion workers who lose jobs, keep them attached to the labor force, and combat inequality. Most of these strategies would be important regardless of AI-driven automation, but all take on even greater importance to the degree that AI is making major changes to the economy.

Strategy #1: Invest in and develop AI for its many benefits. If care is taken to responsibly maximize its development, AI will make important, positive contributions to aggregate productivity growth, and advances in AI technology hold incredible potential to help the United States stay on the cutting edge of innovation. Government has an important role to play in advancing the AI field by investing in research and development. Among the areas for advancement in AI are cyberdefense and the detection of fraudulent transactions and messages. In addition, the rapid growth of AI has also dramatically increased the need for people with relevant skills from all backgrounds to support and advance the field. Prioritizing diversity and inclusion in STEM fields and in the AI community specifically, in addition to other possible policy responses, is a key part in addressing potential barriers stemming from algorithmic bias. Competition from new and existing firms, and the development of sound pro-competition policies, will increasingly play an important role in the creation and adoption of new technologies and innovations related to AI.

Strategy #2: Educate and train Americans for jobs of the future. As AI changes the nature of work and the skills demanded by the labor market, American workers will need to be prepared with the education and training that can help them continue to succeed. Delivering this education and training will require significant investments. This starts with providing all children with access to high-quality early education so that all families can prepare their students for continued education, as well as investing in graduating all students from high school college- and career-ready, and ensuring that all Americans have access to affordable post-secondary education. Assisting U.S. workers in successfully navigating job transitions will also become increasingly important; this includes expanding the availability of job-driven training and opportunities for lifelong learning, as well as providing workers with improved guidance to navigate job transitions.

Strategy #3: Aid workers in the transition and empower workers to ensure broadly shared growth. Policymakers should ensure that workers and job seekers are both able to pursue the job opportunities for which they are best qualified and best positioned to ensure they receive an appropriate return for their work in the form of rising wages. This includes steps to modernize the social safety net, including exploring strengthening critical supports such as unemployment

insurance, Medicaid, Supplemental Nutrition Assistance Program (SNAP), and Temporary Assistance for Needy Families (TANF), and putting in place new programs such as wage insurance and emergency aid for families in crisis. Worker empowerment also includes bolstering critical safeguards for workers and families in need, building a 21st century retirement system, and expanding healthcare access. Increasing wages, competition, and worker bargaining power, as well as modernizing tax policy and pursuing strategies to address differential geographic impact, will be important aspects of supporting workers and addressing concerns related to displacement amid shifts in the labor market.

Finally, if a significant proportion of Americans are affected in the short- and medium-term by AI-driven job displacements, policymakers will need to consider more robust interventions, such as further strengthening the unemployment insurance system and countervailing job creation strategies, to smooth the transition.

Conclusion

Responding to the economic effects of AI-driven automation will be a significant policy challenge for the next Administration and its successors. AI has already begun to transform the American workplace, change the types of jobs available, and reshape the skills that workers need in order to thrive. All Americans should have the opportunity to participate in addressing these challenges, whether as students, workers, managers, technical leaders, or simply as citizens with a voice in the policy debate.

AI raises many new policy questions, which should be continued topics for discussion and consideration by future Administrations, Congress, the private sector, academia, and the public. Continued engagement among government, industry, technical and policy experts, and the public should play an important role in moving the Nation toward policies that create broadly shared prosperity, unlock the creative potential of American companies and workers, and ensure America's continued leadership in the creation and use of AI.

Outreach and Development of this Report

This report was developed by a team in the Executive Office of the President including staff from the White House Council of Economic Advisers (CEA), Domestic Policy Council (DPC), National Economic Council (NEC), Office of Management and Budget (OMB), and Office of Science and Technology Policy (OSTP). This report follows a previous report published in October 2016 titled *Preparing for the Future of Artificial Intelligence* and the accompanying *National Artificial Intelligence Research and Development Strategic Plan*, developed by the National Science and Technology Council's (NSTC) Subcommittee on Machine Learning and Artificial Intelligence. This subcommittee was chartered in May 2016 by OSTP to foster interagency coordination and provide technical and policy advice on topics related to AI, and to monitor the development of AI technologies across industry, the research community, and the Federal Government. This report also follows a series of public-outreach activities as a part of the White House Future of Artificial Intelligence Initiative, designed to allow government officials to learn from experts and from the public, which included five co-hosted public workshops, and a public Request for Information (RFI).[2]

This report more deeply examines the impact of AI-driven automation on the economy and policy responses to it. It considers the economic evidence to better understand the lessons from past waves of automation, the impact already caused by the current wave of AI-driven automation and its prospects for the near future, and how AI-driven automation may affect workers in the future. The report also considers policy steps that are needed to address the economic dislocation caused by the arrival of these technologies and to prepare for longer-term trends in the economy caused by AI, automation, and other factors that are systemically disadvantaging certain workers. The report lays out three broad strategies for policymakers to consider.

Further details on the public workshops and the RFI can be found in the October 2016 report, *Preparing for the Future of Artificial Intelligence*.

Introduction

Recent progress in Artificial Intelligence (AI) has brought renewed attention to questions about automation driven by these advances and their impact on the economy. The current wave of progress and enthusiasm for AI began around 2010, driven by three mutually reinforcing factors: the availability of *big data* from sources including e-commerce, businesses, social media, science, and government;[3] which provided raw material for dramatically *improved machine learning approaches and algorithms;* which in turn relied on the capabilities of *more powerful computers.*[4] During this period, the pace of improvement surprised AI experts. For example, on a popular image recognition challenge that has a 5 percent human error rate according to one error measure, [5] the best AI result improved from a 26 percent error rate in 2011 to 3.5 percent in 2015. This progress may enable a range of workplace tasks that require image understanding to be automated, and will also enable new types of work and jobs. Progress on other AI challenges will drive similar economic changes.

Technical innovation has been expanding the American economy since the country's founding. American ingenuity has always been one of the Nation's greatest resources, a key driver of economic growth, and a source of strategic advantage for the United States. Remarkable homegrown innovations have improved quality of life, created jobs, broadened understanding of the world, and helped Americans approach their full potential. At the same time, they have forced Americans to adapt to changes in the workplace and the job market. These transformations have not always been comfortable, but in the long run—and supported by good public policy—they have provided great benefits.
